Public Education and Outreach (WWA Phase II)

Preliminary draft "fact sheet"

I. Introduction

The Washington Department of Ecology (Ecology) is working on reissuing the Western Washington Phase II Municipal Stormwater Permit. Ecology has prepared preliminary draft sections of permit language and is accepting informal comments on these sections until **11:59 p.m. January 19, 2018. Send your comments to:** <u>http://ws.ecology.commentinput.com/?id=tkx29</u>

Or mail hard copies to:

Municipal Stormwater Comments WA Department of Ecology Water Quality Program PO Box 47696 Olympia, WA 98504-7696

II. Proposal

Ecology proposes to revise the "Public Education and Outreach" (Ed &O) permit section in the Phase I (Special Condition S5.C.10) and Western Washington Phase II Municipal Stormwater Permits (Special Condition S5C.1.). While the proposed changes to both Permits are similar, this section is tailored to the proposed changes for the Phase II Permit - there is a separate preliminary draft section and overview for Phase I. The revisions focus on providing clarity to the components that make up the public education and outreach program:

- 1. general awareness,
- 2. behavior change, and
- 3. stewardship opportunities.

The general awareness and stewardship sections stay largely the same as in the 2013 permit, with language added to help clarify how many audiences and BMPs must be targeted, and how to create stewardship opportunities. The behavior change section is revised and clarified to set specific expectations for the process that must be followed in order to encourage changes in behavior.

III. What are the proposed permit changes?

S5.C1. Introductory paragraph: revised the formatting and added language to clarify the three-prong approach to the public education and outreach program, each component (e.g. building awareness, behavior change, and stewardship) was included in the 2013 permit. Additional language to emphasize and clarify how the program can be a regional effort as well as an individual permittee program.

S5.C.1.a: Specific language changes to clarify requirements, and that the selection of target audiences and subject areas must be based on addressing a local water quality priority.

S5.C.1.a.i: Language clarifications that this is the "general awareness" requirement, and the minimum level of effort.

S5.C.1.a.i.(a): Revisions to clarify target audiences and subject areas. Subject area: *impacts of illicit discharges and how to report them* was removed as this topic is a requirement of the IDDE section.

S5.C.1.a.ii: Language clarifications that this is the "behavior change" requirement, and the minimum level of effort.

S5.C.1.a.ii.(a): Revisions to clarify target audiences and BMPs. General public, was removed as a target audience as this category is too broad to focus a behavior change program. Behavior change programs should target a more specific audience so that it is easier to discern barriers and opportunities for the desired behavior. Target audiences were combined in this section for clarity. Source control BMPs is added a BMP to promote.

S5.C.1.b: Requires a new evaluation of the on-going behavior change program to determine program effectiveness and the next steps. Using this evaluation, Permittees will design the next iteration of the program using community-based social marketing methods to develop a strategy and schedule. Three different options to proceed are offered:

i. Develop a strategy and schedule to more effectively implement the existing program, or

This option is to refine the existing, ongoing, behavior change program with the *inclusion* of community based social marketing methods. This includes, if not part of the program already, a plan to evaluate the effectiveness of the program *going forward*.

ii. . Develop a strategy and schedule to expand the existing program to a new target audience or BMPs; or

This option is to expand the existing, ongoing behavior change program to a new audience with the same BMP, or same audience but a new BMP may be a better fit or more effective at achieving the desired behavior change.

iii. <u>De</u>velop a strategy and schedule for a new target audience and BMP behavior change campaign.

This option is to develop a new approach for the behavior change program, focusing on a new audience and BMP than the existing program.

Solely relying on providing information is not adequate to changing the behavior of individuals. Community-based social marketing is a Best Management Practice to promoting and achieving behavior change. Community-based social marketing uses tools and findings from social psychology to discover the perceived barriers to behavior change and ways of overcoming these barriers (McKenzie-Mohr 2011). Community-based social marketing is pragmatic and generally involves:

Page **2** of **8**

Commented [TC1]: To present all the E&O requirements in the same place in the permit, we recommend considering moving the illicit-related E&O requirements to S5.C. Particularly given that there are still mention of IDDE in S5.C.1.a.ii.(2)(a).

- identifying the barriers for a specific demographic (target audience) to adopting a desired behavior
- developing and piloting a program to overcome these barriers
- implementing the program across a community
- evaluating the effectiveness of the program

S5.C.1.c: provides the date by which the strategy developed under_S5.C.1.b must begin to be implemented. This does not necessarily mean when a new or refined program must roll out to the target audience, but may include the start of a survey or focus groups of the target audience or other early tasks that inform the behavior change program.

S5.C.1.d: Provides the due date to report on the effectiveness of the strategy and any potential changes to improve effectiveness of the behavior change program. This provision provides time for the program to develop and be implemented, with time to evaluate and report on the effectiveness of the behavior change program – or how well did the target audience <u>receiverespond to</u> the message and change their behavior to the desired actions?

Please consider and comment on whether the timeframe provided above in this preliminary draft is appropriate and compliance with this schedule is feasible. If not, please explain.

S5.C.1.e: Describes the stewardship element of the program. Revisions added for clarification.

IV. Why these proposed changes to Ed & O?

Ecology received input from Permittees, the regional education and outreach group- STORM, and environmental groups, which recommend changes to the education and outreach program. Significant issues raised include:

- the need to focus the program on known local water quality problems,
- refine the Phase I behavior change section specifically because this section of the permit requires significant time and resources to create and implement behavior change campaigns for each of the target audiences and best management practices (BMPs). The requirement to address the full list was diluting the effectiveness of the program overall.

After considering the comments, existing permit language, as well as permit submittals related the to the education and outreach programs, Ecology finds it important to align the Phase I and Phase II permit requirements so that partnerships between Phase I and Phase II permittees can continue to leverage resources, as well as provide consistent programs to the regions. The preliminary permit language clarifies that the selection of the target audiences and topics be based on local water quality issues. In order to instill consistency in the process for implementing a behavior change campaign, community-based social marketing, a best management practice for establishing behavior change, is called out specifically as the process to follow.

Page 3 of 8

Commented [TC2]: Depending on the target audience, this may or may not be applicable across the entire community. For example, the target audience may be geographically defined.

V. Resources on CBSM

- <u>Getting Your Feet Wet with Social Marketing</u> by Jack Wilbur, Utah Department of Agriculture and Food
- Community Based Social Marketing based on the book by Doug McKenzie-Mohr
- <u>Tools of Change</u> offers specific tools, case studies, and a planning guide for helping people take actions and adopt habits that promote health and/or are more environmentally-friendly.
- Social Norms: An Underestimated and Underemployed Lever for Managing Climate Change by Vladas Griskevicius, University of Minnesota, Robert B. Cialdini, Arizona State University, and Noah J. Goldstein, University of Chicago -This paper reviews numerous field experiments to "harness the power of social norms to influence proenvironmental behavior."
- Social Marketing Strategies for Stormwater Business Outreach: Summary of Recent Research in the Puget Sound Region: Assistance for Developing and Implementing Local Programs - This report summarizes findings from six different formative research projects recently completed in the Puget Sound region focusing on business practices that can pollute stormwater runoff. The report includes a summary of recommended and not recommended outreach strategies that have been tested through surveys, interviews, and focus groups as well as some that have been piloted and evaluated.

10/3/17

1. Public Education and Outreach

The SWMP shall include an education and outreach program designed to:

- Build general awareness about impacts from, and methods to address and reduce stormwater runoff;
 Affect behavior change to reduce or eliminate behaviors and practices
- that cause or contribute to adverse stormwater impacts; and Create stewardship opportunities that have the potential to address and reduce stormwater runoff and which encourage community engagement in

reduce stormwater runoff and which encourage community engagement in (not necessarily awareness or education about) BMPs and related civic behaviors.

reduce or eliminate behaviors and practices that cause or contribute to adverse stormwater impacts and encourage the public to participate in stewardship activities. The education program may be developed and implemented locally or regionally.Permittees may meet these requirements individually or as a member of a regional group. Regional collaboration on general awareness or behavior change programs, or both, includes Permittees developing a consistent message, determining best methods for communicating the message, and when appropriate, creating strategies to affect behavior change. Each Permittee shall implement what is developed regionally at the local jurisdiction or modified and implemented to account for variances at the local level.

The minimum performance measures are:

- a. Each Permittee shall provide-implement an education and outreach program for the area served by the MS4. The program shall be designed to educate target audiences about the The program design must be evidence-based, drawing upon information about the local environment and audience characteristics as much as possible to identify high priority goals, target audiences, subject areas, and/or BMPs. When local information is lacking, extrapolating from regional, national, or other sources may be appropriate. Permittees should consider using the following sources of information: onlocal water quality deficiencies, and-demographic information of target audiences, survey data, and qualitative research (e.g., interview and focus groups, observations, and research findings).-to identify high priority targetaudiences, subject areas, and/or BMPs, stormwater problem and provide specific actions they can follow to minimize the problem.¹
 - <u>General awareness</u>. To build general awareness, Permittees shall select from the following at a minimum one target audiences and one subject areas from either (a) or (b):
 - (a) <u>Target audiences:</u> General public (including school age children), and businesses (including home-based, and mobile

Page **5** of **8**

Commented [TC3]: Recent findings in the field of environmental communication have called into question the efficacy of efforts to raise awareness on intended positive outcomes. Knowledge deficit is no longer considered to be the primary reason for resistance to behavior change.

In fact, unintended consequences such as "backfire" or "boomerang" effects can occur, where audiences become more polarized and resistant to change. While not much research specific to stormwater has been done, this has been frequently noted in the topic area of climate change.

Recommend not requiring general awareness campaigns by permittees, but instead focus on how best to achieve desired behavior change. Let permittees do the analysis first to decide if increasing awareness would help change behavior.

Commented [TC4]: If not this language, we suggest elaborating to the purpose of creating stewardship opportunities.

Commented [TC5]: This seems like it could have negative outcomes if the messages and approach developed regionally are not as applicable to the audiences and demographics at specific jurisdictions. Thurston County hopes there would be allowance for jurisdictions to modify regional messages, approaches, and materials to fit their own needs.

Commented [TC6]: Please consider an additional option that allows permittees to choose priorities that are proactive in preventing known high-risk stormwater-related impacts from occurring. For example, E&O-related program efforts related to supporting permit's *Source Control Program for Existing Development*.

Commented [TC7]: Designing programs based on local water quality could be better supported if the Permit's S8 allowed greater flexibility for options to support local monitoring to diagnose stormwater-related water quality issues as well as evaluate the effectiveness of local programs targeted to those stormwater-related water quality issues.

10/3/17

businesses). Subject areas:

- General impacts of stormwater on surface waters.
- Impacts from impervious surfaces.

•Impacts of illicit discharges and how to report them.

¹ New Permittees shall begin implementing the requirements of S5.C.1 no later than August 1, 2015.

10/3/17

Low impact development (LID) principles and LID BMPs.

•Opportunities to become involved in stewardship activities.

- (b) <u>Target audiences:</u> Engineers, contractors, developers and land use planners. <u>Subject areas:</u>
 - Technical standards for stormwater site and erosion control plans.
 - LID principles and LID BMPs.
 - Stormwater treatment and flow control BMPs/facilities.
- ii. <u>Behavior change.</u> To effect behavior change, Permittees shall select, at <u>a minimum, from the following one</u> target audiences and BMP(s):
 - (a) <u>Target Audiences: General publicResidents, landscapers,</u> property managers/owners, (which may include school age children), businesses (including home-based and mobile businesses). <u>BMPs:</u>
 - Use and storage of automotive chemicals, hazardous cleaning supplies, carwash soaps and other hazardous materials.
 - Equipment maintenance.
 - Prevention of illicit discharges.

Residents, landscapers and property managers/owners

- Yard care techniques protective of water quality.
- Use and storage of pesticides and fertilizers and other household chemicals.
- Carpet cleaning.
- <u>and aA</u>uto repair and maintenance.
- Vehicle, equipment and home/building maintenance.
- Pet waste management and disposal.
- LID principles and LID BMPs.
- Stormwater facility maintenance.

•Dumpster and trash compactor maintenance.

Page **7** of **8**

Commented [TC8]: General awareness doesn't seem like the appropriate reference given the permittees are directed to select a specific target audience and subject area. Thurston County recommends removing the requirement for awareness campaigns or at least make it optional as it could be at odds with behavior change goals.

Commented [TC9]: Two separate bullets as these are two separate business sectors. Carpet cleaning is a mobile type business and auto repair maintenance is generally not a mobile business. The potential for polluting activities varies greatly between these two sectors. Mobile vehicle detailing businesses could be more easily grouped with carpet cleaning businesses.

10/3/17

•(Audience specific) Source control BMPs (refer to S5.C.X).

b. No later than April 31, 2020 [~nine mos from eff. Date], each Permittee shall conduct a new evaluation of the effectiveness of the ongoing behavior change program (required under S5.C.1.a.ii of the 2013-2018 Permit). Permittees shall document lessons learned and recommendations for which option to select from S5.C.1.b.i-iii. Based on this evaluation, [within 18 months from eff. date] by February 1, 2021, each Permittee shall use community-based social marketing methods ², including the development of a program evaluation plan), or equivalent, to:

- i. Develop a strategy and schedule to more effectively implement the existing program; or
- ii. Develop a strategy and schedule to expand the existing program to a new target audience or BMPs; or
- iii. Develop a strategy and schedule for a new target audience and BMP behavior change campaign.
- c.<u>No later than April 1, 2021, begin to implement the strategy developed in</u> <u>S5.C.1.b.</u>

b-d.No later than March 31, 2024, evaluate and report on the changes in understanding and adoption of targeted behaviors resulting from the implementation of the strategy and any program changes neededto the program in order to beimprove its more-effectiveness; describe the strategies and process to achieve the results.

Note to reader: Please consider and comment on whether the timeframe provided above is appropriate and compliance with this schedule is feasible. If not, please explain.

e.e.Stewardship. Each Permittee shall create stewardship opportunities and/or partner with existing organizations <u>(including non-permittees)</u> to encourage residents target audiences to participate in <u>hands-on stormwater management-</u> related activities or events planned and organized within the **Commented [TC10]:** Highly likely that behavior change programs might be more effective if they are not ongoing. We prefer to have the option to do time-limited campaigns or ongoing campaigns based on jurisdictional evaluation for what they believe will be best designed for effective behavior change.

Commented [TC11]: Does this mean CBSM or equivalent methods? CBSM may not be appropriate in all situations, so we think allowing for some leeway would be beneficial.

Commented [TC12]: It may be difficult for some jurisdictions to begin to implement a new strategy by April 2021 if they are on bi-annual budgets. They could certainly try to project budget costs, but until the evaluation is completed a final budget would be hard to calculate.

Conducting a robust evaluation and identifying strategies/program changes to improve effectiveness is time-consuming and expensive. Thurston County would not suggest anything less than the almost three years proposed to begin implementing and evaluating. 3 ½ years would be better as we don't want to do a sub-par evaluation effort.

Commented [TC13]: Too narrow; could also engage with businesses, visitors, and organizations.

²Community-based social marketing: A systematic way to change the behavior of communities to reduce their impact on the environment. Realizing that providing information is usually not sufficient to initiate behavior change, community-based social marketing uses tools and findings from social psychology to discover the perceived barriers to behavior change and ways of overcoming these barriers.

10/3/17

<u>community and local areas</u>, such as: stream teams, storm drain marking, volunteerwater quality monitoring, riparian plantings, and education activities BMP installation and/or maintenance, or civic engagement or community outreach related to stormwater issues.

d.Each Permittee shall measure the understanding and adoption of the targeted behaviors for at least one target audience in at least one subject area. No later than February 2, 2016, Permittees shall use the resulting measurements to direct education and outreach resources most effectively, as well as to evaluate changes in adoption of the targeted behaviors.³ Permittees may meet this requirement individually or as a member of a regional group. **Commented [TC14]:** Not an activity in and of itself, but Stream Team participants may carry out some of these activities.

Commented [TC15]: i.e., volunteers who take action to engage others.

³ By no later than August 1, 2017, new Permittees shall begin using the results of measurements to direct education— Page 9 of 8

10/3/17 and outreach resources more effectively, as well as to evaluate changes in adopted behaviors.

Page **10** of

Illicit Discharge Detection and Elimination(IDDE)

Phase I and Western Washington Phase II Municipal Stormwater Permits

Proposed approach to update the **IDDE tracking and reporting requirements** for the 2019 permit reissuance.

I. Introduction

The Washington Department of Ecology (Ecology) is working on reissuing the Phase I and Western Washington Phase II Municipal Stormwater Permit. Ecology prepared preliminary draft permit language or narrative descriptions of specific permit sections and is accepting informal comments until 11:59p.m., January 19, 2018. Send your comments to: <u>http://</u>ws.ecology.commentinput.com/?id=tkx29

Or mail hard copies to:

Municipal Stormwater Comments WA Department of Ecology Water Quality Program PO Box 47696 Olympia, WA 98504-7696

II. Proposal

This is a summary of several changes Ecology is proposing related to Permittees' IDDE permit requirements. Proposed permit language for the entire IDDE permit section will be released in spring 2018.

Proposed changes to Phase II permit requirements

1. Move mapping requirements from S5.C.3 to a new mapping section under S5.C..

Proposed changes to Phase I and WWA Phase II permits:

2. Proposed new Phase II S5.C.3.f / Phase I S5.C.8.g language in red:

Recordkeeping: Each Permittee shall track and maintain records of the activities conducted to meet the requirements of this section. In the annual report, each permittee shall submit data for all of the potential confirmed illicit discharges, including spills and illicit connections, found by or reported to the Permittee during the previous calendar year. The summary shall include the information and formatting specified in WQWebIDDE. Applicable data shall be reported for all potential confirmed incidents, regardless of whether G3 notification was required, whether an-illicit discharge was confirmed, or whether follow-up action was required by the Permittee. Each permittee may either use their own system or WQWebIDDE for recording this data. Final submittal must follow the schema described in WQWebIDDE.

Commented [TC1]: Reporting and assessing confirmed illicit discharges has value in identifying reoccurring problem areas, trends, and areas to focus preventive measures. In contrast, "potential illicit discharges" constitutes a very wide spectrum of scenarios and has little diagnostic value (the text box below states: "Ecology wants the requirement to be meaningful and useful."). Does Ecology feels there value in reporting the number of incidents that turned out to be false positives? If so, only questions 1-6 would be able to be answered for "potential illicit discharges". Thurston County responds to many reported "spills" that lead to nothing found or unable to locate.

Page **1** of **2**

Phase I and Western WA Phase II Municipal Stormwater Permit Preliminary Draft Permit Section: IDDE tracking and reporting 10/3/17

Note to readers: An IDDE incident tracking and reporting annual report question is in the current permit. Ecology issued guidance for permittees to meet this requirement but it was used by few permittees. Ecology wants the requirement to be meaningful and useful. The Stormwater Work Group stakeholder committee involved permittees in providing helpful definition and clarity to the expected reporting requirements. Ecology's IT department is building a form in the web portal that is primarily intended for use by permittees with smaller numbers (approximately <50) of incidents. Permittees with their own data bases should have their IT departments take a look at the data schema provided with this informal draft permit language.

3. Revised annual report question Phase II Q20/ Phase I Q48:

Q20/48. Attach a summary of a zipped xml file with data describing the actions taken to investigate, characterize, trace and eliminate each <u>potential</u> illicit discharge found by or reported to the permittee. For each <u>confirmed</u> illicit discharge, include a description of actions according to the required timeline per <u>S5.C.3.d.vi/S5.C.8.d.vi/</u>. The submittal must include all of the applicable information and must follow the schema described in WQWebIDDE.

4. Delete/remove annual report questions (PH II/PH I: Q15b/44b, Q19/47, and Q61/87.

Commented [TC2]: The Stormwater Work Group stakeholder committee wasn't the best "informed" forum for this topic. ROADMAP would have been a far better venue to initiate the conversation as those participates implement these responsibilities. The caveat for both groups, is that participation is primarily limited to permittees in the Puget Sound area and thus would not likely capture southwest WA permittee and those in the extreme outer reaches of the Puget Sound basin where travel time to attend meeting becomes prohibitive.

Commented [TC3]: Thurston County developed its database attempting to capture the best of the approaches/best practices used by the Center of Watershed Protection; the GROSS grant funded *Illicit Connection & Illicit Discharge Field Screening & Source Tracing Guidance Manual* prepared for Ecology by King County, Washington Stormwater Center, and Herrera Environmental Consultants; and the SIDAR form.

Taking this action represents a significant proactive step in the County's ability to document, assess, and report on illicit discharges and illicit connections. Changing Thurston County's database schema to fully reflect what proposed in the preliminary draft represents a huge cost, would involve a significant investment of time, and result in a disconnect of the information the County collected to date using our existing schema. In addition, incurring such costs risks sending a message that there are potentially high costs to taking responsible proactive measures.

Adding additional fields to our existing schema would be less disruptive, but removing/replacing existing fields would break links to historical data records. IDDE Reporting Schema Shane Homan for Karen Dinicola V0.2 Page 2: English Page 5: Schema

Page 17: Example

IDDE Questions and Answers

1. Jurisdiction name (Permit Number)

- 2. Incident ID assigned by jurisdiction
- 3. Date incident reported
- 4. Date to begin response
- 5. Date to end response
- 6. Date of final resolution
- Transferred to another party?
- 7. Discharge to MS4?

- Yes

- a. Estimated Quantity
 - Unknown
 - Sheen
 - Less than 10 Gallons
 - 10 to 100 Gallons
 - 100 to 1,000 Gallons
 - 1,000 to 10,000 Gallons

 - Greater than 10,000 Gallons
- b. Discharge Frequency
 - Continuous or Ongoing
 - Intermittent
 - One-Time

- No

- Discharge Cleaned Up prior to entering the MS4
 - Discharge to Combined sewer
 - Discharge to Private or other sewer
- Other
 - Explain

- Unknown

- 8. G3 notification?
 - Yes
 - ERTS case number
 - No
- 9. Incident location
 - Address
 - Street
 - City
 - State
 - Zip
 - Nearest Intersection
 - Tax Parcel
 - Latitude/Longitude
 - Latitude
 - Longitude
- 10. How was the incident discovered?
- pollution hotline
 - (includes phone and/or web and/or mobile app)
 - direct report to staff
 - staff referral
 - other agency referral
 - ERTS
 - IDDE field observation
 - inspection
 - business
 - construction
 - catch basin or manhole
 - outfall or other MS4
 - stormwater BMP
 - other
 - Explain
 - other
- explain 11. Pollutants identified:

Commented [TC4]: As proposed, this doesn't allow for documenting spills of solids.

Commented [TC5]: This is less granularity that what Thurston County currently captures. Most spills larger than five gallons are able to be quantified based on the known volume of the substance being transported.

Commented [TC6]: There would be no discharge if cleaned up prior to entering the MS4.

Commented [TC7]: Capturing the latitude/longitude information, as is Thurston County's practice, makes recording the address and tax parcel unnecessary. Requiring them all seems unnecessarily redundant.

- none found
- unconfirmed
- not identified
- unspecified
- vehicle oil, fuel, or other lubricant
- antifreeze or other coolant
- sediment/soil
- sewage/septage
- solid waste/trash
- food waste or oil
- yard waste or other plant or wood waste
- household or industrial chemical
 - Explain
- carpet cleaning waste
- fertilizer

- pesticide or herbicide
- bacteria
- pet waste
- soap/detergent
- fire-fighting foam
- other or unknown foam
- heating oil or kerosene
- roofing or road tar
- cement, concrete, lime, or plaster
- paint (oil based)
- paint (latex)
- PCBs
- refrigerant
- chlorinated water
- other
 - Explain
- 12. Source or cause:
- n/a
 - allowable discharge
 - Diverted stream flow
 - Flow from riparian habitat or wetland
 - Uncontaminated ground water or spring water
 - Foundation or footing drain
 - Uncontaminated water from crawl space pump
 - Air conditioning condensation
 - Irrigation water from agricultural source
 - Emergency firefighting
 - conditionally allowed discharge
 - Potable water
 - Water line flushing or testing
 - Lawn watering or other irrigation
 - Dechlorinated pool/spa water
 - Street/sidewalk wash water
- not identified
- illicit connection
- dumping
- spill

_

- vehicle collision/accident
- construction activity
- construction BMP failure
- structural BMP failure
- runoff due to drainage or grade conditions
- stormwater or flood water
- groundwater pumping
- broken or clogged water or sewer line
- septic system
- leaking or abandoned container/dumpster
- non-emergency firefighting or training
- fueling
- auto repair
- vehicle washing
- vehicle leakage/fluids
- equipment cleaning
- pressure washing
- drive-thru
- mobile business
- retail operations
- restaurant
- logging
- livestock
- other
- Explain
- 13. Source tracing: - n/a
- 11/a
- visual observation

- map analysis

Commented [TC9]: Significantly long pick lists are hard to navigate and display, especially on mobile devices. Thurston County classifies pollutants in higher level categories and then further defines the specifics in the comments if known or determined through further analysis after the cleanup. The proposed schema approach tries to be all-inclusive and should instead be grouped into higher level level categories.

Commented [TC10]: By definition, these would not constitute an IDDE, so it shouldn't need documenting.

Commented [TC11]: Significantly long pick lists are hard to navigate and display, especially on mobile devices. Thurston County classifies pollutants in higher level categories and then further defines the specifics in the comments if known or determined through further analysis after the cleanup. The proposed schema approach tries to be all-inclusive and should instead be grouped into higher level categories.

- further inspection or reconnaissance
- indicator testing
- dye testing
- pressure testing
- smoke testing
- video inspection
- canine detection
- optical brightener
- sand bagging
- smell/odor

other

- Explain
- 14. Indicator testing:
- n/a

Commented [TC12]: Note: Yellow highlighted text indicates that we capture this in our IDDE database.

Commented [TC13]: What is this determining?

Commented [TC14]: How many jurisdictions in WA have access to a canine detection dog?

- flow/discharge
- sheen/oil
- floatables
- detergent or surfactants
- <mark>- ammonia</mark>
- color
- odor
- pH
- temperature
- turbidity
- hardness
- nitrates
- <mark>- potassium</mark>
- specific conductivity

bacteria chloride/chlorine

- fluoride
- carbon monoxide
- hydrogen sulfide

other

- Explain

15. Correction/elimination methods:

no action needed

- Explain
- clean-up
- education/technical assistance
- add or improve source control BMP
- focus on structural
- behavioral or BMP operation modification
- focus on operational
- enforcement:
 - verbal notice
 - written warning
 - correction notice
 - stop work order
 - legal notice
 - penalty or fine
- referred to other agency or department
- follow-up or further investigation
- problem not abated
- Explain
- Other - Explain

16. Field notes, explanations, and/or other comments:

Commented [TC15]: Is this getting at adding or improving source control BMPs?

Commented [TC16]: Doesn't question 6 address this?

Commented [TC17]: Thurston County would not close this incident out if it required further follow-up or investigations.

Mapping requirements

Phase I and Western Washington Phase II Municipal Stormwater Permits Preliminary draft "fact sheet"

I. Introduction

The Washington Department of Ecology (Ecology) is working on reissuing the Phase I and Western Washington Phase II Municipal Stormwater Permits. Ecology prepared preliminary draft permit language or narrative descriptions of specific permit sections and is accepting informal comments until 11:59 p.m., January 19, 2018. Send your comments to: http://ws.ecology.commentinput.com/?id=tkx29

Or mail hard copies to:

Municipal Stormwater Comments WA Department of Ecology Water Quality Program PO Box 47696 Olympia, WA 98504-7696

II. Proposal

In early spring, Ecology announced that we are considering adding an outfall reporting standard requirement to the permits. We proposed some minimum attribute information and stated that Ecology would load the information received into the Water Quality Atlas. Based on comments received and Ecology's own internal procedures, we are proposing a more step-wise approach to addressing outfall mapping and reporting by requiring the collection of more specific information (i.e. outfall size and material).

Ecology will commit to working with permittees to voluntarily associate outfall data with NHD reach and measure and load into the Water Quality Atlas during the 2019-2024 permit cycle.

We have made some additional refinement and enhancements to the mapping requirements, described below.

III. What are the proposed permit changes?

The proposed permit edits and approach:

- Phase I
 - Begin mapping the tributary conveyances to outfalls (with a size of 24" or greater) in rural areas of the county not previously mapped in the previous permit cycle. Previous permit requirements only required the mapping of these features in the urban/higher density rural sub-basins. Comments on the timeframe provided are requested.
- Phase II
 - Create new stand-alone permit section for mapping separate from the IDDE permit section. This follows the format of the Phase I permit and creates a more consistent permit structure for western Washington.

Page 1 of 6

Phase II Municipal Stormwater Permit Preliminary Draft Permit Section: Mapping 10/3/17

- Make electronic format with fully described <u>mapping standards required</u> (electronic format is currently preferred) with a phase-in period for compliance.
- Phase I and II
 - Introduce new term "permanent stormwater facilities" to correct error in 2013 permits that inadvertently narrowed the scope of mapping (and operations and maintenance).
 - Proposed definition: Permanent stormwater facilities are structures or devices designed or used to control stormwater flows, or remove pollutants from stormwater, or both.
 - This proposed term will be used in the Operation and Maintenance section for the Phase I permit to address inspections of municipally owned facilities, as well as facilities regulated by the Permittee. In the Phase II permit, this term will be used to clarify inspections of municipally owned or operated facilities.
 - Retain reference to an example <u>description of standards</u> and enhance the example with new guidance and a sample geodatabase (This will be provided with the formal draft permit in 2018).
 - As outfall records are updated or added, additional information describing the size of the outfall and the material that it is made out of must be added. This does not mean that Permittees must re-survey all known MS4 outfalls by the date included in the preliminary permit language, but that as this information becomes available to the Permittee, through inspections, maintenance, project approvals etc., this attribute information would be added to the outfall records.
- Proposed permit edits are shown below in redline.

IV. Mapping guidance

Ecology received a number of questions from interested stakeholders and Permittees asking clarifying questions to the mapping requirements. In addition to the proposed preliminary draft permit language, we have developed draft mapping guidance (attached) that is also available for review and comment. Ecology would appreciate comments on this guidance in order to make it useful and helpful.

Phase II Municipal Stormwater Permit Preliminary Draft Permit Section: Mapping 10/3/17

PHASE II PERMIT - NEW SECTION - S5.C.0 (Note: Specific special condition number will be determined for the formal draft permit, it will not remain "0")

1. The SWMP shall include an ongoing program for mapping and documenting the MS4.

The minimum performance measures are:

- Ongoing Mapping: Each Permittee shall maintain mapping data for the features listed below of the MS4 shall continue on an ongoing basis.¹ MS4 maps shall beperiodically updated. Update maps if necessary to meet the requirements of this section no later than February 2, 2018. At a minimum, maps shall include the following information:
 - i. Known MS4 outfalls and known MS4 discharge points.
 - ii. Receiving waters, other than ground water.
 - iii. <u>Permanent Ss</u>tormwater treatment and flow control BMPs/facilities owned or operated by the Permittee.
 - iv. Geographic areas served by the Permittee's MS4 that do not discharge stormwater to surface waters.
 - iii.v. Tributary conveyances to all known outfalls and discharge points with a 24 inch nominal diameter or larger, or an equivalent cross-sectional area for non-pipe systems. The following attributes shall be mapped:
 - (a) Tributary conveyance type, material, and size where known.
 - (b) Associated drainage areas.
 - (c) Land use.
 - vi. Connections between the MS4 owned or operated by the Permittee and other municipalities or public entities.
 - iv.vii. All connections to the MS4 authorized or allowed by the Permittee after February 16, 2007.
- b.New Mapping: Each Permittee shall complete the following mapping no later than August 1, 2021.
 - i. For all known MS4 outfalls, the following attributes shall be mapped: size and material, where known.

¹ New Permittees shall meet the requirements to map the MS4 according to S5.C.3.a no later than February 2, 20182024, except where otherwise noted in this section.

² New Permittees shall meet the requirements of S5.C.3.a.vii. after August 1, 2013LINK TO CODE UPDATE for all connections to the MS4 authorized after August 1, 2013LINK TO CODE UPDATE.

Phase II Municipal Stormwater Permit Preliminary Draft Permit Section: Mapping 10/3/17

> Connections between the MS4 owned or operated by the Permittee and other municipalities or public optities.

Geographic areas served by the Permittee's MS4 that do not discharge stormwater to surface waters:

b.c. -Beginning August 1, 2021, the required format for mapping is electronic with fully described mapping standards. An example description is available on Ecology's website.

e-d. To the extent consistent with national security laws and directives, each Permittee shall make available to Ecology, upon request, MS4 map(s)available maps depicting the information required in S5.C._X3.a.i-through viib, above. The preferred formatfor mapping will be anis electronic format with fully described mapping standards. An example description is available on Ecology's website.

e. Upon request, and to the extent appropriate, Permittees shall provide mapping information to federally _recognized Indian Tribes, municipalities, and other Permittees. This permit does not preclude Permittees from recovering reasonable costs associated with fulfilling mapping information requests by federally _recognized Indian Tribes, municipalities, and other Permittees.

Page 4 of 6

Phase I Municipal Stormwater Permit Preliminary Draft Permit Section: Mapping 10/3/17

PHASE I PERMIT - S5.C.2

2. Municipal Separate Storm Sewer System Mapping and Documentation

The SWMP shall include an ongoing program for mapping and documenting the MS4.

Minimum performance measures:

- a. Ongoing Mapping: Each Permittee shall maintain mapping data for the features listed below.
 - i. Known MS4 outfalls and discharge points.
 - ii. Receiving waters, other than ground water.
 - iii. <u>Permanent Ss</u>tormwater treatment and flow control BMPs/facilities owned or operated by the Permittee <u>including all connections to tributary</u> conveyances (mapped in accordance with this section) and all associated emergency overflows.
 - iv. Geographic areas served by the Permittee's MS4 that do not discharge stormwater to surface water.
 - v. Tributary conveyances to all known outfalls and discharge points with a 24inch nominal diameter or larger, or an equivalent cross-sectional area for non-pipe systems. For Counties, this requirement applies to urban/higher density rural sub-basins. For Cities, this requirement applies throughout the City. The following attributes shall be mapped:
 - (a) Tributary conveyance type, material, and size where known.
 - (b) Associated drainage areas.
 - (c) Land uses.
 - vi. Connections between the MS4 owned or operated by the Permittee and other municipalities or other public entities.
 - vii. All connections to the MS4 authorized or allowed by the Permittee after February 16, 2007.
 - viii. Existing, known connections over-greater than or equal to 8 inches in nominal diameter to tributary conveyances mapped in accordance with S5.C.2.a.v. For Counties, this requirement applies to the area of the county within urban/higher density rural sub-basins mapped under the previous permit. For Cities, this requirement applies throughout the City.

Page 5 of 6

Phase I Municipal Stormwater Permit Preliminary Draft Permit Section: Mapping 10/3/17

> b.New Mapping: Each Permittee shall complete the following mapping. no later than -August 1, 2021.

- viii.i. For all known MS4 outfalls, the following attributes shall be mapped: size and material, where known, no later than August 1, 2021.
- ix.ii. No later than four years from the effective date of this permit, Counties shall map tributary conveyances, as described in S5.C.2.a.v., for areas not mapped under the previous permit cycle.

Note to reviewers: Please consider and comment on whether the timeframe provided above is appropriate and compliance with this schedule is feasible. If not, please explain.

New Mapping: Each Permittee shall complete the following mapping no later than December 31, 2017.

 Counties shall map tributary conveyances, as described in S5.C.2.a.v, for any urban/higher density rural sub-basins not mapped under the previous permit.

Counties shall map existing, known connections greater than 8 inches in nominal diameter to tributary conveyances mapped in accordance with S5.C.2.b.i.

Each Permittee shall map existing, known connections equal to 8 inches in nominal diameter to tributary conveyances mapped in accordance with 5.5.C.2.

- Each Permittee shall map connections between stormwater treatment and flow control BMPs/facilities and tributary conveyances mapped in accordance with S5.C.2. The Permittee shall map all associated emergency overflows.
- c. The required format for mapping is electronic with fully described mapping standards. An example description is available on Ecology's website.

b.d. To the extent consistent with national security laws and directives, each Permittee shall make available to Ecology, upon request, available maps depicting the information required in S5.C.2.a and b, above. The required format for mapping is electronic with fully described mapping standards. An example description is available on Ecology's website.

e.e. Upon request, and to the extent appropriate, Permittees shall provide mapping information to federally recognized Indian Tribes, municipalities, and other Permittees. This permit does not preclude Permittees from recovering reasonable costs associated with fulfilling mapping information requests by federally recognized Indian Tribes, municipalities, and other Permittees.

Draft Mapping Guidance for Phase I and Western Washington Phase II NPDES Municipal Stormwater Permittees

Table of Contents

I.	Purpose of this document2
II.	Know your MS42
III.	Permit mapping terms and definitions - with guidance4
	Note to reader
IV.	More guidance on features required to be mapped8
v.	Not required, but recommended features to map9
VI.	MS4 mapping scenarios

Ecology is accepting written comments on this draft guidance until 11:59 p.m. January 19, 2018.

Please submit written comments to: http://ws.ecology.commentinput.com/?id=tkx29_or mail hard copy comments to:

Municipal Permit Comments Washington State Department of Ecology PO Box 47600 Olympia, WA 98504-7600

Purpose of this document:

This document provides general guidance to the mapping requirements found in the current Phase I and Western Washington (WWA) Phase II Municipal Stormwater Permits (Permit), as well as in the <u>proposed 2019 draft Permits</u>¹-Although the specific mapping requirements between the two permits vary slightly, the terms used are the same. The following provides additional guidance on –mapping terms and definitions, and example municipal separate storm sewer system (MS4) scenarios, including how features should be mapped in accordance with the permit requirements.

II. Know your MS4:

.

The mapping requirements found in the permit serves the purpose of supporting implementation of the permit requirements for:

- Illicit Discharge Detection and Elimination (IDDE),
 - including responding to and notification of spills,
- Operation and maintenance of the stormwater infrastructure,
- Informing programs of potential pollutant sources e.g., Public education and outreach, source control inspections, and local monitoring programs.

To be successful, Permittees must have complete and accurate knowledge of what is regulated under this permit.

Mapping requirements apply only to the Permittee's municipal stormwater system.

Permittees must maintain an on-going mapping program to keep existing maps of their MS4 up-to-date. The 2013 Permits required Permittees to update their MS4 maps by a certain date² to include all the new mapping features. The proposed 2019 permit will also include a specific date for Permittees to update their MS4 mapping to meet new requirements. Permittees should establish their own protocols for maintaining and updating their MS4 mapping to best support permit implementation.

Table 1 summarizes the required features to map as described in the Permits, as well as proposed mapping for the 2019 Permits. Refer to the current permit language (and proposed preliminary draft language) for a complete description of the mapping requirements.

MS4 mapping and documentation requirements are included in the 2013 Phase I permit at:

• S5.C.2 for Clark, King, Pierce and Snohomish Counties and City of Tacoma and City of Seattle

¹ Proposed permit changes to the mapping requirements are shown as <u>underlined red text and strikethrough text</u>.

- S6.D.3.c for secondary permittees
- S6.E.3.c for the Ports of Seattle and Tacoma

MS4 mapping and documentation requirements are included in the 2013 Phase II permit at:

- S5.C.3 for Phase II permittees
- S6.D.4.c for secondary permittees

For the 2019 Permit, we propose moving the mapping requirements out of (S5.C.3) IDDE program to its own Special Condition (S5.C.X), to align with the Phase I permit structure.

Table 1: Summary table of municipal stormwater mapping requirements

2013-2019 & Proposed 2019-2024 Phase I and WWA Phase II mapping features							
Common elements							
Known MS4 outfalls (discharges to surface receiving waters or waterbody)							
Known discharge points (DP) (discharges to be a constructed by the second	to facilities/BMPs designed to infiltrate)						
Receiving waters ('other than groundwate	er')						
Stormwater treatment and flow control BMI	Ps/facilities owned or operated by the Permittee						
Permanent stormwater facilities owned a	nd operated by the Permittee						
MS4 geographic areas that do not dischar	ge to surface waters						
• Tributary Conveyances (& attributes) to o	utfalls & DP with >24" diameter, or an equivalent cross-sectional area for non-						
pipe							
 Attributes include: 							
 Tributary conveyance type, ma 	aterial, and size where known						
 Associated drainage areas 							
Land use							
Connections:							
o Between Connections from Permittee's MS4s and to other municipalities or public entities stormwater sewer systems.							
 All connections to the MS4 authorized after 2/16/07 							
Phase I Only							
Connections:							
 <u>>8</u>" diameter connections to tributary conveyances 							
o Between stormwater treatment and flow control BMPs and tributary conveyances, including emergency overflows							
Phase I required format: electronic, with fully described mapping standards	WWA PH II <u>required preferred</u> format: electronic, with fully described mapping standards.						

III. Permit mapping terms and definitions - with guidance

This section pertains strictly to terms and definitions used in the Permit's mapping requirements section. See Permit for any other relevant definition. The *Additional Guidance* is largely taken from past Fact sheets and Response to Comments documents associated with the Permits.

Discharge point (DP) means the location where a discharge leaves the Permittee's MS4 through the Permittee's MS4 facilities/BMPs designed to infiltrate.

Additional Guidance

- Permittees are required to map all "known" DPs, which includes those found during field reconnaissance, permitting, etc. As a Permittee discovers or permits a DP that is not in their mapping system, the Permittee should follow an established protocol to update the map to include this feature.
- This definition refers specifically to MS4 facilities/BMPs designed to infiltrate that are owned or operated by the Permittee.
- Locations that inadvertently infiltrate are not included in this definition.
- In locations where DPs overlap with other features that are required to be mapped (such as permanent stormwater facilities) both features should be mapped and distinguishable as permit requirements, such as inspection and maintenance, relate to the features differently.

Conveyance system means that portion of the municipal separate storm sewer system designed or used for conveying stormwater.

Additional Guidance

• This definition is provided to distinguish the parts of the system that are used for the transportation of stormwater from all other parts.

Municipal separate storm sewer system means a conveyance, or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(i)) Owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State Law) having jurisdiction over disposal of wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the State.

(ii) Designed or used for collecting or conveying stormwater.

(iii)Which is not a combined sewer.

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(v) Which is defined as "large" or "medium" or "small" or otherwise designated by Ecology pursuant to 40 CFR 122.26.

Outfall means a point source as defined by 40 CFR 122.2 at the point where a discharge leaves the Permittee's MS4 and enters a <u>surface</u> receiving waterbody or <u>surface receiving waters</u>. Outfall does not include pipes, tunnels, or other conveyances which connect segments of the same stream or other surface waters and are used to convey primarily surface waters (i.e., culverts).

Additional Guidance

- Permittees are required to map all "known" outfalls, which includes those found during field reconnaissance, permitting, etc. As a Permittee discovers or permits an outfall that is not in their mapping system, the Permittee should follow an established protocol to update the map to include this feature. Further, as outfall records are added or updated, include outfall size and material as associated information.
- Definition clearly refers to a stormwater discharge to a SURFACE receiving water and does not include discharges to ground.
- Map MS4 outfalls at locations where discharges leave the MS4 and enters a private stormwater system, or other conveyance system or pathway, when it is known that discharge will enter a surface receiving water.
- Outfalls are not intended to connect the same stream segment or conveyance system under roads or driveways.

Permanent stormwater facilities are structures or devices designed or used to control stormwater flows, or remove pollutants from stormwater, or both.

Additional Guidance

- This definition is provided to return to language that was included in the 2007 Permits. It calls for the mapping of structural stormwater BMPs or devices owned and operated by the Permittee whether or not these facilities meet, or help to meet, the minimum requirements included in the Permits.
- This term refers to devices or structural stormwater BMPs constructed as retrofit projects, or prior to permit requirements.

Receiving waterbody or receiving waters means naturally and/or reconstructed naturally occurring surface water bodies, such as creeks, streams, rivers, lakes, wetlands, estuaries, and marine waters, or ground water, to which a MS4 discharges.

Additional Guidance

- Receiving waters is intended as a sub-set of 'waters of the state.'
- Federal regulations require the mapping of receiving waters by the permittee.

Tributary conveyance means pipes, ditches, catch basins, and inlets owned or operated by the Permittee and designed or used for collecting and conveying stormwater.

Commented [TC1]: Referring to this scenario as an *outfall* corrupts the existing permit's definition of *outfall* (a term defined through a settlement agreement during the last permit appeal) and introduces confusion as to what is considered a *connection* as described in this Guidance document.

In addition, once a discharge leaves the MS4 it often may not be possible to know its ultimate discharge destination (particularly if it travels through multiple ownerships and is an underground closed system). If an ultimate discharge destination can be determined, permittees would need to monitor as to whether a stormwater system discharged into has been modified effecting its discharge destination. In recognition of this, we feel it's appropriate to limit permittees' mapping requirements to areas where permittees own or operate they MS4.

Additional Guidance

- Tributary conveyance refers to the MS4 conveyance system and not the natural or reconstructed naturally occurring stream system.
- Permittees are required to map the tributary conveyance to an outfall or DP with \geq 24" diameter
- Permittees must also collect attributes of the tributary conveyance system, which include:
 - o Tributary conveyance type (e.g., ditch, pipe, catch basins), material (e.g., metal), and size where known (e.g., 24")
 - o Associated drainage areas –delineate the area of land that contributes to the tributary conveyance system
 - Land use e.g., Industrial, commercial, residential, etc.

Stormwater Treatment and Flow Control BMPs/Facilities means detention facilities, treatment BMPs/facilities, bioretention, vegetated roofs, and permeable pavements that help meet Appendix 1 Minimum Requirements #6 (treatment), #7 (flow control), or both.

NOTE TO READER: the proposed mapping language now relies on the proposed term "permanent stormwater facilities" to capture Stormwater Treatment and Flow control facilities/BMPs – these types of facilities would only be required to be mapped as a permanent stormwater facility" which does not distinguish between a facility built as a retrofit (i.e. not necessarily to meet new or redevelopment standards) and a stormwater treatment and flow control BMP/facility (helps to meet MR# 6 or 7, or both). It may be helpful to make that distinction in your mapping system as the two may have different inspection and maintenance requirements.

Additional Guidance

- Stormwater treatment and flow control BMPs/facilities that help to meet Minimum Requirements #6, #7, or both are required to be mapped.
- If more than one BMP/facility is required to meet either of these minimum requirements, all must be mapped.
 - o Infiltration BMPs are included within treatment BMPs/facilities in the manual.
 - o Dispersion BMPs are included within detention facilities.
 - Temporary erosion and sediment control BMPs, and BMPs/facilities built exclusively to meet minimum requirement #5, are not included in this definition. Further, a County may choose to include retention of forested conditions within the term if they are used to help meet minimum requirements #6 or #7.
- Permittees are not required to map stormwater facilities regulated by the Permittee, which are not owned or operated by the Permittee. While Permittees are not required to map private stormwater facilities, they must inspect private facilities that control stormwater runoff from new development and redevelopment sites –it may be useful to map those facilities that require inspection.

Commented [TC2]: Land use types as defined in the permit or the municipalities' code?

Note to reader:

<u>Underground Injection Control (UIC) Program</u> - The terms "outfall" and "discharge point" **do not** change how UIC wells are regulated or managed. The Municipal Stormwater Permits categorically exclude discharges to ground water through UIC wells (Special Condition S2.A.1; language provided above). Wells regulated through the UIC program are not required to be mapped under the Municipal Stormwater Permit, as the UIC program rules apply. However, it may be useful to include UICs on your map.

UIC wells are manmade structures used to discharge fluids into the subsurface. Examples are drywells, infiltration trenches with perforated pipe, and any structure deeper than the widest surface dimension. The majority of UIC wells in Washington are used to manage stormwater (i.e., drywells) and sanitary waste (large on-site systems), return water to the ground, and help clean up contaminated sites. UIC wells are regulated under the UIC Program (Ch. 173-218 WAC).

UIC Requirements for municipalities with national pollutant discharge elimination system (NPDES) permits¹

The Municipalities that are under a NPDES stormwater permit may also have stormwater discharges to UIC wells. The Stormwater Management Program required by the NPDES stormwater permit includes best management practices that also may be applied to stormwater discharges to UIC wells. To avoid duplication, municipalities that are under an NPDES stormwater permit may choose to meet UIC program requirements by applying their Stormwater Management Program to areas served by UIC wells. See Chapter 173-218-090(1) WAC.

IV. More guidance on features required to be mapped

The following features are not specifically defined, but are required to be mapped. Here is some guidance to help support the mapping effort:

• MS4 Geographic areas that do not discharge to surface waters

The requirement to map areas that do not discharge to surface waters calls for mapping geographic areas such as city blocks, parts of sub-basins, etc., that do not drain to surface waters, and instead drain to the ground. This provision does not require mapping individual drainage systems that discharge to ground.

Connections

Connection refers to any discrete point where stormwater enters or leaves the MS4 - such as from ditches or pipes. This term does not include sheet flow, or roof drains.

This term is not defined in the Permits. The Response to Comments for the 2007, 2013 Permits, and 2014 Permit modification, all include the above definition.

Specific connection points to the MS4 are called out to be mapped (see above). Knowing where stormwater discharges leave or enter your MS4 system assists with notifying adjacent municipalities/entities that -a hazardous spill has occurred, or to better trace illicit discharges, or to understand where stormwater impacts may be occurring.

V. Not required, but recommended features to map

The requirements for mapping are limited to the minimum features necessary to implement the permits. However, Ecology recommends that Permittees map additional features so that knowledge of the stormwater system is relatively complete. Consider mapping the following additional features, although this universe can be easily expanded based on local needs:

- UIC facilities
- Tributary conveyance to outfalls or discharge points with a smaller diameter (or equivalent cross-section) than 24 inches
- Older or retrofit permanent stormwater BMPs, otherwise not required to be mapped
- Land use
- critical habitats and waterbodies with listed salmon species

VI. MS4 mapping scenarios

The following scenarios are provided to illustrate terms and definitions of stormwater features in the context of a typical MS4, as well as which of these features ought to be mapped by the Permittee.

Figure 1. Simplified overview of the selected terms used to describe the Municipal Storm Sewer System (MS4) (e.g., a connection, a discharge point and an outfall). Permittees are required to map all known MS4 outfalls and discharge points, and "all connections to the MS4 authorized or allowed by the Permittee after February 16, 2007." This includes connections from private systems to the MS4 authorized or allowed after February 16, 2007.

Figure 2. Single jurisdiction's MS4 discharges to a surface receiving waters. This example includes a UIC facility with an emergency overflow to the MS4.

In Figure 2, the Permittee does not need to map the open drainage ditch as a Discharge Point, although mapping the ditch as a line segment may be of use to the Permittee. The point where the runoff leaves the ditch and discharges to the surface receiving water is mapped as an outfall. The UIC well is regulated through its own program and is not required to be mapped per the Phase I or Phase II Permit requirements.

*Regulated through the Underground Injection Control (UIC) Program. UIC facilities are excluded from the Municipal Permit, see S2.A.1.

Although not required, a permittee may decide to map UIC facilities for a comprehensive understanding of municipal drainage.

UIC Program additional info:

http://www.ecy.wa.gov/programs/wq/grndwtr/uic/index.html

Figure 3. Example of the Department of Transportation (WSDOT) MS4 discharging to a City's MS4

In Figure 3, the City would map the three connection points where WSDOT's catch basins direct runoff to a city's MS4, and the private storm pipe connection is authorized by the Permittee after February 16, 2007 (or after August 1, 2013 for new permittees in the 2013 Permit). The city would map the BMP that was designed to infiltrate as a discharge point (and as a permanent stormwater facility, or both). The city would map the overflow pipe that discharges to a surface receiving waters as an outfall.

Commented [TC3]: Referring to the Green Square in this scenario as an *outfall* corrupts the existing permit's definition of *outfall* (a term defined through a settlement agreement during the last permit appeal) and introduces confusion as to what is considered a *connection* as described in this Guidance document. Both should be referred to as *connection points*.

Figure 4. Example of two MS4s discharging to a private storm system with an MS4-private_outfall.

In Figure 4, City 'A' should map the Connection Point where its MS4 discharges to City 'B's open drainage ditch. City B would map the location where the drainage ditch (part of the MS4) discharges to the private storm system as an outfallconnection point toor regardless of this is because if City B knows that the MS4-discharges ultimately flows to a surface receiving water after it leaves its system. The private infrastructure would not be required to be mapped per the Permit, although this may be helpful for a permittee's program. The UIC well must follow UIC Program rules and is not required to be mapped per the Phase I or II Permit requirements.

Figure 5. Examples of several types of stormwater BMPs near and within the MS4 system.

In Figure 5, the permeable pavement, which has been designed to infiltrate stormwater runoff, would be mapped as a discharge point. The bioretention facility located on <u>private</u> property would not be mapped as a discharge point or an outfall because it is not part of the permittee's MS4. However, if either the bioretention facility, or the permeable pavement were constructed to help meet Appendix 1 Minimum Requirements #6, #7, or both, then these facilities would be considered stormwater treatment/flow control BMPs/facilities and the public facility (i.e. permeable pavement in this case) would be mapped as a permanent stormwater facility. The point where there is a discharge from the MS4 to receiving waters would be mapped as an outfall.

Commented [TC4]: As explained in a previous comment above, referring to the Green Square in this scenario as an *outfall* corrupts the existing permit's definition of *outfall* (a term defined through a settlement agreement during the last permit appeal) and introduces confusion as to what's considered a *connection* as described in this Guidance document. Both should be referred to as *connection points*.

Figure 7. Municipal system to private stormwater system.

In this scenario, the City maps the location where discharge leaves the MS4 and enters the private stormwater system as an outfall<u>connection point</u>because the City has knowledge the discharge will enter a surface receiving water.

Figure 8. In this scenario, the City maps the location where discharge leaves the MS4 as an outfall<u>connection point</u>-because the City has knowledge the discharge will enter a surface receiving water.

Commented [TC5]: As explained in a previous comment above, referring to the Green Square in this scenario as an *outfall* corrupts the existing permit's definition of *outfall* (a term defined through a settlement agreement during the last permit appeal) and introduces confusion as to what's considered a *connection* as described in this Guidance document. Both should be referred to as *connection points*.

Figure 10. Mapping MS4 outfall locations

In this scenario, three MS4 outfalls are mapped within this commingled stream and MS4 ditched system.

Figure 11. 'Is it a discharge point, a UIC or an outfall?' scenario.

In this scenario, the perforated pipe represents an infiltration trench, which meets the definition of a UIC. As such, the Permittee is not required to map this UIC. However, as aforementioned, the Permittee may find it useful to map this UIC from a system maintenance standpoint. Hypothetically, if this structure did not meet the definition of a UIC, but was designed to infiltrate stormwater, it should be mapped as a discharge point.

S8. MONITORING AND ASSESSMENT

A. All Permittees including Secondary Permittees shall provide, in each annual report, a summary description of the findings of any stormwater monitoring or stormwaterrelated studies conducted by the Permittee during the reporting period. If other stormwater monitoring or stormwater-related studies were conducted on behalf of the Permittee during the reporting period, or if stormwater related investigations conducted by other entities were reported to the Permittee during the reporting period, a brief description of the type of information gathered or received and its relevance to the Permittee's SWMP shall be included in the annual report.

Permittees are not required to provide descriptions of:

- 1. Any monitoring, studies, or analyses conducted as part of the regional stormwater monitoring program (Stormwater Action Monitoring, or SAM).
- 2. Any monitoring that triggers S4.F and is reported in accordance with that section of this permit,
- Any monitoring, studies, or analyses conducted for the behavior change program per section S5.C.1.b,
- 3.4. Any monitoring for IDDE activities per section S5.C.8,
- 4.5. Any monitoring conducted for TMDLs listed in S7 and Appendix 2, or
- 5.6. Independent mMonitoring conducted by the Permittee or its agent in accordance with requirements in S8.B.2 or 3 or S8.C.3 or 4 below.

Permittees' reporting of these fivesix categories of monitoring activities must follow the requirements specified in those sections. A summary of these monitoring activities does not need to be included in this annual report submittal.

Note to reviewers: Ecology reviewed the Phase I and Phase II permittees' S8.A annual report submittals for the past three years and found that many permittees are reporting on TMDL monitoring, submitting data tables, or referring to their SWMPs. Ecology wants this S8.A reporting to be meaningful, and therefore proposes to target the summary requested in this submittal to unexpected or other findings reported to the permittees. Do stakeholders agree with this narrowed focus? Do you propose another approach?

B. Regional status and trends monitoring.

1. Each Permittee that chose S8.B Status and Trends Monitoring Option #1 in the Phase I Municipal Stormwater Permit August 1, 2013 - July 31, 2018 (extended to July 31, 2019) shall pay into the collective fund to implement regional small streams and marine nearshore status and trends monitoring in Puget Sound. The Page 1 of 8

Released for informal draft public comment in fall 2017

Commented [TC1]: We feel it's inappropriate to require permittees to report on investigations that weren't sponsored by the permittee given that the permittee may likely have no bearing on the study's design, standard operating procedures, quality assurance, and quality controls, etc.

Commented [TC2]: Until there is a deliberate and organized effort to sift through the learnings gleaned annual report submittals and make them available in a readily consumable way, this reporting requirement will fall short in being meaninaful to many.

Furthermore, defining what's meaningful often lies in the eyes of the beholder. Does *meaningful* require that certain standard operating practices and protocols were followed for credibility? How is the stormwater relevancy nexus determined? It's just as meaningful to communicated findings that were unexpected as those that were expected.

Commented [TC3]: A significant limitation of the RSMP's probabilistic status & trends approach is that it only informs whether trends are getting better or worse (and where). It falls short of providing insight into "the why" those trends are emerging. The "why" is critical to help inform the adaptive management feedback loop permittees need to help inform the evolution of our stormwater management programs (and ratepayer who want to understand the value of their stormwater fee investments).

A stronger "equity case" could be made to continue MS4 Permittee funding support by bringing in other players to support funding of the probabilistic status & trends element of the RSMP. At a minimum, this would involve pulling in funding from various other types of water quality permittees (see https://ecology.wa.gov/Water-Shorelines/Water-quality/Water-quality-permits/Water-Quality-general-permits). One could also make the case to require participation from air quality permittees would also be appropriate given the atmospheric deposition contributions to pollutants in stormwater runoff.

Another path to consider is to have the RSMP effort evaluate the large long term data sets that have already been collected over the years by Ecology's Environmental Assessment Program and municipalizes to evaluate status and trends.

Proposed 2019-2024 Phase I MS4 permit language for S8. Monitoring and Assessment payments are due on or before December 1, 2019 and the amounts are listed in *(new)* Appendix XX.

Released for informal draft public comment in fall 2017

Note to reviewers: The annual payments in the prior permit were established to cover 1/4 of the five-year budget for receiving water monitoring. Ecology proposes that the annual payments beginning in 2019 be established to cover 1/5 of the proposed budget. The allocated annual per capita cost for S8.B monitoring would therefore be reduced from \$0.2442 to \$0.1954. OFM data for 2017 will be used for the calculations in the formal draft permit (the amounts provided for S8.B-C annual payments in the draft new Appendix XX use 2016 data). Continuing annual contributions rather than skipping a year will provide continuity for monitoring projects. The same approach is proposed for Western WA Phase II permittees. Do stakeholders agree with this approach, and will it work for permittees?

- 2. No later than December 1, 2019, King, Pierce, and Snohomish Counties, the Cities of Seattle and Tacoma, and the Ports of Seattle and Tacoma shall notify Ecology in writing which of the following two options for status and trends monitoring the Permittee chooses to carry out during this permit cycle. Either option will fully satisfy the Permittee's obligations under this section (S8.B.2). Each Permittee shall select a single option for the duration of this permit.
 - a. Puget Sound regional status and trends monitoring: Each Permittee that chooses this option shall pay into a collective fund to implement regional small streams and marine nearshore status and trends monitoring in Puget Sound. The payments into the collective fund are due to Ecology annually beginning August 15, 2020 and the amounts are listed in (*new*) Appendix XX.

Or

Note to reviewers: The option provided in the 2013-2018 permit for permittees to conduct individual receiving water monitoring did not produce the data Ecology hoped would meaningfully contribute to the regional program, and threatened its integrity. Ecology has considered not including any opt-out option at all in the 2019-2024 permit.

The Stormwater Work Group (SWG, the stakeholder committee that selects all SAM projects) recommended in June 2016:

"It is important to maintain the integrity of the regional status and trends monitoring program. This program needs to be fully funded to ensure that we can detect regional trends" ... and ...

"The permit needs to provide a strong, but not exclusive, incentive for permittees to participate in the pay-in approach as the primary means of funding the permitdriven regional status and trends monitoring program in Puget Sound receiving waters."

What do stakeholders think of the approach proposed proposed below? Do you have a recommendation for another approach?

Released for informal draft public comment in fall 2017

Page 3 of 8

Commented [TC4]: With the region's population growth, the total funds generated over that 5-year cycle will increase over the current permit. However, experiences from the current permit suggest that increases in funding aren't needed and perhaps should even be reduced. This is the case for the effective studies where it was difficult to identify enough quality studies. Source identification represents another area where difficulties in identifying meaningful ways to invest funds emerged. It has also been suggested that cost-reduction strategies for status and trends can be realized by adjusting to the sampling frequencies without compromising the objectives. Resulting savings and efficiencies could reduce MS4 permittee funding obligation or be utilized to support local monitoring and data evaluation efforts. The permit could specify criteria that local efforts need to meet in order to be eligible to participate in a local option (even possibly creating a pointweighted approach to determine the level of credit eligibility)

Commented [TC5]: The S8 investments have failed to provide a feedback loop to gage the effectiveness of our stormwater management programs, codes, policies, and capital facilities investments. Our local regional efforts meet these needs, functioning at a scale and resolution that benefits from the of integrating status & trends, source i.d., and program effectiveness evaluations. (see: http://waecy.maps.arcgis.com/apps/Cascade/index.ht

ml?appid=5c5ce19bb2e74b25b12a447f9945655b and https://fortress.wa.gov/ecy/publications/SummaryPages/1 703001.html)

The Thurston County's long-term monitoring program, referenced via the web links above, refers to a formal partnership between us and the cities of Lacey, Olympia, and Tumwater in place since the early 90s with the mission to: Assess the health of regional water resources to inform the development of programs, policies, and capital facility plans to protect those water resources for beneficial uses in perpetuity.

Unfortunately, tough choices had to be made by our Partnership as insufficient funding existed to fully fund these efforts and meet S8 obligations. Funding for the local monitoring was slashed by 44 percent. Our Partnership's ability to use locally collect data to inform local programs, policies, and capital facility plans has been compromised. The success story of this partnership as well the threats to its integrity was shared at MuniCon2017 (see http://www.wastormwatercenter.org/files/library/93pmlsc haffnermunicon2017-final.pdf)

We would like the S8 permit language to provide a pathway to support continued funding of these valued local monitoring regional programs.

- b. Stormwater discharge monitoring: Each Permittee that chooses not to participate in the regional status and trends monitoring shall conduct stormwater discharge monitoring in accordance with Appendix 9 and an Ecology-approved QAPP as follows:
 - Cities and counties shall monitor five independent discharge locations; ports shall monitor two independent discharge locations. Permittees are encouraged to continue this monitoring at locations monitored under S8.D of the Phase I Municipal Stormwater Permit February 16, 2007 – February 15, 2012.
 - ii. No later than February 1, 2020 each Permittee shall submit to Ecology a draft stormwater discharge monitoring QAPP for review and approval. The QAPP shall be prepared in accordance with Ecology publication 10-10-75 "Quality Assurance Project Plan Guidance: Special Condition S8.D: Phase I Municipal Stormwater Permit." If Ecology does not request changes within 90 days, the draft QAPP is considered approved. The final QAPP shall be submitted to Ecology as soon as possible following finalization, and before August 15, 2020.
 - iii. Flow monitoring at new discharge monitoring locations shall begin no later than October 1, 2020. Stormwater discharge monitoring shall be fully implemented no later than October 1, 2020 at existing discharge monitoring locations and October 1, 2021 at new discharge monitoring locations.

Note to reviewers: Ecology is proposing to update Appendix 9 with changes including:

- Reduce antecedent dry period from 24 to 8 hours
- Update laboratory methods as appropriate
- More clearly define sediment sampling as in-system solids sampling via sediment trap
- Add total PCBs to the runoff characterization list (using 1668C)
- Add guidance for interpreting non-detects
- Add particle size distribution
- Add or remove other parameters as more information comes in from SAM receiving water studies

Are these and other changes needed and/or appropriate for this appendix?

- iv. Data and analyses shall be reported annually in accordance with the Ecology-approved QAPPs.
- 3. Clark County shall:
 - a. Conduct regional small urban streams monitoring in the Lower Columbia River Basin.

Released for informal draft public comment in fall 2017

Note to reviewers: During the 2013-2018 permit, Clark County, seven Phase II permittees, and other stakeholders worked on a study design and implementation plan for this monitoring. The Lower Columbia Habitat Status and Trends Monitoring (LC HSTM) QAPP Template is the outcome of that effort. Clark County will conduct the monitoring and the Phase II permittees will contribute to this monitoring in the same manner as Puget Sound permittees contribute to SAM (payments to Ecology kept in an account –separate from the Puget Sound fund– and Ecology then enters into a contract with Clark County). Do stakeholders agree with this approach, and will it work for the LC permittees?

i. Submit a completed "Lower Columbia Habitat Status and Trends Monitoring (LC HSTM) Urban Streams QAPP Template" to Ecology before November 1, 2019. If Ecology does not request changes within 90 days, the QAPP is considered approved. The final QAPP shall be submitted to Ecology as soon as possible following finalization, and before February 28, 2020. The completed QAPP shall include all of the specifications and deadlines in the "LC HSTM Urban Streams QAPP Template."

Note to reviewers: The final draft "LC HSTM Urban Streams QAPP Template" is expected to be available for review in early 2018. The study design includes a base set of non-negotiable parameters and an extended list of additional parameters yet to be prioritized. Ecology envisions that Clark County and the Phase II permittees will set these priorities as part of completing the QAPP template or as an early reporting requirement in implementing the final QAPP. Do stakeholders agree with this approach, and will it work for the LC permittees?

- ii. Report data and analyses annually in accordance with the approved QAPP.
- C. Stormwater management program effectiveness and source identification studies.

Note to reviewers: During the 2013-2018 permit, the intent and purpose of S8.D Source Identification and Diagnostic Monitoring evolved from a Source Identification Information Repository to a focus on analyzing information from and supporting permittees' IDDE and source control programs. The SWG recommended that a small portion of the S8.D funds continue to support analysis of IDDE incident tracking data and that the remaining funds be rolled into the effectiveness study component. Ecology is proposing to eliminate the third account and to continue to fund both effectiveness and source identification studies from the same account. SWG will continue to select the studies. Do stakeholders agree with this approach, and will it work for permittees?

Released for informal draft public comment in fall 2017

Page 5 of 8

Commented [TC6]: We support eliminating the S8.D account, but with a twist to what is proposed.

Locally, Thurston County and its partners identified a need to secure more funding to support development and deployment of a pollution identification and correction program (PIC). Rather than rolling the remaining S8.D funds into the effectiveness studies account (which already appears to be excessively resourced relative to the capacity to utilize those funds effectively), we recommend that permittees have the option to redirect these contributions to allow permittees to support their local pollution identification and correction efforts.

Similarly, we recommend that permittees also have the option to redirect at least a portion of their effectiveness contributions to support data collection and analyses to support the development and effectiveness evaluation of their local stormwater management-related programs.

The option to redirect at least a portion of a permittee's contribution can help support the new proposed 2019 permit obligations which calls on permittees to use local data to: 1) identifying priority target audiences for their E&O programs, 2) identify high risk businesses to target Source Control Program efforts, and 3) inform the direction of Long term MS4 planning.

The permit could include the criteria that permittee's local efforts need to meet in order to be eligible to participate in such a local option (even possibly creating a point-weighted approach to determine the level of reward/credit eligibility).

1. Each permittee shall submit records of SWMP activities tracked and/or maintained in accordance with S5 and/or S9 in response to requests for information associated with effectiveness and source identification studies under active SAM contracts.

Note to reviewers: A small number of SAM studies are designed to answer questions with data directly provided by permittees. During the 2013-2018 there were two SAM effectiveness studies that required permittees' records. The projects ended up working with very limited data sets due to lack of permittee-provided data. SAM's future requests for information will be rare and targeted. The value of the study findings will only be as good as the data provided. Ecology wants the SAM studies to be as robust as possible. This does not require permittees to provide data to SAM project proponents; it is only for SWG-approved studies under contract with Ecology. Do stakeholders agree with this approach, and will it help permittees provide the necessary data?

 Each Permittee that chose S8.C Effectiveness Studies Option #1 or Option #3 in in the Phase I Municipal Stormwater Permit August 1, 2013 – July 31, 2018 (extended to July 31, 2019) shall pay into the collective fund to implement effectiveness studies. The payments are due before December 1, 2019 and the amounts are listed in (*new*) Appendix XX.

Note to reviewers: See the note on S8.B.1 above and the new Appendix provided for review. These amounts are all the less than the S8.C amounts in the prior permit.

- 3. No later than December 1, 2019, Clark, King, Pierce, and Snohomish Counties, the Cities of Seattle and Tacoma, and the Ports of Seattle and Tacoma shall notify Ecology in writing which of the following three options for effectiveness studies the Permittee chooses to carry out during this permit cycle. Any one of the three options will fully satisfy the Permittee's obligations under this section (S8.C). Each Permittee shall select a single option for the duration of this permit term.
 - a. Effectiveness Studies Option #1: Each Permittee that chooses this option shall pay into a collective fund to implement SAM effectiveness studies. The payments into the collective fund are due to Ecology annually beginning August 15, 2020 and the amounts are listed in *(new)* Appendix XX.

Note to reviewers: See the notes above for S8.B.1 and S8.C. The allocated annual per capita cost for S8.C studies is thereby reduced from \$0.4068 to \$0.3556. OFM data for 2017 will be used for the calculations in the formal draft permit (the amounts in the new Appendix XX use 2016 data). Do stakeholders agree with this approach, and will it work for permittees?

Or

Released for informal draft public comment in fall 2017

Commented [TC7]: The observed participation rates may have been a function of the low value/utility (i.e., meaningfulness) that many permittees place on those particular studies. This in turn may be an indicator of the engagement challenges involved in the regional prioritization and selection process to identified high value studies, particularly for smaller jurisdictions with less staff resources available to participate is the processes as they were carried out (essentially creating environmental justice inequities).

The expectation that all regional effectiveness studies will be meaningful/relevant to all (or even the majority) of permittees is likely unrealistic given the vast differences among permittees (e.g., city/county, primarily closed vs. open MS4 systems, highly urbanize vs. suburban, till vs. outwash, etc.). Redesigning the study selection process that doesn't put these real world differences in competition with one another would help make participation in the regional effort more relevant to more permittees.

Commented [TC8]: Refer to our comments regarding per capita costs.

Page 6 of 8

 Effectiveness Studies Option #2: Each Permittee that chooses not to participate in the effectiveness studies component of the regional monitoring program/SAM shall conduct stormwater discharge monitoring in accordance with Appendix 9 and the following:

Note to reviewers: See the note on S8.B.2.b above regarding proposed changes to Appendix 9.

- Each city and county Permittee shall conduct stormwater discharge monitoring at five locations. Permittees are encouraged to continue stormwater monitoring at locations monitored under S8.D of the Phase I Municipal Stormwater Permit February 16, 2007 – February 15, 2012. Permittees who choose this option and also choose Stormwater discharge monitoring per S8.B.2.b shall conduct this monitoring at a total of ten locations.
- ii. Each port Permittee shall conduct stormwater discharge monitoring at two locations representing different pollution-generating activities or land uses. Permittees are encouraged to continue stormwater monitoring at locations monitored under S8.D of the Phase I Municipal Stormwater Permit February 16, 2007 – February 15, 2012. Permittees who choose this option and also choose stormwater discharge monitoring per S8.B.2.b shall conduct this monitoring at a total of four locations.
- iii. No later than February 2, 2020 each Permittee shall submit to Ecology a draft updated stormwater discharge monitoring QAPP for review and approval. The QAPP shall be prepared in accordance with Ecology publication 10-10-75 "Quality Assurance Project Plan Guidance: Special Condition S8.D: Phase I Municipal Stormwater Permit." If Ecology does not request changes within 90 days, the draft QAPP is considered approved. Final QAPPs shall be submitted to Ecology as soon as possible but no later than July 31, 2020.
- iv. Flow monitoring at new discharge monitoring locations shall begin no later than October 1, 2020. Stormwater discharge monitoring shall be fully implemented no later than October 1, 2020 at existing discharge monitoring locations and October 1, 2021 at new discharge monitoring locations. All monitoring shall be conducted in accordance with an Ecology-approved QAPP.

Or

c. Effectiveness Studies Option #3: Each Permittee that chooses this option shall both pay into a collective fund to implement regional effectiveness and source identification studies **AND** independently conduct an effectiveness study that

Released for informal draft public comment in fall 2017

Commented [TC9]: While the Option #2 pathway maybe be of value to a limited number of permittees (e.g., Superfund remediation receiving waters), it is too narrowly constrained as to constitute a relevant effectiveness investment option for most permittees (Particularly in light of the outfall effectiveness monitoring the required under the 2007 Phase I Permit as well as the runoff land use characterization research that has already been completed nationwide.).

is not expected to be undertaken as part of the regional monitoring program/SAM.

i. Payments into the collective fund are due to Ecology annually beginning August 15, 2020. The payment amounts are:

Permittee	Payment amount
Clark County	\$ 38,894
King County	\$ 43,725
Pierce County	\$ 69,744
Snohomish County	\$ 60,274
Port of Seattle	\$ 3,233
Port of Tacoma	\$ 3,233
City of Seattle	\$122,113
City of Tacoma	\$ 36,645

- ii. Conduct the independent effectiveness study in accordance with the requirements below:
 - (1) No later than February 2, 2020 submit to Ecology, for review and approval, a detailed proposal describing: the purpose, objectives, design, and methods of the independent effectiveness study; anticipated outcomes; expected modifications to the Permittee's stormwater management program; and relevance to other Permittees.
 - (2) Submit a draft QAPP to Ecology within 120 days of Ecology's approval of the detailed proposal. The QAPP shall be prepared in accordance with [QAPP templates under development, see note below]. The QAPP shall include reporting details including timely uploading of all relevant data to Ecology's EIM database and/or the International Stormwater BMP Database as appropriate, and sharing the findings with other Permittees. If Ecology does not request changes within 120 days of submittal, the QAPP is considered approved.

Note to readers: Three QAPP templates for structural, operational, and education/outreach BMP effectiveness studies were developed for Eastern WA during the 2014-2019 permit; they are being adapted for W WA.

- (3) Begin full implementation of the study no later than six months following Ecology's approval of the QAPP.
- (4) Describe interim results and status of the study implementation in annual reports throughout the duration of the study.

Commented [TC12]: Depending on the QAPP approval date, beginning full implementation later than six months may be appropriate for study's that are temporal or seasonal in nature.

Released for informal draft public comment in fall 2017

Commented [TC10]: How would a permittee know studies expected to be undertaken by SAM?

Commented [TC11]: Refer to our comments regarding per capita costs.

- (5) Report final results, including recommended future actions, to Ecology and on the Permittee's webpage no later than six months after completion of the study.
- (6) According to the schedule in the approved QAPP, produce a two page fact sheet for distribution among municipal stormwater permittees.

Note to reviewers: S8.D is removed from this informal draft permit. See notes on S8.C above. See proposed draft language for IDDE incident tracking and annual reporting, S5.C.8.g.

Released for informal draft public comment in fall 2017

Totals	4,836,236	\$ 907,827	\$ 1,715,858	\$ -	

Notes to reviewers:

This is a proposed new appendix with all Phase I and W WA Phase II permittees' annual SAM contributions listed. The appendix would be the same in both the Phase I and W WA Phase II permits.

- The table shows updated annual costs using the same per-capita cost allocation from the prior permit but spread over five years instead of four. Do stakeholders agree with this approach? Do you propose another approach?
 - a. With some exceptions listed below, the source for the population data is https://data.wa.gov/Demographics/2012-2014-Population/782x-jqab accessed on 9/20/16. Ecology plans to update these populations using the most current data for the formal draft permit.
 - Phase II County unincorporated area UGA populations for 2016 are from http://www.ofm.wa.gov/pop/smallarea/default.asp updated 9/21/16 and accessed on 10/5/16. Ecology plans to update these populations using the most current data for the formal draft permit.
 - c. Cowlitz County is not a Growth Management Act planning county their 2016 permit coverage area population was determined by subtracting populations of Longview and Kelso from OFM's "county parts of urban areas" estimate released on 9/21/16.
 - d. WSDOT's contributions to S8.B.2.a SAM and LC HSTM programs would be included in the table so that all permittees can get a sense of their relative contributions. Using the current population data, WSDOT would be expected to contribute \$24,322 to SAM receiving water monitoring and \$9,092 to LC HSTM urban streams monitoring.
- 2. Permittees/permitted areas that were new in the 2013-2018 permit (Snoqualmie, Lynden, and Birch Bay UGA) would not contribute to SAM until the second year of the 2019-2014 permit. Do stakeholders agree with this approach? Do you propose another approach?
- 3. Population estimates for the Ports of Tacoma and Seattle were made by increasing the figure used in the 2013-2018 permit and increasing it by 1.078 percent the cumulative population increase for all western Washington permittees. Do stakeholders agree with this approach? Do you propose another approach?
- 4. For S8.B, the total 5-year per capita SAM and LC HSTM allocations are the same but Phase II permittees' LC HSTM allocations would begin in the second year of the 2019-2024 permit and are spread over four years. Do stakeholders agree with this approach? Do you propose another approach?
