

Christina Cunningham

The science needed to clarify and justify why water temperatures need to be regulated is there. You don't need to read a long list from me why it needs to be done to facilitate the survival of coho salmon. You're in a position of being able to put in place the environmentally responsible science-based actions that are so obviously needed. Make the right decisions to begin to mitigate human impact on this already compromised ecosystem. You have the power and the responsibility to act morally and ethically where others do not. Please.
