August 8, 2019

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Dorothy wayne

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Sally McCarthy

Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Julia McLaughlin

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Nancy White

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

E Willey

Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Paul Brown

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

August 8, 2019

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Leta Collmer

Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Carol Haines

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Ann Dawson

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Sue Emrick

With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Mark Beringer

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Ricky Taylor

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Maxwell Trotter

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Liza Martin

Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Brian Gunn

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Thom Lufkin

Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Walter McGerry

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Mary Rance

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Jack Burke

Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Sammy Low

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Frank Jackson

With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first. Additionally, US Oil is contaminating our waters with copper and zinc, toxins known to kill salmon, a shared resource that is already facing dwindling population numbers. Ecology should implement numerical standards for these pollutants *now*, not after the permit has been issued.

The permit also does not evaluate the additional water pollution impacts of possible expanded operations at US Oil, which could occur during the 5-year period of this permit.

I urge the Department of Ecology not to renew the US Oil's NPDES water quality permit until you have done everything you can to assure the protection of our water and communities from these extremely dirty fuels.

Further, I urge Department of Ecology to make clear its role and intentions to comprehensively review additional water and air quality impacts resulting from any proposal to expand US Oil refining, storage, or transloading capacity. When US Oil begins expanding their facility, Ecology must re-evaluate their water quality impacts and re-issue this permit with more protective standards and restrictions.

Thank you for your work to protect Washington's communities and clean water.

Sincerely,

Ester Deel

Dear Department of Ecology,

I am deeply concerned about the renewal of the National Pollutant Discharge Elimination System water quality permit for the US Oil refinery on the Tacoma Tideflats and the limited protections it provides to Tacoma from ongoing water pollution, as well as future impacts from any proposed facility expansion.

US Oil currently accepts tar sands oil, a heavy oil that can sink and submerge when spilled and becomes nearly impossible to fully recover. With their purchase of US Oil in 2018, Par Pacific has made it clear that they plan to expand the facility, increasing shipping of crude oil by both rail and tanker. Any expansion of this facility would further expose Washington communities and the Salish Sea to a much greater risk of oil pollution.

The draft permit does not go far enough to ensure strong enforcement of toxic discharges from the facility, nor does it address possible changes in impacts that would arise from a facility expansion. Ecology is being too lenient by allowing US Oil to discharge contaminated stormwater without ensuring it has met water quality standards first.
