

Kurt Wilson

We need to change our focus from forcing things like porous asphalt/concrete usage to functionally equivalent designs. This can include things like using a reservoir course with shallow perforated pipes under sidewalks and in the road where it makes sense to mimic what you are trying to accomplish.

Why not focus on mitigation of offsite problems where water quality and detention don't even exist and really get at the problem rather than focus on the 5% that can't even make a dent. Your own office admits you have done about all you can, but the office is empowered to keep dreaming up new unfunded mandates that don't accomplish what they should for the expenditure.

I am glad I get to make a record of this comment because mark my word, DOE will be responsible for forcing the use of these products on local government whereby the tax payers are strapped with a perpetual maintenance nightmare.
