

**Rick Fuller**

Rick Fuller, 14514 Talmo Drive, Gig Harbor. My comment is dealing with the extent, I've heard comments by other people saying well gosh we've got this pollution in the ground and where exactly it is and I've seen diagrams on the board. I'm a chemist, I've served time with the City of Tacoma for 25+ years. I've driven around here, I've lived here, I understand, I've sampled this area extensively. I know PCE, TCE, I understand those chemicals, once they hit the ground water how fast they move. I have questions, I have questions that are asking some smart people in this room. My questions mainly go around this fact, "If the concentration is a million pounds, and if you take a million pounds and you multiply that by the area, you get a cubic feet and you divide it by a million pounds, you don't come up with anywhere near the 1000 ppm that they are listed up on. There's missing parts and in just the simple math for me, I'm missing a 90% is non-incorporated in what is presented to us. There's a big data gap someplace, so where is that data. That's what I'm asking. I do a mass balance with my calculator in my pocket using the information provided right here and it doesn't balance out. We're missing something and I think it's, if I could guess, I would say it's out in Commencement Bay already. The area in what they have not sampled and not, they just estimated and said it's out that way someplace. I'm done.

Thank you
