

Teresa Orozco

As a resident of Spokane, I would choose the safest, fastest method of cleaning pollution in and around our water. I have a hard time trusting a company who caused the pollution to choose/present the most appropriate options. I don't think igniting/burning fossil fuels in Hillyard sounds like a good idea at all. One of the best assets our town has is our clean water underneath of us. As the "Department of Ecology" I trust preserving our towns' treasure is a priority for you and the Department. I noticed the statement that the "Dept. of Ecology doesn't fully support some of the conclusions in the RI/FS..." What is the department's preferred method and why? As a city lay-person I would suggest option D. I would also suggest asking experts not just people who live in Spokane. I'm not an expert in environmental sciences or ecology. Will this in any way come back to the tax payers and/or government spending? There are many sites in Washington needing urgent attention. It is possible this should not be priority one, though the proximity to my house leads me to FEEL differently.
