Buell Powell

My wife and I live on Devil's Backbone where our only source of water is the Trinity Aquifer. Over development has caused the aquifer to significantly decline (please contact Kutcher Drilling in San Marcos for information about the private wells that have gone dry in recent years due to over pumping) and the dumping of treated wastewater threatens to pollute the groundwater that thousands of residents depend on.
Lennar Home's high density housing development permit has WQ0015866001 for the Canyon Ranch development is to dump into the Cow Creek formation and flow into Canyon lake. Their proposed permit WQ0016660001 is to dump treated wastewater into an unnamed tributary that will flow into Potter's creek and on to Canyon lake. This not only means there will be a danger of pollution for the residents that have wells but also for the thousands of residents in several counties that depend on Canyon lake for water. There is also the destruction of the environment and the endangered wildlife in this area.
For these and other reasons these high density developments and WWTPs if approved will present a danger to the environment and residents in this area and the residents in several counties that depend on the aquifer and Canyon lake and should not be approved.
