

KEN KOSCH

I read the options A,B.etc. The 14 year in option B is the least expensive and most cost effective. My question is why would it cost 5.5 million to force air and let nature take it course? How many people have their hands out to line their pockets with these government projects.

If there is a time crunch that prevents the construction of the freeway from continuing then why not dig up the 15 ft deep (9,150 square foot area) and burn it in a tumbler type device and return the soil.
