Comments:

WDOE commented that the pollution is limited (if not stable) to a specific location. Also, the concentration of 1,000,000 lbs of waste was released, best estimate. This mass balance does not add up - if calculated within the area outlined by WDOE, what measures are in place to check that the area studied is the entire amount released? How can we be sure ~~area~~ a much larger plume has already moved beyond the studied area?
