

Erica Gomez

If this is implemented it should come with real-time air quality monitoring that is made publicly available. Stringent thresholds should be set, and there should be a push alerting system to warn people in or near affected areas that air quality is being impacted, as well as auto-shutdowns of the plant in the event that air quality exceeds that threshold or a sufficient rate change in the threshold. Vashon continues to deal with the downstream impacts of the ASARCO smelter. Let's not repeat past errors.
