

Below is a letter addressed to Director Bellon and Program Manager Heather Bartlett at the Department of Ecology, signed by more than 1,000 individuals, asking that the Department increase total dissolved gas standards in the Columbia and Snake Rivers to 125% in a single step, in time for the 2019 juvenile salmon out-migration that begins in early Spring.

If you have any questions about this, please contact: Joseph Bogaard, joseph@wildsalmon.org, 206-300-1003. Thank you.

February 28, 2019

Maia Bellon, Director
Heather Bartlett, Water Quality Program Manager
Washington State Department of Ecology
P.O. Box 47600
Olympia, WA 98504-7600

Re: Comments on Draft EIS for Short-term Modification of Total Dissolved Gas Standards for Federal Dams on the Lower Snake and Lower Columbia Rivers

Dear Director Bellon and Program Manager Bartlett:

Southern Resident orcas are one of the most endangered marine mammals in the world. The chinook salmon populations these whales once relied on, particularly those in the Columbia-Snake River Basin, are just a remnant of their former levels, leaving these whales with far less food to eat. Columbia and Snake river chinook were once the largest and most abundant salmon anywhere on the west coast, providing Southern Residents with a critical winter food source at a time when there are few other salmon available.

The decline of salmon across the Northwest is complex, but perhaps the most significant degradation of salmon habitat has been the damming of its rivers. Dams and their reservoirs slow adult and juvenile salmon migration, making them increasingly susceptible to predation and lethally warm water. Large reservoirs on the Columbia and Snake rivers make it difficult for young salmon to quickly and safely migrate to the ocean where they can mature into adults. A highly effective near-term step to alleviate at least part of this problem is to increase the amount of water spilled over the federal dams in the Columbia Basin. Decades of scientific research and observation has shown that spill is the safest way for juveniles to migrate past dams and reservoirs to the ocean and that higher levels of spill result in larger adult salmon returns in subsequent years. For over two decades, Washington's total dissolved gas (TDG) standards, which limit the amount of water that can be spilled, have been overly conservative and harmed salmon survival.

The best available science suggests that eliminating the 115% forebay TDG standard as you propose and immediately increasing the tailrace TDG standards to 125% will maximize the benefits of spill without negatively impacting other species or the environment. Spilling up to this level is estimated to result in hundreds of thousands more adult salmon, making spill one of the most effective near-term actions the state can take to provide more food for orcas. Your department has proposed increasing tailrace TDG standards to only 120% for this spring's out-migration. While this increase may provide very modest help to juvenile salmon en route to the ocean, there is no reason not to raise TDG standards to 125% immediately. The scientific evidence that this level of TDG, especially implemented flexibly as proposed, will not harm juvenile salmon or other aquatic life.

More than 20 years of empirical data about the effects of dissolved gas on salmon support this conclusion. This data warrants action now to raise TDG standards to 125%.

Southern resident orcas are starving to death and are unable to find enough food to survive and successfully raise new calves. This situation requires an emergency response. I strongly urge you to increase the state's TDG standards to 125% in time for the 2019 outmigration and for 2020 and 2021 as well.

Sincerely,

Protect every species...Everywhere!!!

This is so important to all Americans, not just those in the PNW. Keeping up the salmon fisheries helps the orcas, and fisherman, and even help to fertilize the forests far inland (who knew???). When the dams were built, the ecosystems were intact and we had no idea the widespread destruction that was possible from them. Now we know. Do what you can, Increase dam flow this year, and bring down some of those dams in the future! Thank you!!!

Let us not be responsible for the extinction of a species so dear to us

We have known about the decline in salmon population and how it would affect the local Orca population since the 1970s, and now we are at that critical moment that if we don't do something now, we will lose that population. The Orcas are part of the northwest and I believe should be saved at any cost. Once the dams are breached, there may be a human toll that needs to be addressed, but it is now or never for those Orcas.

Save our Salmon

Salmon is a keystone species in the Columbia River Basin. The result of its demise would be a tragedy for the Northwest and for many other species (at this date, particularly Orca, but with many other plants and animals also involved in the Basin). Restore NW rivers and make provision for the needed additional spill at dams.

				As a WA State resident, I ask the WA Dept of Ecology to improve its water quality rules in early 2019 to allow higher levels of spill for the sake of endangered salmon and starving orca. Governor Inslee needs to see strong public support for his leadership. We need to increase spill now – while we continue to make progress to remove four costly dams and restore a healthy lower Snake River and open up access to more than 5,000 miles of pristine, protected salmon habitat upstream.

Sandra	Ciske	WA	98116	
steve	simmons	OH	45434	
Diane	Straus	CA	94530	Orcas are a treasure and bring tourists to the state to see them. Food is life! Southern Resident orcas need many more chinook salmon in coastal water in order to survive and recover. Though a restored, freely flowing lower Snake River is the region's very best opportunity to get starving orca the salmon they need, interim steps must be taken immediately until that can be accomplished. Increased spill at the federal dams on the Snake and Columbia rivers is the most effective near-term option to increase salmon populations – and orca meals. We must increase spill NOW – while we continue to make progress to remove four costly dams and restore a healthy lower Snake River and open up access to more than 5,000 miles of pristine, protected salmon habitat upstream.

I am a fisheries biologist who has worked for the Alaska Department of Fish and Game and the Fisheries Department of the Puyallup Tribe of Indians. Chinook salmon systems cannot thrive in isolation facing the pressures of predators and commercial fishing, whether intentional or through bycatch. The benefits of taking the suggested actions will likely spread well beyond the Columbia River and the Southern Residents, who need relief so desperately.

Be bold and remove the 4 Lower Snake River Dams.

David	Guren	WA	98125

From 1956-1980 I was Quality Assur. Dir. for Col.River Pkrs. Assoc./Bumble Bee Seafoods in Astoria. This plant was closed down due to lack of SALMON return. The operations of the dams along the Snake R. system caused the last source of salmon to diminish greatly. Transportation downriver is no longer necessary and operations of the dams must be adjusted to favor the survival of the remaining salmon stocks to enable their recovery.

Claire Egtvedt WA 98275

				Action is needed now!
				While there are many long-term options to help salmon and orca recovery there are very few short term practical options that will stay the gap towards extinction before long-term actions mature enough to have benefit. Increasing spill over the dam is one of these critical and extremely important short term actions. Please increase spill and give time for the more longer-term actions to kick in.

Please excuse me if this is the second time signing. The issue is too important. Salmon are sacred. We must do all we can to protect them.

R3L

I am always astonished at the ease by which the human race acts to destroy its ecology and environment. All that I can say is go ahead. Destroy the salmon while destroying the waters. Lose the Orca, and totally dismember the natural evolutionary path of the planet Earth.

We live upstream and are directly affected by decisions related to anadromous fish made by Washington. Spill has been identified as the single most important action that will have immediate positive outcomes for Idaho's ESA listed Snake River salmon and steelhead. We strongly support TDG standards to be increased to 125%. Thank you. Jerry and Terry Myers

Dams are unnatural and too often detrimental to wildlife . It is because of people orcas are starving thus it is put to people to change that by increasing that dam spill. Animals suffer already from the actions of our own species and all that can be done to help them should be done..

I have commercial fished in Alaska for 9 years. One major difference between the rivers there and the rivers in Washington is that the rivers in Alaska are mostly undammed. Let's bring back the economy of salmon to Washington state. Healthy, resilient salmon runs support healthy, resilient communities. While we wait for the Snake River Dams to be breached, let's protect the last runs of real wild salmon by increasing spill rates over the dams when the smolt are coming down the river.

The recommendation this month by Canada's government to expand The Trans Mountain pipeline, in spite of the impact on the southern Orca population, is unbelievable. In a Seattle Times article on 2-22, we are informed that: "The project will likely harm endangered southern resident killer whales, increase greenhouse-gas emissions that worsen the impacts of climate warming, and could cause oil spills that would be damaging to the environment, the board found" The project would increase tanker traffic in the Salish Sea from about six tankers per year to more than 400. It's well proven that ship noise confuses the Orcas in their search for food. However, the more-than-700-mile-long pipeline should be approved by the government anyway, the board found, because it is in Canada's national interest. What about the Orca's interest, and their survival? Please take this step, which is something we can do NOW without huge expense and bureaucratic bickering.

The health now and even more so in the future is critical to all our waterways. I travel all of North and South America and what we still have and need to protect is so precious that we have do all we can to improve the quality of our Environment and our waterways and now we have the technology to make it happen. Stop the GREED conserve all we can by acting now!

We must increase "spill" to 125% Total Dissolved Gas Standard at the federal dams on the lower Snake and Columbia River dams starting now, in 2019. We must engage stakeholders for solutions involved with removing the four lower Snake River dams. Breaching the four lwr dams on the Snake reopens vast historic habitat for critical salmon runs. This needs to be happening as soon as this year.

Kathleen	Daviscourt	WA	98043

The current status of not one but three species, salmon, steelhead, and Orca's, should point to a red flag for the condition of river flows and tailrace TDG as they are needed for survival of these species. Do the right thing and increase the flows, raise the tailrace TDG.

Edward Vanover Guelph, Ontario, CA

The Columbia River system us the main arterial of the Pacific Northwest riparian system - it used to produce the most prolific runs in the world. Our orca are starving and uncreased spill is a small step towards allowing more Chinook to return and feed them. I believe that, ultimately, given the reduced need for emergency power, the increased rail transport and the fact that the dams are falling apart that they are long-past due being taken out. Increased spill is, literally, the least you should do. Your action is needed now.
