

Caitlin Morrison

I am an environmental epidemiologist. We do not want to spray these beds with imidacloprid. There is not enough data yet on the long term effects of use. There is not enough specificity yet in how they would spray (for example: only limit spraying to one section for the first ten years). We cannot afford to run experiments in our natural environment. We can not afford to put something in our water annually where we are not extremely confident in the outcomes, especially with neurotoxins.
