## **Mitigation plan goals and overarching principles**

Consider electric ferries. That will mitigate polluting the water and air, longer engine life with far fewer repairs, and has potential for lowering fare costs. Makes it a win all around and especially on those who need to use the ferries every day for work.

## **Disproportionately impacted communities**

Replacing our public busses and ferries meets the goals described here in improving air quality in lower income neighborhoods near congested roads and ports. Also reduces pollution in the water which is a win for marine life that many peoples depend on for income. It's a question of how many can be replaced to make the impact noticeable.
