If the reason the ghost shrimp are proliferating is due to radical disruption of the ecosystem, then address the health of the environment. Spraying with a neurotoxin pesticide with unknown risks to all creatures in the tide flats is not the solution. Human attempts to immediately fix problems that have been created over a long period of abuse may take time. A diverse, naturally functioning tidal zone would not have the problems that a huge monoculture oyster farming operation does. Look to the natural world to regain balance, do not continue to throw more gas on the fire !
