

Ivanna New-mtca

Why is Ecology looking to create a new SHA WARM tool? The purpose of the WARM is to prioritize Ecology's resources towards sites with the greatest potential to impact human health and the environment in an effort to affect change. Until MTCA is prepared to forego its current method of "cleanup when you are ready" in favor of a true priority-driven cleanup with potential true enforcement action for sites where documented impacts are happening, there is no purpose to having a ranking system. The resources we are looking to allocate should not be strictly people and time, but effort and remediation. Why rank something when we are not going to enforce a cleanup? MTCA has the potential written into it - and others have made a point to bringing this forward - for true enforcement capabilities; but at present the mindset is to not push the envelope, to allow people to cleanup a site when they are ready at a pace they are comfortable with, and if they don't want to then they don't have to. Ecology is not a corporation, it is a state agency; Ecology is not here to make people comfortable or to accommodate only those who are willing. Ecology's purpose, its client, is the State of Washington and Ecology is fighting for Washington's health. Change the mindset, change the rule, and then refine the process. Until we change the mindset we will continue to be stuck in the ever-growing backlog of more and more terrifyingly contaminated sites causing a greater and greater impact to human health and the environment in Washington State. Is this the legacy we will all leave behind or are we ready for a new tomorrow?
