in time

Looking back at the crops grown in this valley such as sugar beets, potatoes, etc., there used to be fertilizer poured on those crops. There was not fertilizer management we have now. It was the "more is better theory." I am just wondering how that might have impacted what we have now
?????

Dairymen purchase land from other farmers and do reclaim the ground from those who have poured on the fertilizer in years previous.

Dairymen soil test twice a year which is more than most!

Our management practices are pretty efficient because we want to be economical!

Manure is a fertilizer and not waste!
