I'm a tax payer and boater that disagrees with the Puget Sound no discharge zone. Puget Sound has big tides and fast moving currents. This makes for a great mixing zone. All pleasure boats already have holding tanks for black water. One of the problems is the lack of pump out station. The pump stations that are in existence are poorly maintained. What would the cost to tax payers to improve the pump out stations? What would be the cost of installing grey water tanks and where would you put them on an existing boat. Room in the bilge will be a problem. What would the cost to the commercial fleet? The commercial fleet is already very competitive. This could take away jobs which would mean less tax money for the state. I vote NO for the no discharge zone. Thank you.
