

Kittitas County Noxious Weed Control Board

The addition of aminopyralid and topramezone to the NPDES permit is a positive modification that would aid in targeting certain invasive aquatic weeds selectively, minimizing the impact to non-targets. Providing the tools that effectively target invasive species with greater selectivity while still having a low toxicity and positive environmental profile is common sense. I encourage the Department to continue to use best available science (ever evolving) to make sound decisions in providing us with the best tools possible.
