

Mark Booker

Using spill and River Dam spillways to move migrating fish downstream is short sighted for at least the following reasons: 1. The tremendous turbulence of the ninety foot spill down the spillway will damage any migrating fish very likely beyond survival. 2. The spillway volume of spill flow will certainly distract returning migrating fish likely causing the returning migrating fish to fail to return.

Both the above reasons along with many other reasons are counter to the goal of creating returning migrating fish.

The Business of Salmon Recovery is very different from the Business of recovering Salmon. The Business of Salmon Recovery will steal from our children's future all without benefit to migrating fish.

Mark, from the land of the Mighty Columbia!!
