

Peri Hartman

There are natural predators of shrimp and their eggs. Among predator examples cited from some quick searches: jellyfish, herring, and even gray whales.

I believe that the state should require that a natural approach using predators should be used and that industry should completely exploit such an approach before asking to use neurotoxins.

To put more toxins in our environment, especially at the base of the food chain, couldn't be more risky.

Do not approve the use of Imidacloprid.
