

Adam Jackson

What is the opinion of DOE on each of the options? Weighing the decision solely on costs over time, I would say Option B is the most efficient. However, if I understand correctly, it appears that the private entities (BNSF and Marathon Oil) are financially responsible for the site clean up. With this in mind, I would select whichever clean up option most effectively limits its impact to the progress of the NSC construction; in order to limit the public dollars expended on delays or changes to the NSC project.
