I don't feel a general permit is the way to go. There are numerous different types of treatment, terrain, collection systems, etc.. A general permit requiring all discharges be held under the same restrictions and guidelines just would not work. I feel each individual permit should be assessed to determine what type of nutrient removal can be obtained. My plant was not built for any type of nutrient removal. I agree, nutrient removal should be required however, my plant will not meet nutrient requirements without a major upgrade to our process costing upwards of 20 million dollars. That wont happen in 5 years.
