

## Javier Madrigal Jr.

PCBs are dangerous. Limiting PCB exposures for wildlife and humans is important to our health and our children's health because of risks that include birth defects and cancers.

A "water quality variance" will weaken water quality standards. This is terrible news for the Spokane River and our community, and a dangerous precedent for all waters around the state. Ecology, this is a bad idea, especially with Trump's EPA already working to roll back the state's water quality standards.
