

## Jess Pusch

This proposal and all relating permits should be denied. The proposed terminal would have detrimental impacts on both the local environment as well as all areas involved in the mining, transportation, and export of the coal. In addition, the contributions to global climate change stemming from this one project alone would be incredibly significant. A range of studies have proven that the proposed destructive coal terminal would severely impair water bodies, negatively impact local indigenous tribes and communities, commercial and recreational fishing, the precious salmon lifecycle, along with increase the impending chance of spills in transport & unloading, and unavoidable coal dust accumulation. This proposed coal terminal can only bring a myriad of negative repercussions to all areas and communities involved.
