

## GenPrime, Inc.

As a co-founder of GenPrime and several, small clean, Bio-Technology companies, I am very concerned that the Washington State environment be known as forward thinking and clean. It is important to our business collaborators and to us as residents that Washington remain a leader with a responsible synthesis of innovation in both business and environment.

Coal is filthy and only marginally needed as fuel. Leave it in the ground. All coal brought through Washington and exported to China will return directly to us as CO2 pollution.

China is exporting its coal burning industries in order to reduce its preposterous levels of air pollution. Why should Washington and the US bear the burden of air and water pollution so that China may enjoy the cleaner phases of steel manufacture?

Do Not Ruin our environment for China's economic benefit!
