Ok, I will just send suggestions to you.

https://ehp.niehs.nih.gov/

Have you considered contacting NIH for participation on the committee, they have apparently done a significant amount of research on the effects of phthalates on animals and humans.
An element of use in plastics I didn't hear mentioned is the issue of the stabilizing effect of phthalates with helps breakdown resistance in products, thus making them disposal problems.
Does method of disposed have an impact on their bio-availability? Heavy phthalates are supposed to be stable, does the stability contribute to further problems in their use?
I'm sure that your research was extensive and I may be referencing the same sources, but I may find something new or missed.
Sincerely, Larry
