

## Edward Vaughn

A recent report has indicated a massive decline in necessary insect populations---bees, butterflies, etc. The cause is almost certainly the use of pesticides. And your response to the problem in Willapa Bay and Grays Harbor is to ... inject more chemicals, specifically Imidacloprid. Precisely how much poison can the earth's system support? AND, what will this poison do to other life forms in the area? Have you no other answer, none? Not very imaginative, folks. Try again!
