

Pacific Merchant Shipping Association & Marine Exchange of Puget Sound

From my experience with legislators, few if any know in reasonable detail about the existing marine safety regime. Without some knowledge of the existing safety regime, they can't possibly know and understand what additional mitigation measures might be appropriate. They should also be educated on the principle of preemption.

Board of Pilotage Commissioners Annual Reports (includes assignment data and incidents)

It appears that you are going to look at worldwide ATB incidents/spills per the legislation so seems you should also consider looking at all incidents/spills around the world to compare and contrast the record in this region with that of other regions and the world in whole. You should be able to get worldwide oil spill data from the CG.

Here is a list of some of the documents you should review regarding existing maritime safety measures:

- USCG Port State Control Program -- <https://www.dco.uscg.mil/Our-Organization/Assistant-Commandant-for-Prevention-Policy-CG-5P/Inspections-Compliance-CG-5PC-/Commercial-Vessel-Compliance/Foreign-Offshore-Compliance-Division>
- Transport Canada Port State Control Program -- <https://www.tc.gc.ca/eng/marinesafety/ocp-inspection-psc-menu-1120.htm>
- Cooperative Vessel Traffic System -- <https://www.gpo.gov/fdsys/pkg/CFR-2006-title33-vol2/xml/CFR-2006-title33-vol2-sec161-55.xml>
- SOLAS (general description – full text on available online and publication is available for a price) -- [http://www.imo.org/en/About/Conventions/ListOfConventions/Pages/International-Convention-for-the-Safety-of-Life-at-Sea-\(SOLAS\)-1974.aspx](http://www.imo.org/en/About/Conventions/ListOfConventions/Pages/International-Convention-for-the-Safety-of-Life-at-Sea-(SOLAS)-1974.aspx)
- International Convention for the Prevention of Pollution from Ships (MARPOL) -- [http://www.imo.org/en/About/Conventions/ListOfConventions/Pages/International-Convention-for-the-Prevention-of-Pollution-from-Ships-\(MARPOL\).aspx](http://www.imo.org/en/About/Conventions/ListOfConventions/Pages/International-Convention-for-the-Prevention-of-Pollution-from-Ships-(MARPOL).aspx)
- Protectively Located Fuel Oil Tanks -- https://exchange.dnv.com/Documentation/Publications/Downloads/IMO%20report_FO%20tank%20double%20sides_external.pdf

**PRESENT
AGREEMENT**

The Secretary of State for External Affairs

Secrétaire d'Etat aux Affaires extérieures

Canada
U. S. COAST GUARD
13th Coast Guard District
SEATTLE, WASHINGTON

JAN 21 1980

OTTAWA, December 19, 1979.

RECEIVED
NATIONAL MARINE SAFETY DIV.

FLM-211

Excellency,

I have the honour to refer to discussions between representatives of our two Governments for the purpose of reaching agreement on cooperative arrangements for vessel traffic management in waters near the common boundary of Canada and the United States in the region of Juan de Fuca Strait. Such arrangements are desirable for marine safety in light of increasing oil tanker and other vessel traffic in the west coast waters of Canada and the United States. The world-wide trend towards large tankers, and the possibility of their presence in coastal areas where they might add to the existing traffic, greatly strengthen the need for such cooperation.

The two Governments have already taken a number of parallel measures for safety of navigation in the Juan de Fuca area, including improved communications, surveillance radar installations and a voluntary routing system. I have the honour to propose that these cooperative arrangements be further strengthened. The attached Annex sets out the

.../2

Excellency Kenneth Curtis,
Ambassador of the U.S.A. to
Canada,
OTTAWA.

arrangements for implementation of a cooperative vessel traffic management system for the region of Juan de Fuca Strait, consistent with our shared goals of safety of navigation and preservation of the marine environment.

I have the honour to propose that if these arrangements are acceptable to the United States Government this Note, together with the attached Annex, which are authentic in English and French, and your confirming reply, shall constitute an Agreement between our two Governments for vessel traffic management in waters near the common boundary of Canada and the United States in the region of Juan de Fuca Strait. I have the honour further to propose that this Agreement enter into force on the date of your reply. This Agreement may be terminated by either Government upon six months' notice to the other or upon such longer period as may be specified in the notice of termination.

Secretary of State for
External Affairs.

EMBASSY OF THE
UNITED STATES OF AMERICA
Ottawa, December 19, 1979

No. 341

Madame,

I have the honor to refer to your note No. FLM-211 of this date, and to its Annex, proposing cooperative arrangements for joint management of vessel traffic in waters near the common boundary of Canada and the United States in the region of Juan de Fuca Strait.

I have the further honor to confirm that the cooperative arrangements set forth in your Note and its Annex are acceptable to the Government of the United States, and that your Excellency's Note and its Annex, together with this reply, shall constitute an agreement on this subject between our two Governments which will enter into force on the date of this Note.

Accept, Madame, the renewed assurances of my highest consideration.

James M. Carter

The Honorable

Flora MacDonald, P.C., M.P.

Secretary of State for External Affairs

ANNEX

AGREEMENT FOR A COOPERATIVE VESSEL TRAFFIC MANAGEMENT
SYSTEM FOR THE JUAN DE FUCA REGION

100 PURPOSE AND OBJECTIVE

100.1 The purpose of this Agreement is to provide for a cooperative system of vessel traffic management in the applicable waters.

100.2 The objective of this Agreement is to enhance safe and expeditious vessel traffic movement and to minimize risk of pollution of the marine environment in the applicable waters by setting forth standards and procedures for:

- (a) establishing a cooperative system of vessel traffic management;
- (b) ascertaining through pre-clearance procedures and subsequent traffic monitoring, vessel compliance with pertinent regulations, procedures and practices; and alerting responsible authorities where non-compliance occurs;
- (c) monitoring traffic movements to the degree required of the locality;
- (d) providing on a routine basis, or on request, real time information to mariners on traffic, navigational dangers, weather and other safety matters;
- (e) providing on request position fixing data where this capability exists;
- (f) responding to emergency situations.

101 DEFINITIONS

101.1 Applicable Waters

Means the waters on the southern coasts of British Columbia and the northern coasts of the State of Washington that are bounded:

- (1) in the waters through which the international boundary runs,
 - (a) on the north, by the 49° north parallel of latitude,
and

(b) on the south and east, by a rhumb line joining Point Partridge (Whidbey Island) and McCurdy Point (Quimper Peninsula); and

(2) in the waters to seaward

(a) on the northwest, by the 48°35'45" north parallel of latitude,

(b) on the southwest, by the 48°23'30" north parallel of latitude, and

(c) on the west, by the rhumb line joining 48°35'45"N., 124°47'30"W. with 48°23'30"N., 124°48'37"W.

101.2 Authority

Means the Commissioner of the Canadian Coast Guard or the Commandant of the United States Coast Guard.

101.3 Berth

Means any wharf, pier, anchorage or mooring buoy.

101.4 Canadian Vessel Traffic Regulator or U.S. Watch Supervisor

Means the person at a vessel traffic management centre authorized by the appropriate Authority to administer the vessel traffic management regulations.

101.5 Cooperative Vessel Traffic Management System

Means the cooperative system of vessel traffic management established within the applicable waters pursuant to this Agreement.

101.6 Exchange Line

Means a sector boundary where vessel traffic passes from management by one Authority to management by the other Authority.

101.7 Parties

Means the Government of Canada and the Government of the United States of America.

101.8 Routing System

Means any system of routing measures aimed at reducing the risk of casualties, including traffic separation schemes, two-way routes, recommended tracks, areas to be avoided, inshore traffic zones, roundabouts, precautionary areas and deep water routes.

101.9 Sector

Means a subdivision of the applicable waters geographically defined for purposes of allocating the responsibility for vessel traffic management to one of the Authorities.

101.10 Traffic Clearance

Means an authorization by a Canadian vessel traffic regulator or a U.S. watch supervisor for a vessel to enter the cooperative vessel traffic management system, depart a berth, proceed or manoeuvre within the applicable waters.

101.11 Vessel

Means every description of water craft, including non-displacement craft and seaplanes, used or capable of being used as a means of transportation on water.

101.12 Vessel Traffic Management

Means the management of vessel traffic by the use of such procedures and equipment as may be agreed by the Authorities, including vessel movement reporting systems, radar surveillance equipment, standard operation procedures and routing systems.

101.13 Vessel Traffic Management Centre

Means a centre established by the appropriate Authority for managing vessel traffic in the cooperative vessel traffic management system.

101.14 Vessel Traffic Management Regulations

Means regulations promulgated by each Party for vessel traffic management pursuant to this Agreement.

102 APPLICATION TO VESSELS

102.1 Except as otherwise herein provided this Agreement shall apply to all vessels.

102.2 Any vessel that is exempt from compliance with the provisions of this Agreement shall observe the ordinary practice of seamen and, so far as is reasonable and practicable, act in a manner consistent with this Agreement.

103 EXCHANGE LINES

103.1 The Exchange Lines in the applicable waters are as follows:

- (a) The 124°40' west meridian of longitude in the Juan de Fuca Strait from the Canadian low-water line to the U.S. low-water line as depicted on official charts;
- (b) Donaldson Island in position 48°19'54"N., 123°42'24"W. to position 48°13'37"N., 123°31'36"W.; thence to position 48°12'32"N., 123°24'24"W.; then to Hein Bank in position 48°21'06"N., 123°02'30"W.; thence to Cattle Point, San Juan Island in position 48°27'00"N., 122°57'42"W.;
- (c) Lime Kiln Point in position 48°31'00"N., 123°09'06"W. to Kellet Bluff in position 48°35'18"N., 123°12'03"W.; thence to Turn Point in position 48°41'20"N., 123°14'10"W.; thence to Skipjack Island in position 48°44'00"N., 123°02'16"W.; thence to Clements Reef in position 48°46'42"N., 122°53'22"W.; thence to Alden Bank Buoy in position 48°50'24"N., 122°52'10"W., thence in a 000° direction to the point of intersection with the 49°00'N. parallel of latitude.

103.2 The Exchange Lines may be modified by agreement of the Authorities, pursuant to recommendations of the Joint Coordinating Group established under this Agreement.

200 JOINT POLICY

201 JOINT PROCEDURES

- 201.1 The Parties agree that the development and implementation of the cooperative vessel traffic management system is best achieved by:
- (a) developing and issuing vessel traffic management regulations and developing standard procedures at the headquarters level of the Authorities;
 - (b) developing the local vessel traffic management technical and operational details at the regional and district level of the Authorities, within the framework of national standards, with headquarters consultation; and
 - (c) developing routing systems and vessel traffic management systems taking into account, where appropriate, standards developed at IMCO on ships' routing and ship movement systems.

202 SYSTEM COMPATIBILITY

202.1 The Parties agree that the cooperative vessel traffic management system procedures and regulations in each country shall be compatible, to the extent possible, with those in the other and that any joint traffic separation scheme shall be submitted to the Inter-Governmental Maritime Consultative Organization.

203 REGULATING OF VESSEL TRAFFIC

203.1 Each Party undertakes to promulgate all vessel traffic management regulations necessary to give effect to this Agreement. The Authorities shall jointly determine the vessels to which particular regulations shall apply.

204 COMPATIBILITY OF OTHER REGULATIONS AND THEIR ENFORCEMENT

204.1 The Parties recognize the desirability of compatibility in their respective national regulations bearing on marine safety and environmental protection applicable to vessels using the cooperative vessel traffic management system. The Parties further recognize the desirability of consultation and coordination between the Authorities to promote compatibility of these regulations to the fullest extent practicable consistent with domestic law and policy. At the request of either Authority, the other will provide an opportunity for consultation and coordination concerning such regulatory measures significantly affecting vessels using the cooperative vessel traffic management system.

204.2 The Parties consider that their respective vessel design, construction, manning and equipment requirements, and the measures for enforcement of these requirements, provide a comparable degree of marine safety and environmental protection and that their cooperative application will enhance the effectiveness of the vessel traffic management system. Each Party recognizes that vessels meeting its own standards enter the waters of the other Party in accordance with the agreed routing system. Each Party, in applying its regulations to vessels proceeding through its portion of the applicable waters solely en route to or departing from a port of the other Party, will consider compliance with the requirements of the other Party to be effectively equivalent to material compliance with its own requirements, so long as the requirements and enforcement practices of the other Party, in their totality, continue to provide a comparable degree of marine safety and environmental protection.

204.3 Nothing in Article 204 shall derogate from the right of each Party to take appropriate measures in accordance with its law in its portion of the applicable waters in relation to any specific vessel, the condition or activities of which may pose an actual threat to marine safety or the marine environment. In order to facilitate cooperative enforcement action each Authority will consult at the request of the other, where time permits, concerning enforcement measures to be taken in particular situations posing a threat to marine safety or the marine environment in the applicable waters.

204.4 Should either Party consider making a determination that the requirements and measures for enforcement referred to in 204.2, in their totality, no longer provide a comparable degree of marine safety and environmental protection, that Party will notify the other Party and offer to consult on the matter. No final determination will be made in this respect for at least six months from the time of initial notification in order to allow sufficient time for the consultation process to be completed.

205 RELATION TO NATIONAL LAW AND POLICY

205.1 This Agreement and actions hereunder shall be without prejudice to the position of the Governments of the United States and Canada with respect to the character of, and the nature and extent of coastal state jurisdiction, over the applicable and adjacent waters:

206 RESPONSIBILITY FOR SAFE NAVIGATION

206.1 It is not the purpose of the cooperative vessel traffic management system instituted under this Agreement to attempt to manoeuvre or navigate vessels from the shore. Therefore, the responsibility for safe navigation shall remain with the vessel's master or commanding officer. Notwithstanding any requirement in the vessel traffic management regulations, the master or commanding officer of the vessel shall retain the responsibility to take any action which by the ordinary practice of seamen or by any special circumstances is necessary to ensure safety of life or the safety of his own or any other vessel.

207 ENFORCEMENT

207.1 In the applicable waters under its jurisdiction, each Party shall enforce compliance with its vessel traffic management regulations.

208 NAVAL VESSELS AND GOVERNMENT VESSELS

208.1 Warships, naval auxiliaries and other vessels used for the time being for military purposes in non-commercial service will comply with the provisions of this Agreement, except when compliance would impair defence operations or defence operational capabilities. To the extent that it is consistent with the nature of these operations notice will be given to the vessel traffic management centre concerned.

208.2 Other vessels owned and operated by a State and used for the time being only on Government non-commercial service and performing governmental functions in the applicable waters will comply with the provisions of this Agreement, except when compliance would impair the performance of governmental functions of a marine contingency nature. To the extent that it is consistent with the nature of the governmental functions being performed, notice will be given to the vessel traffic management centre concerned.

300 OPERATIONAL ELEMENTS

301 VESSEL TRAFFIC CLEARANCE

301.1 Prior to entering the cooperative vessel traffic management system or departing a berth within the system, each vessel shall obtain a traffic clearance in accordance with procedures to be agreed upon between the Authorities.

302 VESSEL TRAFFIC MANAGEMENT CENTRES

302.1 Vessel traffic management centres shall be established as necessary to manage and coordinate vessel traffic. These centres shall be in communication with each other by dedicated communications circuits in order to ensure real time knowledge of the total vessel traffic pattern in the applicable waters.

303 METHOD OF OPERATIONS

303.1 Each vessel traffic management centre shall, within its applicable sector:

- (a) maintain VHF-FM radio contact with and receive reports from each vessel subject to the communications and movement reporting requirements of the vessel traffic management regulations;
- (b) maintain an accurate and up-to-date plot of all such vessels;
- (c) maintain an accurate and up-to-date status display of all known hazards to navigation, including adverse weather conditions, large concentrations of fishing or recreational vessels, and discrepancies in aids to navigation;
- (d) disseminate the information referred to in sub-paragraph (c) to all participating vessels that may be affected;
- (e) provide, upon request, position fixing assistance, within the capability of the centre;
- (f) in accordance with an agreed procedure, issue a vessel traffic clearance;
- (g) in accordance with an agreed procedure, transfer responsibility between centres for each vessel at the time it crosses an exchange line; and
- (h) upon detecting or becoming aware of any violation of the vessel traffic management regulations, report the violation to the appropriate enforcement official of the Party in whose waters the violation occurred.

304 SECTOR MANAGEMENT AND RESPONSIBILITY

304.1 All vessel traffic within the applicable waters to seaward of the exchange line established in subsection 103.1(a) shall be managed by Tofino Traffic Centre.

304.2 All vessel traffic to the east of the exchange line established by subsection 103.1(a) and to the south and east of the exchange lines established by subsections 103.1(b) and 103.1(c) shall be managed by the Seattle Traffic Centre.

304.3 All vessel traffic to the north and west of the exchange lines established by subsection 103.1(b) and 103.1(c) shall be managed by Vancouver Traffic Centre.

305 POLLUTION CONTINGENCY SUPPORT

305.1 In the event of a pollution incident occurring within the applicable waters where a response by one or both Parties under the terms of the Joint Canada/United States Marine Pollution Contingency Plan is required, the Authorities shall cooperate to the maximum extent practicable with the On-Scene Commander.

306 STANDARDS OF SHORE BASED EQUIPMENT

306.1 The Parties agree it is desirable to establish at the earliest feasible time a positive method of surveillance, generally radar where practicable, to ensure compliance with vessel traffic management regulations.

306.2 Except as they may otherwise agree, each authority shall be responsible for establishing, operating, and maintaining:

- (a) VHF-FM communications coverage within its sectors, and
- (b) radar surveillance systems incorporating provisions for the identification and tracking of vessels as follows:
 - (1) Canada: Strait of Georgia and Haro Strait from Point Roberts to Race Rocks; and on the west coast of Vancouver Island, from Estevan Point to Cape Flattery, Washington.
 - (2) United States: the Strait of Juan de Fuca from Cape Flattery to Whidbey Island; and Rosario Strait from Cherry Point to the southern entrance in the vicinity of Whidbey Island.

307 JOINT COORDINATING GROUP

307.1 The Authorities shall establish a Joint Coordinating Group at the Regional/District level. This Group shall have a permanent membership consisting of two VIM representatives from each Authority, one of whom shall serve as the Chairperson and that office shall alternate annually between each Authority. This Group may seek expert advice as it may deem appropriate. A meeting of the Joint Coordinating Group may be called by either Authority but in any event, it shall meet and submit a report to the Authorities annually.

307.2 The functions of this Group shall be:

- (a) to receive and respond to representations by interested parties on operational problems of a local nature;
- (b) to review and make early reports to both Authorities regarding the findings of any casualty investigation authority when a factor in its investigation concerns the management of traffic in the cooperative vessel traffic management system;
- (c) to review and make recommendations to the Authorities concerning operating procedures and regulations;
- (d) to review and make recommendations to the Authorities respecting modifications of the exchange lines established by section 103.1 of this Agreement;
- (e) to advise the Authorities on policy and standards;
- (f) to recommend to the Authorities consultative and operational procedures to be followed when a vessel is found to be in contravention of the vessel traffic management regulations; and
- (g) to facilitate consultations between the Authorities on the effective implementation of this Agreement.

308 COMMUNICATIONS

308.1 The Parties undertake to promulgate in consultation with each other appropriate communications regulations to ensure reliable and effective two-way voice communications throughout the vessel traffic management system.

309 AIDS TO NAVIGATION

309.1 The establishment and maintenance of aids to navigation in the applicable waters shall remain the responsibility of the Authority in whose territory or water the aids to navigation are located, except as may be otherwise expressly agreed by the Parties.

400 ADMINISTRATION AND RESPONSIBILITY

400.1 The Authorities shall be responsible for the administration of this Agreement.

400.2 The federal officers having Regional/District responsibilities for administration and operation of the cooperative vessel traffic management system are:

For Canada: The Regional Director,
Canadian Coast Guard,
Western Region.

For United States: The Commander,
Thirteenth Coast Guard District.

401 AMENDMENTS

401.1 Amendments to this Agreement may be made by mutual agreement of the Parties.

402 IMPLEMENTATION

402.1 The Authorities shall implement the cooperative vessel traffic management system as soon as possible, subject to appropriation of funds.

402.2 Each Party shall bear the costs of its own operations conducted pursuant to this Agreement.

INTRODUCTION

The Strait of Juan de Fuca and its approaches, Puget Sound, the San Juan Island Archipelago, Haro Strait, Boundary Pass, and the Strait of Georgia are regions of the Salish Sea collectively managed by Seattle, Tofino, and Victoria Traffic Services. This cooperatively managed portion of the Salish Sea is a vastly complex waterway, a pristine ecosystem, and part of a commercially and economically critical port infrastructure utilized by a myriad of vessel types. In addition to large commercial traffic destined for the refineries and bulk or container terminals, the Salish Sea has historically supported a valuable commercial fishery, and a large recreational vessel fleet. The establishment and operation of Vessel Traffic Service Puget Sound (VTSPS) or "Seattle Traffic" under the authority of the Ports and Waterways Safety Act, is a major effort by the U. S. Coast Guard to ensure the continued safe use of these waters for its many diverse users.

The purpose of Vessel Traffic Service Puget Sound is to facilitate the safe, secure and efficient transit of vessel traffic to assist in the prevention of collisions or groundings that could cost lives, property damage, or subject the pristine waters of the Salish Sea to environmental harm. VTSPS provides all three levels of VTS services defined by the International Association of Marine Aids to Navigation and Lighthouse Authorities (IALA) to assist the mariner in the formation and execution of sound navigational decision making. These services include: Information Service, Navigation Assistance Service and Traffic Organization Service.

The primary function of VTS Puget Sound is to facilitate good order and predictability on the Salish Sea waterways by coordinating vessel movements through the collection, verification, organization, and dissemination of information. To accomplish this, VTSPS uses the concept of a "continuum of traffic management." This continuum consists of the following levels of control: Monitor, Inform, Recommend, and Direct.

(1) **Monitor:** Using AIS, radar, CCTV, and radiotelephone equipment, VTS monitors vessel traffic in the VTS Area. VTS also receives information from various sources on predicted vessel movements, hazards to navigation, aids to navigation discrepancies, and other information of interest to VTS users. Monitoring vessel traffic allows us to ensure that vessels are navigating safely and efficiently in accordance with applicable regulations and the Navigation Rules.

(2) **Inform:** VTS analyzes the information gathered then informs participants as applicable. This is done when Vessel Traffic Management Specialists determine the information is relevant, or at the user's request, or at periodic intervals. The purpose of informing participants is to give VTS Users timely information to allow them to make decisions concerning the navigation of their vessels.

(3) **Recommend:** Almost all of VTS Puget Sound's operations are conducted at the monitor and inform levels. However, at certain times the VTS will recommend action be taken by a participant to prevent a potentially dangerous situation. Such recommendations are offered to assist the participant in avoiding hazardous situations early on. Recommendations are made on the pretence that there is information available to VTS of which the participant may not be aware. ([Return to TOC](#))

(4) **Direct:** On rare occasions (and during heightened security conditions) VTS may direct movement or actions of a participant. Direction is typically given in cases when the VTS observes obvious violations of regulations, or an immediately dangerous condition exists which the participant is, or appears, unaware of. Directions will normally be in the form of a general objective such as staying out of a certain area, proceeding to an anchorage or berth, passing no closer than a certain distance from a vessel or facility, or in grave situations altering course to avoid an imminent collision or grounding.

Each of the above actions - monitor, inform, recommend and direct, are independent of each other and one action does not necessarily precede the other. The ultimate responsibility for safe navigation of a vessel remains with the master or person in charge.

This manual contains Vessel Traffic Service regulations contained in 33 CFR 161 and references to other applicable regulations essential to navigating in the VTS Puget Sound Area. Carriage of these regulations is mandatory for Vessel Movement Reporting System (VMRS) and VTS Users. This manual meets 33 CFR Part 161.4 “Requirement to carry the rules.” This publication may be downloaded from the VTS website, but is **not for resale**.

Section 1 of this manual offers a Vessel Operator Quick Reference Guide section useful to identify participatory requirements. Section 2 contains VTS Operating Rules and Reporting Requirements as stated in CFR. Sections 2 and 3 may also contain supplementary text (**bold text underlined**) that offers helpful explanation, and administrative policy regarding the rules.

VTSPS is comprised of three major components:

- (1) a Vessel Movement Reporting System (VMRS);
- (2) a Traffic Separation Scheme (TSS); and
- (3) a Surveillance system including radar, Automatic Identification System (AIS), and closed circuit television (CCTV).

VMRS: The VMRS is based upon a VHF-FM communications network maintained continuously by the Vessel Traffic Center (VTC) in Seattle. This network consists of 15 variable power sites. The location of these communication sites throughout the VTSPS Area allows mariners to contact the VTC while normally only using low power on their radio. The VTC processes all information received and disseminates navigational safety information to those vessels asking for or requiring it. Much of the information processed by the VTC is collected from vessel reports, so mariners are cautioned that advisories based on vessel reports are only as accurate as the information given to the VTC from vessels in the VTS area. A common “radio net” provides the fundamental safety component for all vessels using, or merely listening to VTS traffic.

TSS: The Traffic Separation Scheme (TSS) in the VTSPS Area has been adopted by the International Maritime Organization (IMO). Therefore, the TSS is subject to the COLREGS and all vessels are expected to comply with the provisions of Rule 10 when operating in or near the TSS. The traffic lanes, separation zone, and TSS buoys that comprise the TSS are depicted on nautical charts, and International COLREGS apply everywhere in the VTSPS Area, including Lake Washington. Several IMO defined Precautionary Areas exist within the TSS where the master or person in charge of a vessel must exercise particular caution. Most of these precautionary areas are at turns or junctions in the TSS. Vessels must keep the center

of these precautionary area to port in accordance with 33 CFR 165.1303 and consider them *roundabouts* to enhance order and predictability in traffic flow.

Surveillance: The VTC receives radar signals from 12 strategically located radar sites throughout the VTSPS area. Radar provides approximately 2,900 square miles of coverage including all waters where the TSS exists. This includes the Strait of Juan de Fuca, Rosario Strait, Admiralty Inlet, and Puget Sound south to Commencement Bay. The VTS also receives and displays Class A AIS information from 13 AIS base stations, and has a total of 14 CCTV cameras located throughout the VTSPS Area to observe critical waterways, port areas and major anchorages. Canadian Marine Communications and Traffic Services (MCTS) partners provide radar and AIS surveillance of the offshore approaches to the Strait of Juan de Fuca, Haro Strait, Boundary Pass, and Strait of Georgia.

Since 1979, the U.S. Coast Guard has worked cooperatively with the Canadian Coast Guard in managing vessel traffic in adjacent waters through the **Cooperative Vessel Traffic Service** (CVTS) <http://www.uscg.mil/d13/cvts> . An international State Department level agreement between our nations has established traffic management areas based not on international boundaries, but rather on geography and waterways to provide the best possible seamless and safest collective service for the mariner. Tofino MCTS (*Tofino Traffic, Ch. 74*), VTS Puget Sound (*Seattle Traffic, Ch. 5A, 14*) and Victoria MCTS (*Victoria Traffic, Ch. 11*) each have reporting areas that contain a component of each other's nation's waters to ensure that a single VTS service, with a single reporting frequency will be assigned to critical segments of the TSS as a matter of convenience and safety to the mariner. The service boundary line between Tofino, Seattle, and Victoria Traffic is independent of the International Boundary, and is known as the "Exchange Line." It is described in detail in this manual.

The **Puget Sound Harbor Safety Plan** provides best practices and standards of care for maritime operations in Puget Sound. The plans purpose is to mitigate risks for maritime safety and to enhance the protection of the marine environment. The plan represents the cooperative and collaborative efforts of industry leaders, Washington State, the U.S. Coast Guard and other government agencies and is strongly endorsed by the Captain of the Port Puget Sound. The plan can be found at www.pshsc.org

Section 1

Vessel Operator Quick Reference Guide

- *Is my vessel required to participate with VTS Puget Sound or a Canadian MCTS Center, and to what extent is my vessel required to participate?*
- *Which VTS/MCTS Center do I report to?*
- *What is the Cooperative Vessel Traffic Service (CVTS) Area?*
- *How do I communicate and participate with VTS?*
- *May I participate as a full VMRS (Vessel Movement Reporting System) User even if my vessel is not required to?*
- *How far in advance should I provide a Sail Plan?*
- *Do I need to guard Channel 16?*
- *May I use the VTS frequency for passing arrangements?*
- *Are all vessels subject to VTS Measures?*
- *What are the Rosario Strait and Guemes Channel Special Area Regulations?*
- *What is the Turn Point Special Operating Area?*
- *If VTS Service is interrupted in my area, what should I do?*

➤ ***Is my vessel required to participate with VTS Puget Sound or a Canadian MCTS Center, and to what extent is my vessel required to participate?***

All vessels are to observe the VTS or MCTS regulations of the host nation’s territorial waters, regardless of which nation’s VTS or MCTS service is actively managing your transit. Refer to Tables 1-4 to determine your vessel’s participation requirements, whether *FULL*, *PASSIVE* or *MINIMAL*, and what these requirements are, while operating in U.S. territorial waters. Refer to [Table 5](#) to determine your vessel’s participation requirements while operating in Canadian waters. All vessels are subject to VTS Measures or Directions, the 1972 International Collision Regulations, and all other safe and prudent practices of seamanship while in the VTS Puget Sound Area. Additionally, all vessels are subject to the regulations listed in the Radio Aids to Marine Navigation (RAMN) Manual while in Canadian waters.

<i>Your Vessel (VMRS User Class)</i>	<i>VTS participation requirements in U.S. Navigable waters of the Salish Sea.</i>
Power Driven 40 meters or greater in length while navigating.	FULL Participation. See Table 4
Every towing vessel of 8 meters or greater in length, while navigating (engaged in towing).	FULL Participation.
Every vessel certificated to carry 50 or more passengers for hire, when engaged in trade (includes dead heading for passengers).	FULL Participation.
Section 1 Table 1	

<i>Your Vessel (VTS User Class)</i>	<i>VTS participation requirements in U.S. Navigable waters of the Salish Sea.</i>
Power Driven 20 meters or greater in length while navigating.	PASSIVE Participation. See Table 4
Every vessel of 100 gross tons or more carrying 1 or more passengers for hire, while navigating	PASSIVE Participation.
A dredge or floating plant	PASSIVE Participation.
Section 1 Table 2	

<i>Your Vessel (All Waterborne Craft)</i>	<i>VTS participation requirements in U.S. Navigable waters of the Salish Sea.</i>
<i>Any vessel not defined as VMRS or VTS User Class in Tables 1 and 2 –to include every description of water craft, including nondisplacement craft, and seaplanes per Rule 3, International Navigation Rules, that can be used or capable of being used as a means of transportation on the water.</i>	MINIMAL Participation. See Table 4
	Section 1 Table 3

<i>Your Vessel Class</i>	<i>Participation requirements in U.S. Navigable waters of the Salish Sea.</i>
All Waterborne Craft <i>(Not defined as VMRS or VTS User Class.)</i>	<ol style="list-style-type: none"> 1. Adherence to 1972 Collision Regulations (72 COLREGS) 2. Subject to VTS Measures (when VTS direction is issued under authority of 33 CFR 161.11) 3. Adherence to all other practices of safe navigation and prudent seamanship.
<i>1-3 Minimal.</i>	
VTS User Class	ALL of the above (1-3) and:
<i>1-6 Passive Participation.</i>	<ol style="list-style-type: none"> 4. Shall monitor the designated VHF-FM VTS frequency for the area in which they are operating, and Channel 13. 5. Shall respond to VTS (Seattle Traffic) if hailed. 6. Shall comply with general VTS operating rules.
VMRS User Class	ALL of the above (1-6) and:
<i>1-7 Full participation.</i>	<ol style="list-style-type: none"> 7. Shall make required reports to the VTS. See Section 2, Subpart B on reporting.
	Section 1 Table 4

<i><u>Your Vessel</u></i>	<i>VTS participation requirements in Canadian waters.</i>
Commercial power driven vessels 20 meters or greater in length.	FULL Participation. Must check in and make reports.
Pleasure craft 30 meters or greater in length.	FULL Participation. Must check in and make reports.
Fishing vessels 24 meters or greater in length, <u>and</u> 150 GT.	FULL Participation. Must check in and make reports.
Towing vessels 20 meters or greater in length, or, if the object being towed is 20 meters, or, overall length of tug and tow is 45 meters.	FULL Participation. Must check in and make reports.

Section 1 Table 5

➤ *Which VTS/MCTS Center do I report to?*

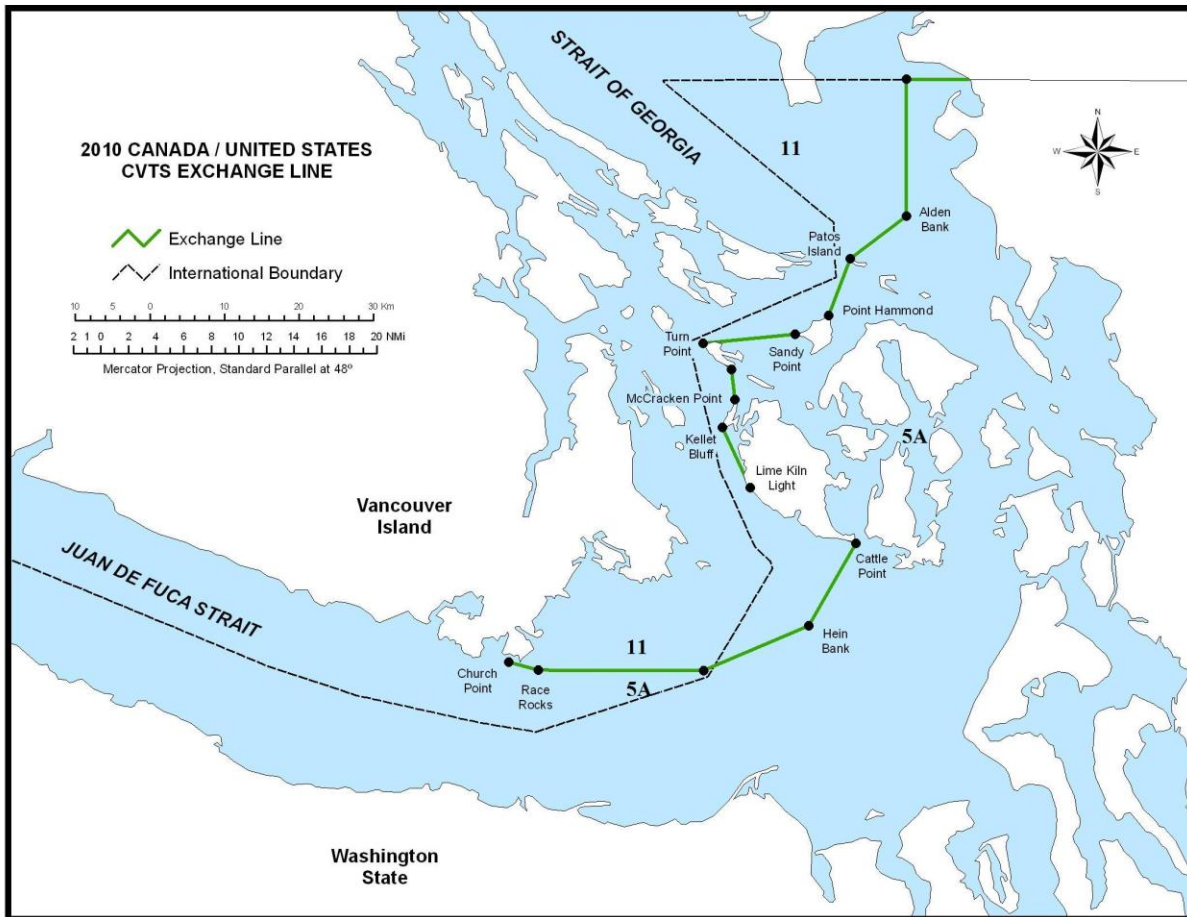

SECTOR BOUNDARY AND EXCHANGE LINES

Tofino MCTS, or *Tofino Traffic*, provides traffic services via **Ch. 74** westward of meridian 124°40'W in the Strait of Juan de Fuca, south to 48°00'N, west to 127°00'W and within 50 nm of the west coast of Vancouver Island. Refer to the latest Radio Aids to Marine Navigation Manual for requirements and the level of services that may be provided. *The 124°40' west meridian of Longitude in the Strait of Juan de Fuca is the Tofino Traffic / Seattle Traffic exchange line. Channel 5A is monitored by Seattle Traffic directly east of this meridian.*

VTS Puget Sound, or *Seattle Traffic*, has two frequency areas, **Ch. 5A and 14**. The Channel 5A (156.250 MHz) service area is used in the northern portion of the VTS Area and is situated between Tofino and Victoria's service areas. The Seattle Traffic Ch. 5A area has an *exchange line with Tofino and Victoria defined as a line drawn north from the Olympic Peninsula at 124°40'W Longitude to the Coast of Vancouver Island, thence eastward along the coast of Vancouver Island (including all the inlets and ports, i.e. Port Renfrew, and Sooke Inlet) to Church Point. From Church Point the line connects to Race Rocks Light, then due easterly to the intersection of the U.S./Canadian border at 48°17'53.0"N/123°14'06.0"W, north-easterly to Hein Bank in position 48°21'05.62"N/123°02'45.72"W, northerly to Cattle Point Light on San Juan Island, along the shoreline to Lime Kiln Light, to Kellett Bluff Light on Henry Island, along the shoreline to the tip of McCracken Point at the northernmost point of Henry Island, to the southernmost point on Stuart Island in position 48°39'28"N/123°11'05"W, along the shoreline to Turn Point Light, to Sandy Point on Waldron Island, along the shoreline to Point Hammond, to Patos Island Light, to Alden Bank in position 48°50'23.39"N/122°52'13.67"W, then due north to Boundary Bay in position 49°00'07.5"N/122°52'13.67"W, then due east along the international*

boundary to the shoreline in Semiahmoo Bay. The Channel 14 (156.700 MHz) service area is all navigable waters south of a line from Nodule Point to Bush Point in Admiralty Inlet, and south of a line drawn eastward from Possession Point on Whidbey Island to the shoreline.

Victoria MCTS, or *Victoria Traffic*, provides traffic services via **Ch. 11**, on the north side of the service exchange line described in the previous paragraph. Their service area continues northward in the Strait of Georgia past the Vancouver Traffic Zone area up to a line from Ballenas Island to Merry Island.

➤ ***What is the Cooperative Vessel Traffic Service (CVTS) Area?***

In 1979 the governments of Canada and the United States signed a formal agreement which established the CVTS system for the Juan De Fuca region and its seaward approaches. This agreement resulted through excellent cooperation and joint management and has become a model for the world and an ultimate example of international teamwork. Since its inception, this agreement has served both the peoples of Canada and the United States well in protecting our common shared marine environment and in the enhancement of maritime efficiency, trade, transportation and safety. It is a region of rugged steep cliff shorelines, deceptively strong tidal currents, often near-saturated with vessels in the traditional fishing grounds, and an ever

increasing enviro-tourism industry with the addition of whale watching. The size of ships and the amount of cargo carried have been growing steadily year by year. These ships include large Alaska crude oil tankers, fast container ships, Ro Ros, Bulklers, Cruise ships and a variety of cargo and special purpose ships, coastal vessels, tugs and tows, naval vessels of every type and fishing vessels. Many of these vessels carry dangerous/hazardous and environmentally sensitive cargoes. The region is home to one of the world's largest per capita recreational boating communities. The region's pristine rocky coasts stand as vulnerable sentinels lining the route for millions of barrels of petroleum products which move through it annually. Oceanographers estimate that a major spill in this region could blanket the entire area within two 24-hour tidal cycles. This fact alone highlights the driving environmental concerns of the CVTS as a major preventative safety measure in the continuing battle to guard against pollution of our common natural heritage. Taking all elements into consideration, navigation within the Juan De Fuca region is somewhat more complicated than it might appear simply by looking at a nautical chart. In addition, one must also keep in mind, that the 60 odd miles between the western entrance of the Strait and Victoria, BC/Port Angeles, WA is not Pilotage waters. Addressing these challenges to minimize marine occurrences to the greatest extent possible is the Cooperative Vessel Traffic Service provided by the Tofino MCTS Centre (Tofino Traffic), the USCG Puget Sound VTS Center (Seattle Traffic), and the Victoria MCTS Centre (Victoria Traffic). Through a modern technological advanced system of radar and radio communications, Coast Guard Vessel Traffic Specialist Officers from Canada and the United States provide the necessary advice, recommendations and when needed, directions to the mariner for the completion of a safe and efficient voyage irrespective of the international boundary. Through this system of shared responsibilities in our common boundary waters, the peoples of our two nations can have confidence that the challenges presented are being met regarding safety at sea, and regarding the preservation and sustaining of our life enriching environment. Today, the CVTS is a well organized and effective body that is constantly responding to changes in administrative and operational requirements determined by the dynamics of the marine industry, the environment, and the public concerns of the day. Joint Coordinating Group (JCG) meetings of the authorities of the two Coast Guards take place on a bi-annual basis as well as Operational Procedures Committee meetings. What results is a seamless, smooth, unencumbered and safe transit of this region for the mariner. The transition from one Coast Guard Traffic Centre to the next is transparent to the mariner as there is a constant focus on cooperative spirit and oneness of purpose which is achieved through common operational procedures and harmonized regulations. From 1979 to today, the CVTS has developed into an organization and system that is prepared to meet and has met the inevitable challenges in providing safe and efficient waterways management through the new millennium.

➤ ***How do I communicate and participate with VTS?***

Key requirements:

- (a) Each VMRS user and VTS user must have a combination of radio equipment capable of operating from the navigational bridge, that simultaneously maintains a listening watch on Channel 13 (156.650Mhz), **and** the designated VTS frequency.
- (b) A single VHF/FM radio capable of scanning, or with "dual watch" capability, will **not** meet the requirement of two radios.
- (c) A VHF watch on Channel 16 is not required on vessels subject to the Vessel Bridge-

to-Bridge Radio Telephone Act, during participation with the VTS while maintaining a watch on Channel 13, and the VTS frequency.

- (d) A person required to maintain a listening watch must be able to communicate in the **English** language. Use of Message Markers (page 5-8) is recommended when necessary.
- (e) Any fixed or portable radiotelephone equipment capable of transmitting and receiving on the designated VHF frequency may be used.

If required to make reports, then it is the vessel operator's responsibility to initiate communications with VTS. Listen for a moment before keying the radio, and with the use of low power, address the VTS as "**Seattle Traffic**" followed by the name of your vessel –using the appropriate VTS frequency. This communication is initiated before getting underway within, upon entry to, or exiting a VTS service area –in accordance with the reporting requirements of your vessel as stated in Section 2 of this manual. A 'Sail Plan' is expected in the first report upon establishing communications. An initial conversation with the VTS may be phrased like this:

"Seattle Traffic, this is the (*vessel type and name*) checking **in** at (*current location*) on channel (5A/14) over." After acknowledgement, proceed with your sail plan information. See Section 2 for sail plan reporting.

If you are beginning your voyage, a full sail plan should follow your check in call. If your vessel is 'handed off' while underway between Tofino, Seattle, or Victoria zones, typically all of your vessel voyage information will have been sent electronically to the adjacent VTS Center, although you may be asked to repeat some of your sail plan information. You should always report any changes to your original sail plan information.

A final report with the VTS may be phrased like this:

"Seattle Traffic, this is the (*vessel type and name*), checking **out** at (*the final docking/anchorage location or upon leaving the VTS Area*), on channel (5A/14), over."

Your vessel *may* be asked to provide "Position Reports" while operating in U.S. waters –these requests are a lawful direction in the interest of navigational safety. "*Motor vessel _____, this is Seattle Traffic, request a call when you exit the west waterway, over.*" Another example would be a request to *call Seattle Traffic when your vessel is actually underway* -free of lines or anchor from a dock or anchorage. In Canadian waters, vessels are required to make autonomous position reports via RAMN published "calling in points" -*if* your vessel is a required participant under Canadian regulations.

In regard to switching service areas: If not first contacted by a VTS or MCTS, you are required to initiate radio communications upon departure from a service area, with the appropriate VTS or MCTS over the appropriate frequency, then immediately initiate 'check in' communications with the new service provider, on the new appropriate frequency.

If difficulty arises in making required reports to Seattle Traffic, you may try our alternate frequency of Channel 13, or call Seattle Traffic via cell phone at (206) 217 6151/52 to report a

communications problem. Inability to communicate over designated frequencies may be cause to terminate a voyage. Seattle Traffic communicates with the Canadian MCTS Centres both electronically and via phone lines, so reporting a radio or equipment casualty to one Center can be relayed to another when necessary.

➤ ***How far in advance should I provide a Sail Plan?***

It is requested that a Sail Plan report of your *voyage* (not including vessels with reporting exemptions such as ferries on a published schedule, harbor assist and escort, or local shift) should occur **15** minutes, *but not more than 45 minutes*, before actual departure from a dock or anchorage within the VTS area. If you are already underway in another VTS service area, and approaching our VTS area, a position report is needed as you cross the service area exchange line.

“Seattle Traffic, this is the (*type, name*) at (*pier or anchorage location description*), over.” –wait for response- “Seattle Traffic, in (*15-45 minutes*) we will be departing (*location*) for (*destination, and ETA if terminating in our Seattle Traffic area, no ETA is necessary if you are destined for a port not in the Seattle Traffic area*) and will be using (*the traffic scheme and/or particular route*), (*and inclusion of sail plan applicable details such as the number and type of barges, loaded or empty, dangerous cargo –yes or no, in product or ballast if a petroleum tanker, with passengers for tour vessels*), over.”

A **local** shift within a port (see *Reporting Exemptions in 33 CFR 161.23*) requires a Sail Plan, but not a Position or Final Report *-unless* requested by the VTS. A local shift report shall be provided at least **5** minutes, *but not more than 15 minutes*, before navigating within the VTS area. In practical application, a vessel shifting within a port (i.e. Seattle 115 to Pier 90), is considered a local shift with reporting exemptions -regardless of the 3 nautical mile radius rule. Most likely, however, the VTS will ask for a Position or Final Report to help safely manage Duwamish River and Elliott Bay traffic. Be sure to include a valid ETA in your local shift Sail Plan, or update as necessary, so the VTS will know when to terminate your vessel track tag if a Final Report is not requested.

➤ ***May I participate as a full VMRS (Vessel Movement Reporting System) User even if my vessel is not required to?***

If necessary, *any* vessel otherwise not required to make radio reports as a VMRS User, may be lawfully *directed* to do so by the VTS.

Any vessel otherwise not required to make radio reports, may *voluntarily* report, and their participation may be accepted by VTS depending on prevailing workload, radio saturation conditions and based on VTS’s ability to track your vessel. Often lite tugs, fishing vessels, sailing vessels, and other waterborne craft may wish to call Seattle Traffic and request to participate as a full VMRS User by making *VTS reports* listed in Section 2 of this manual, or to receive a one-time traffic report to address navigation safety concerns or hazards in their immediate vicinity (particularly in restricted visibility). VTS will accommodate to the extent possible and services may be adapted or limited on a case by case basis. General geographic advisories are often issued ‘in the blind’ to advise all listeners, *known or unknown*, of traffic

dangers, or to advise listeners either as groups or singularly to observe specific International Collision Regulations.

Some VTS Users may choose to operate as VMRS Users. The VTS generally allows this reporting, or will take information to the extent necessary to monitor their transit as an active track tag. Some circumstances that may warrant a vessel to be treated as a full VMRS User could include a lite commercial tug of 20 meters or greater in length transiting from U.S. to Canadian waters, or a 24 meter/150 gross ton fishing vessel leaving the Ballard Locks area bound for Alaska. Since both of these vessels *will eventually be required to check in with a Canadian MCTS Centre*, it is best to check in with Seattle Traffic *first*, to facilitate a seamless handoff to the Canadian MCTS Centre.

Any waterborne craft that has *no* reporting or passive listening requirements whatsoever is highly *encouraged to listen* to the VTS frequency for the area they operate, along with dutiful monitoring of Channel 16. Larger vessels (VMRS and VTS User class vessels) that are participating with a VTS are not legally required to monitor Channel 16, but instead are required to monitor the VTS Channel and Channel 13 on separate radios. Thus, merely listening to the VTS frequency and hailing large vessels via Channel 13 to make passing arrangements will greatly enhance the navigation safety of smaller waterborne craft.

Small recreational vessels, vessels engaged in fishing, and sailing vessels may not be observable on VTS tracking sensors. Radar is utilized by VTS in harbors and areas that contain traffic separation schemes, however, radar energy may not paint a definite 'return' for small vessels depending on the vessel's area of operation or hull composition. AIS tracking is displayed throughout the VTS Area, however VTS tracking systems only display Class A AIS, not Class B AIS. Vessels, under Rule 10 of the International Collision Regulations, are responsible for knowing their own proximity to the Traffic Separation Scheme (traffic lanes, separation zone and connecting precautionary areas), and avoid it by as wide a margin as is practicable if not using the TSS.

➤ ***Do I need to guard Channel 16?***

Although VMRS and VTS Users are exempt from monitoring Channel 16 while complying with VTS participation regulations (reference 47 CFR 80.148(b) exemption), VMRS and VTS User class vessels are encouraged to also actively guard Channel 16 if able to do so, along with continuous monitoring of the appropriate VTS frequency, AND Channel 13, on separate radios, while in U.S. waters. Many smaller vessels may be unaware of the Channel 16 exemption status, and may attempt to hail larger vessels on Channel 16 in an emergency, which is the appropriate frequency for a vessel of their class in U.S. or Canadian waters.

➤ ***May I use the VTS frequency for passing arrangements?***

Although Channel 13 is the designated Bridge to Bridge Navigation Safety frequency for making passing arrangements, the use of VTS Channel 5A is allowable and encouraged for the exchange of passing arrangements or other navigation safety information - particularly in the Strait of Juan de Fuca area west of Port Angeles. VTS Channel 14 may be used for passing arrangements

when necessary. Canada does not have a designated Bridge to Bridge Radiotelephone Frequency while in Canadian waters, and vessels that need to exchange passing arrangements should go to an agreed 'channel of convenience' in Canadian waters.

➤ ***Are all vessels subject to VTS Measures?***

Many smaller 'vessels of consequence' without radio or identity can negatively impact traffic flow in or near traffic separation schemes. Many of these vessels, due to their size, may come and go undetected by VTS sensors and tracking systems. Regardless, all waterborne craft are subject to issuance of VTS Measures (Participation requirements 1-3 in Section 1 Table 4).

➤ ***What are the Rosario Strait and Guemes Channel Special Area Regulations?***

The Rosario Strait and Guemes Channel VTS Special Areas are monitored and enforced by Seattle Traffic under authority of the Captain of the Port.

The Rosario Strait and Guemes Channel VTS Special Areas are defined as those waters bounded on the south by the center of the "RB" precautionary area and to the north by the center to the "C Buoy" precautionary area, and those waters bound to the west by Shannon Point on Fidalgo Island and to the east by Southeast Point on Geumes Island. Additionally, through policy and proposed rulemaking, the waters of Bellingham Channel, Padilla Bay and Samish Bay south of 48°38'25"N including the Saddlebag route is also subject to the Special Area operating requirements to promote maritime safety.

In the eastern San Juan Island archipelago, the combined effects of the 33 CFR 161.13 and 161.55 regulations are:

1. A vessel of less than 100 meters does not require VTS permission to meet, cross, or overtake any other VMRS User in the area.
2. A vessel of 100 meters or more in length will not be permitted to meet or overtake; or cross or operate within 2,000 yards (except when crossing astern) of a vessel of 40,000 DWT or greater.
3. A vessel of 40,000 DWT or more will not be permitted to meet or overtake; or cross or operate within 2,000 yards (except when crossing astern) of a vessel 100 meters or more in length.
4. A VTS User engaged in towing shall do so with as short a hawser as safety and good seamanship permits, and shall not impede the passage of a vessel of 40,000 DWT or more.
5. A vessel of 40,000 DWT or greater always requires prior VTS approval to enter or get underway in the special area. All other VMRS Users do not, unless a hazardous vessel operating condition or circumstance exists. *Permission to enter a special area with a*

known vessel defect or hazardous condition, or continue a transit if a hazardous condition develops within the special area itself, requires explicit approval of the Captain of the Port after contacting the VTS. Special conditions or restrictions may be placed upon the vessel, or authorization may be withheld. An alternate route around the special area may be recommended.

**Ballast state does not exempt a vessel of 40,000 DWT from the necessity to gain VTS authorization to enter or get underway in a special area.*

6. All VMRS Users must make safe passing arrangements on Channel 13 prior to meeting, crossing, or overtaking in the special area, and must comply with all other applicable International Collision Regulations.

➤ ***What is the Turn Point Special Operating Area?***

The Turn Point Special Operating Area (SOA) is monitored and enforced by Victoria MCTS.

The Turn Point SOA has been established to enhance order and predictability, the efficient and safe movement of goods and services, and to further reduce the risk of accidents with respect to vessels transiting the boundary waters of Haro Strait and Boundary Passage in the vicinity of Turn Point on Stuart Island, Washington.

The Turn Point SOA consists of those Canadian and United States waters contained within a four sided area connected by the following coordinates:

48 41.324 N 123 14.245 W (Turn Point Light, LL255/US 19790);
48 42.400 N 123 13.967 W;
48 41.087 N 123 17.631 W (Arachne Reef Light, LL254.3);
48 39.732 N 123 16.438 W (Tom Point Light, LL225).

APPLICATION:

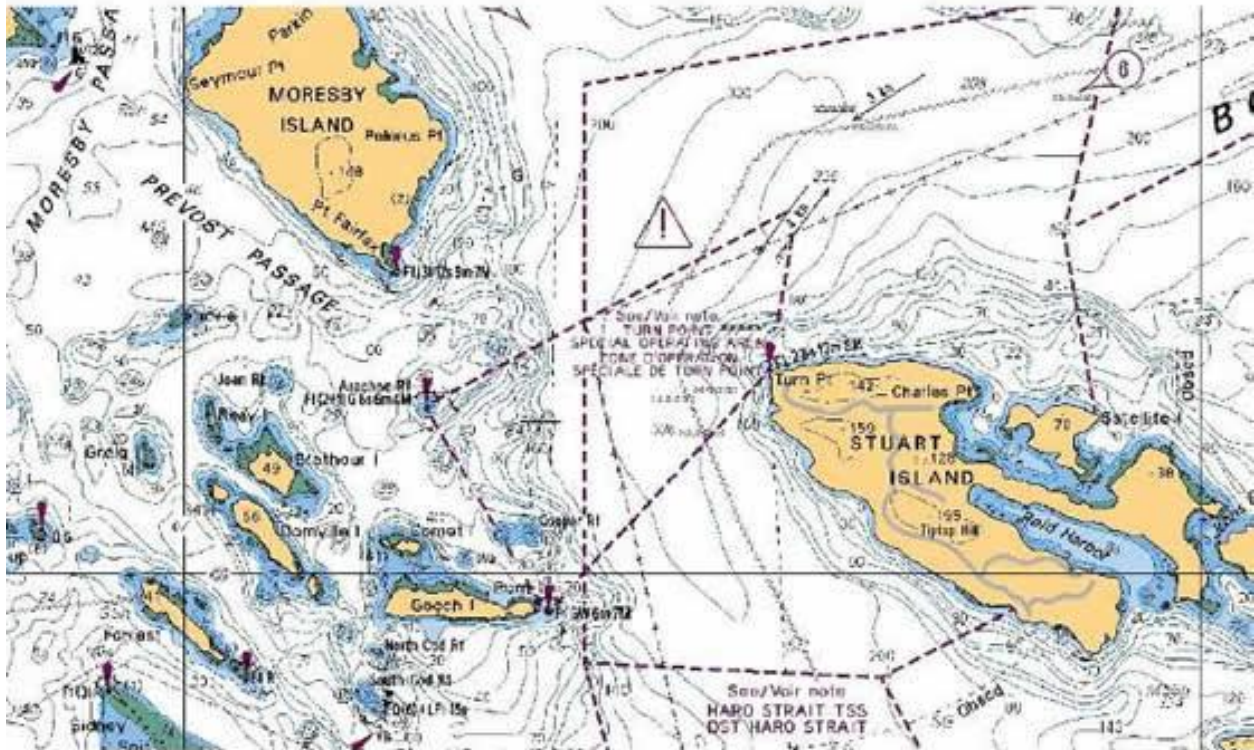

These procedures apply to all Canadian and United States VTS participant vessels within or approaching the Turn Point SOA from Boundary Passage, southbound for Haro Strait; and from Haro Strait, northbound for Boundary Passage or Swanson Channel, however, they do not apply to vessels southbound out of Swanson Channel.

MOVEMENT PROCEDURES

1. A VTS participant, if towing astern, do so with as short a hawser as safety and good seamanship permits.
2. A VTS participant of 100 meters or more in length (LOA) will make best efforts consistent with safety and industry practices:
 - a. Not to enter the Turn Point SOA when another VTS participant of 100 meters or more in length is already located within the SOA, unless;
 1. When following astern a minimum .5NM (5 cables) separation is maintained with the vessel ahead,

2. When overtaking in the SOA with the concurrence of MCTS Victoria that there is no opposing traffic and a CPA of at least .5NM (5 cables) is maintained,
 3. If outbound from Boundary Pass and meeting an inbound vessel from Haro Strait already in the SOA, enter only after the outbound vessel is past the vector heading of the inbound vessel engaged in the turn and maintain at least a .5NM (5 cables) CPA,
 4. If inbound from Haro Strait and meeting an outbound vessel from Boundary Pass already in the SOA, enter only after the outbound vessel has crossed a bearing line between Turn Point and Arachne Reef and maintain at least a .5NM (5 cables) CPA;
- b. Maintain a distance off of Turn Point of at least .3 NM (3 cables).

All VTS participants approaching the Turn Point SOA are expected to make safe passing arrangements with other VTS participants at either Monarch Head or Blunden Islet southbound; and Lime Kiln Light (LL222/US19695) or Kellett Bluff Light (LL229/US19720) northbound. These arrangements should be made no later than reaching CIP 6 at Gowlland Point (LL253/US19800) southbound and approximately abeam Danger Shoal Light and Horn Buoy (US19775) northbound.

➤ *If VTS Service is interrupted in my area, what should I do?*

In the event that Seattle Traffic experiences an emergency, and is forced to discontinue service, then VTS will attempt to restore service as soon as possible, possibly from an alternate location depending on the severity of the emergency. Vessels are requested to continue monitoring and reporting on the appropriate VTS frequency if VTS service is interrupted. Sail Plan, Position Report, and Final Reports shall be announced by the vessel operator in the VTS Puget Sound Area *regardless* if the call goes unanswered. This will provide a ‘vessel safety radio net’ for all. Vessels may also use the VTS frequency to make position reports on their progress for the safety of others while transiting the VTSPS Area. Tofino Traffic and Victoria Traffic have the capability to monitor and answer Channel 5A in the Strait of Juan de Fuca, and will answer calls made to “Seattle Traffic.” An emergency broadcast will be aired as a Broadcast Notice to Mariners, a Notice to Shipping, and will be made on all VTS frequencies and Channel 13 time permitting:

“All vessels in the VTS Area, this is Seattle Traffic. Traffic services will be discontinued until further notice due to emergency. VTS participants shall monitor the appropriate VTS frequency and broadcast required reports. This is Seattle Traffic, out.”

When service is restored, a radio announcement will be issued over the VTS frequencies and Channel 13.

Section 2

Title 33: Navigation and Navigable waters

PART 161—VESSEL TRAFFIC MANAGEMENT

Subpart A—Vessel Traffic Services

General Rules

- § 161.1 Purpose and Intent.
- § 161.2 Definitions.
- § 161.3 Applicability.
- § 161.4 Requirement to carry the rules.
- § 161.5 Deviations from the rules.
- § 161.6 Preemption.

Services, VTS Measures, and Operating Requirements

- § 161.10 Services.
- § 161.11 VTS measures.
- § 161.12 Vessel operating requirements.
- § 161.13 VTS Special Area operating requirements.

Subpart B—Vessel Movement Reporting System

- § 161.15 Purpose and intent.
- § 161.16 Applicability.
- § 161.17 Definitions.
- § 161.18 Reporting requirements.
- § 161.19 Sailing Plan (SP).
- § 161.20 Position Report (PR).
- § 161.21 Automated reporting.
- § 161.22 Final Report (FR).
- § 161.23 Reporting exemptions.

Subpart C—Vessel Traffic Service and Vessel Movement Reporting System Areas and Reporting Points

- § 161.55 Vessel Traffic Service Puget Sound and the Cooperative Vessel Traffic Service for the Juan de Fuca Region.

Subpart A—Vessel Traffic Services

General Rules

§ 161.1 Purpose and Intent.

(a) The purpose of this part is to promulgate regulations implementing and enforcing certain sections of the Ports and Waterways Safety Act (PWSA) setting up a national system of Vessel Traffic Services that will enhance navigation, vessel safety, and marine environmental protection, and promote safe vessel movement by reducing the potential for collisions, rammings, and groundings, and the loss of lives and property associated with these incidents within VTS areas established hereunder.

(b) Vessel Traffic Services provide the mariner with information related to the safe navigation of a waterway. This information, coupled with the mariner's compliance with the provisions set forth in this part, enhances the safe routing of vessels through congested waterways or waterways of particular hazard. Under certain circumstances, a VTS may issue directions to control the movement of vessels in order to minimize the risk of collision between vessels, or damage to property or the environment.

(c) The owner, operator, charterer, master, or person directing the movement of a vessel remains at all times responsible for the manner in which the vessel is operated and maneuvered, and is responsible for the safe navigation of the vessel under all circumstances. Compliance with these rules or with a direction of the VTS is at all times contingent upon the exigencies of safe navigation.

(d) Nothing in this part is intended to relieve any vessel, owner, operator, charterer, master, or person directing the movement of a vessel from the consequences of any neglect to comply with this part or any other applicable law or regulation (e.g., the International Regulations for Prevention of Collisions at Sea, 1972 (72 COLREGS) or the Inland Navigation Rules) or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

§ 161.2 Definitions.

For the purposes of this part:

Cooperative Vessel Traffic Services (CVTS) means the system of vessel traffic management established and jointly operated by the United States and Canada within adjoining waters. In addition, CVTS facilitates traffic movement and anchorages, avoids jurisdictional disputes, and renders assistance in emergencies in adjoining United States and Canadian waters.

Hazardous Vessel Operating Condition means any condition related to a vessel's ability to safely navigate or maneuver, and includes, but is not limited to:

(1) The absence or malfunction of vessel operating equipment, such as propulsion machinery, steering gear, radar system, gyrocompass, depth sounding device, automatic radar plotting aid

(ARPA), radiotelephone, Automatic Identification System equipment, navigational lighting, sound signaling devices or similar equipment.

(2) Any condition on board the vessel likely to impair navigation, such as lack of current nautical charts and publications, personnel shortage, or similar condition.

(3) Vessel characteristics that affect or restrict maneuverability, such as cargo or tow arrangement, trim, loaded condition, underkeel or overhead clearance, speed capabilities, power availability, or similar characteristics, which may affect the positive control or safe handling of the vessel or the tow.

Navigable waters means all navigable waters of the United States including the territorial sea of the United States, extending to 12 nautical miles from United States baselines, as described in Presidential Proclamation No. 5928 of December 27, 1988.

Precautionary Area means a routing measure comprising an area within defined limits where vessels must navigate with particular caution and within which the direction of traffic may be recommended.

Towing Vessel means any commercial vessel engaged in towing another vessel astern, alongside, or by pushing ahead.

Vessel Movement Center (VMC) means the shore-based facility that operates the vessel tracking system for a Vessel Movement Reporting System (VMRS) area or sector within such an area. The VMC does not necessarily have the capability or qualified personnel to interact with marine traffic, nor does it necessarily respond to traffic situations developing in the area, as does a Vessel Traffic Service (VTS).

Vessel Movement Reporting System (VMRS) means a mandatory reporting system used to monitor and track vessel movements. This is accomplished by a vessel providing information under established procedures as set forth in this part in the areas defined in Table 161.12(c) (VTS and VMRS Centers, Call Signs/MMSI, Designated Frequencies, and Monitoring Areas).

Vessel Movement Reporting System (VMRS) User means a vessel, or an owner, operator, charterer, Master, or person directing the movement of a vessel that is required to participate in a VMRS.

Vessel Traffic Center (VTC) means the shore-based facility that operates the vessel traffic service for the Vessel Traffic Service area or sector within such an area.

Vessel Traffic Services (VTS) means a service implemented by the United States Coast Guard designed to improve the safety and efficiency of vessel traffic and to protect the environment. The VTS has the capability to interact with marine traffic and respond to traffic situations developing in the VTS area.

Vessel Traffic Service Area or VTS Area means the geographical area encompassing a specific VTS area of service. This area of service may be subdivided into sectors for the purpose of

allocating responsibility to individual Vessel Traffic Centers or to identify different operating requirements.

Note: Although regulatory jurisdiction is limited to the navigable waters of the United States, certain vessels will be encouraged or may be required, as a condition of port entry, to report beyond this area to facilitate traffic management within the VTS area.

VTS Special Area means a waterway within a VTS area in which special operating requirements apply.

VTS User means a vessel, or an owner, operator, charterer, master, or person directing the movement of a vessel, that is:

- (a) Subject to the Vessel Bridge-to-Bridge Radiotelephone Act; or
- (b) Required to participate in a VMRS within a VTS area (VMRS User).

VTS User's Manual means the manual established and distributed by the VTS to provide the mariner with a description of the services offered and rules in force for that VTS. Additionally, the manual may include chartlets showing the area and sector boundaries, general navigational information about the area, and procedures, radio frequencies, reporting provisions and other information which may assist the mariner while in the VTS area.

§ 161.3 Applicability.

The provisions of this subpart shall apply to each VTS User and may also apply to any vessel while underway or at anchor on the navigable waters of the United States within a VTS area, to the extent the VTS considers necessary.

§ 161.4 Requirement to carry the rules.

Each VTS User shall carry on board and maintain for ready reference a copy of these rules.

Note: These rules are contained in the applicable U.S. Coast Pilot, the VTS User's Manual which may be obtained by contacting the appropriate VTS, and periodically published in the Local Notice to Mariners. The VTS User's Manual and the World VTS Guide, an International Maritime Organization (IMO) recognized publication, contain additional information which may assist the prudent mariner while in the appropriate VTS area.

§ 161.5 Deviations from the rules.

(a) Requests to deviate from any provision in this part, either for an extended period of time or if anticipated before the start of a transit, must be submitted in writing to the appropriate District Commander. Upon receipt of the written request, the District Commander may authorize a deviation if it is determined that such a deviation provides a level of safety equivalent to that provided by the required measure or is a maneuver considered necessary for safe navigation under the circumstances. An application for an authorized deviation must state the need and fully describe the proposed alternative to the required measure.

(b) Requests to deviate from any provision in this part due to circumstances that develop during a transit or immediately preceding a transit, may be made verbally to the appropriate VTS Director. Requests to deviate shall be made as far in advance as practicable. Upon receipt of the request, the VTS Director may authorize a deviation if it is determined that, based on vessel handling characteristics, traffic density, radar contacts, environmental conditions and other relevant information, such a deviation provides a level of safety equivalent to that provided by the required measure or is a maneuver considered necessary for safe navigation under the circumstances.

§ 161.6 Preemption.

The regulations in this part have preemptive impact over State laws or regulations on the same subject matter. The Coast Guard has determined, after considering the factors developed by the Supreme Court in *U.S. v. Locke*, 529 U.S. 89 (2000), that by enacting Chapter 25 of the Ports and Waterways Safety Act (33 U.S.C. 1221 *et seq.*), Congress intended that Coast Guard regulations preempt State laws or regulations regarding vessel traffic services in United States ports and waterways.

Services, VTS Measures, and Operating Requirements

§ 161.10 Services.

To enhance navigation and vessel safety, and to protect the marine environment, a VTS may issue advisories, or respond to vessel requests for information, on reported conditions within the VTS area, such as:

- (a) Hazardous conditions or circumstances;
- (b) Vessel congestion;
- (c) Traffic density;
- (d) Environmental conditions;
- (e) Aids to navigation status;
- (f) Anticipated vessel encounters;
- (g) Another vessel's name, type, position, hazardous vessel operating conditions, if applicable, and intended navigation movements, as reported;
- (h) Temporary measures in effect;
- (i) A description of local harbor operations and conditions, such as ferry routes, dredging, and so forth;
- (j) Anchorage availability; or

(k) Other information or special circumstances.

§ 161.11 VTS measures.

(a) A VTS may issue measures or directions to enhance navigation and vessel safety and to protect the marine environment, such as, but not limited to:

- (1) Designating temporary reporting points and procedures;
- (2) Imposing vessel operating requirements; or
- (3) Establishing vessel traffic routing schemes.

(b) During conditions of vessel congestion, restricted visibility, adverse weather, or other hazardous circumstances, a VTS may control, supervise, or otherwise manage traffic, by specifying times of entry, movement, or departure to, from, or within a VTS area.

§ 161.12 Vessel operating requirements.

(a) Subject to the exigencies of safe navigation, a VTS User shall comply with all measures established or directions issued by a VTS.

(b) If, in a specific circumstance, a VTS User is unable to safely comply with a measure or direction issued by the VTS, the VTS User may deviate only to the extent necessary to avoid endangering persons, property or the environment. The deviation shall be reported to the VTS as soon as is practicable.

(c) When not exchanging voice communications, a VTS User must maintain a listening watch as required by § 26.04(e) of this chapter on the VTS frequency designated in Table 161.12(c) (VTS and VMRS Centers, Call Signs/MMSI, Designated Frequencies, and Monitoring Areas). In addition, the VTS User must respond promptly when hailed and communicate in the English language.

Note to § 161.12(c): As stated in 47 CFR 80.148(b), a very high frequency watch on Channel 16 (156.800 MHz) is not required on vessels subject to the Vessel Bridge-to-Bridge Radiotelephone Act and participating in a Vessel Traffic Service (VTS) system when the watch is maintained on both the vessel bridge-to-bridge frequency and a designated VTS frequency.

It is requested that when anchored or moored to a buoy in the VTS Area, the master, pilot, or person directing the movement of the vessel ensure that a radio listening watch is maintained on the appropriate VTS frequency except when transmitting on that frequency. Additional anchoring standards of care are contained in the Puget Sound Harbor Safety Plan.

Table 161.12(c)—VTS and VMRS Centers, Call Signs/MMSI, Designated Frequencies, and Monitoring Areas

Center MMSI¹ Call Sign	Designated frequency (Channel designation)—purpose²	Monitoring area^{3,4}
Puget Sound ⁷		
<i>Seattle Traffic</i> — 003669957	156.700 MHz (Ch. 14)	The waters of Puget Sound, Hood Canal and adjacent waters south of a line connecting Nodule Point and Bush Point in Admiralty Inlet and south of a line drawn due east from the southernmost tip of Possession Point on Whidbey Island to the shoreline.
<i>Seattle Traffic</i> — 003669957	156.250 MHz (Ch. 5A)	The waters of the Strait of Juan de Fuca east of 124°40' W. excluding the waters in the central portion of the Strait of Juan de Fuca north and east of Race Rocks; the navigable waters of the Strait of Georgia east of 122°52' W.; the San Juan Island Archipelago, Rosario Strait, Bellingham Bay; Admiralty Inlet north of a line connecting Nodule Point and Bush Point and all waters east of Whidbey Island North of a line drawn due east from the southernmost tip of Possession Point on Whidbey Island to the shoreline.
<i>Tofino Traffic</i> — 003160012	156.725 MHz (Ch. 74)	The waters west of 124°40' W. within 50 nautical miles of the coast of Vancouver Island including the waters north of 48° N., and east of 127° W.
<i>Victoria Traffic</i> — 003160010	156.550 MHz (Ch. 11)	The waters of the Strait of Georgia west of 122°52' W., the navigable waters of the central Strait of Juan de Fuca north and east of Race Rocks, including the Gulf Island Archipelago, Boundary Pass and Haro Strait.

***A precise service ‘exchange line’ was adopted in 2010 between Tofino Traffic, Seattle Traffic and Victoria Traffic. The official exchange lines are defined as:**

- (a) Part 1. The 124°40' west meridian of Longitude in Juan de Fuca Strait from the Canadian low-water line to the U.S. low-water line as depicted on official charts;
- (b) Part 2. Church Point on Vancouver Island, to Race Rocks Light, due easterly to the intersection of the U.S./Canadian border at 48°17'53.0"N/123°14'6.0"W, north-easterly to Hein Bank in position 48°21'05.62"N/123°02'45.72"W, northerly to Cattle Point Light on San Juan Island, along the shoreline to Lime Kiln Light, to Kellett Bluff Light on Henry Island, along the shoreline to the tip of McCracken Point at the northernmost point of Henry Island, to the southernmost point on Stuart Island in position 48°39'28"N/123°11'05"W, along the shoreline to Turn Point Light, to Sandy Point on Waldron Island, along the shoreline to Point Hammond, to Patos Island Light, to Alden Bank in position 48°50'23.39"N/122°52'13.67"W, then due north to Boundary Bay in position 49°00'07.5"N/122°52'13.67"W, then due east along the international boundary to the shoreline in Semiahmoo Bay.

Notes:

¹ Maritime Mobile Service Identifier (MMSI) is a unique nine-digit number assigned that identifies ship stations, ship earth stations, coast stations, coast earth stations, and group calls for use by a digital selective calling (DSC) radio, an INMARSAT ship earth station or AIS. AIS requirements are set forth in §§ 161.21 and 164.46 of this subchapter. The requirements set forth in §§ 161.21 and 164.46 of this subchapter apply in those areas denoted with a MMSI number.

² In the event of a communication failure, difficulties or other safety factors, the Center may direct or permit a user to monitor and report on any other designated monitoring frequency or the bridge-to-bridge navigational frequency, 156.650 MHz (Channel 13) or 156.375 MHz (Ch. 67), to the extent that doing so provides a level of safety beyond that provided by other means. The bridge-to-bridge navigational frequency, 156.650 MHz (Ch. 13), is used in certain monitoring areas where the level of reporting does not warrant a designated frequency.

³ All geographic coordinates (latitude and longitude) are expressed in North American Datum of 1983 (NAD 83).

⁴ Some monitoring areas extend beyond navigable waters. Although not required, users are strongly encouraged to maintain a listening watch on the designated monitoring frequency in these areas. Otherwise, they are required to maintain watch as stated in 47 CFR 80.148.

⁵ N/A

⁶ N/A

⁷ A Cooperative Vessel Traffic Service was established by the United States and Canada within adjoining waters. The appropriate Center administers the rules issued by both nations; however, enforces only its own set of rules within its jurisdiction. Note, the bridge-to-bridge navigational frequency, 156.650 MHz (Ch. 13), is not so designated in Canadian waters, therefore users are encouraged and permitted to make passing arrangements on the designated monitoring frequencies.

(d) As soon as is practicable, a VTS User shall notify the VTS of any of the following:

- (1) A marine casualty as defined in 46 CFR 4.05-1;
- (2) Involvement in the ramming of a fixed or floating object;
- (3) A pollution incident as defined in § 151.15 of this chapter;
- (4) A defect or discrepancy in an aid to navigation;
- (5) A hazardous condition as defined in § 160.203 of this chapter;
- (6) Improper operation of vessel equipment required by part 164 of this chapter;

(7) A situation involving hazardous materials for which a report is required by 49 CFR 176.48; and

- (8) A hazardous vessel operating condition as defined in § 161.2.

The master, pilot, or person directing the movement of the vessel is also requested to report to the VTS any other hazardous condition or circumstance whenever observed unless it is

known to have been previously reported. These include, but are not limited to the following:

- (a) Reduced visibility and other adverse weather conditions**
- (b) Concentrations or vessels congesting the traffic lanes**
- (c) Floating logs or other obstructions to navigation**
- (d) Any defect observed on another vessel that may affect safe navigation**

§ 161.13 VTS Special Area operating requirements.

The following operating requirements apply within a VTS Special Area:

(a) A VTS User shall, if towing astern, do so with as short a hawser as safety and good seamanship permits.

(b) A VMRS User shall:

(1) Not enter or get underway in the area without prior approval of the VTS;

(2) Not enter a VTS Special Area if a hazardous vessel operating condition or circumstance exists;

(3) Not meet, cross, or overtake any other VMRS User in the area without prior approval of the VTS; and

(4) Before meeting, crossing, or overtaking any other VMRS User in the area, communicate on the designated vessel bridge-to-bridge radiotelephone frequency, intended navigation movements, and any other information necessary in order to make safe passing arrangements. This requirement does not relieve a vessel of any duty prescribed by the International Regulations for Prevention of Collisions at Sea, 1972 (72 COLREGS) or the Inland Navigation Rules.

Subpart B—Vessel Movement Reporting System

§ 161.15 Purpose and intent.

(a) A Vessel Movement Reporting System (VMRS) is a system used to monitor and track vessel movements within a VTS or VMRS area. This is accomplished by requiring that vessels provide information under established procedures as set forth in this part, or as directed by the Center.

(b) To avoid imposing an undue reporting burden or unduly congesting radiotelephone frequencies, reports shall be limited to information which is essential to achieve the objectives of the VMRS. These reports are consolidated into three reports (sailing plan, position, and final).

§ 161.16 Applicability.

Unless otherwise stated, the provisions of this subpart apply to the following vessels and VMRS Users:

(a) Every power-driven vessel of 40 meters (approximately 131 feet) or more in length, while navigating;

(b) Every towing vessel of 8 meters (approximately 26 feet) or more in length, while navigating; or

(c) Every vessel certificated to carry 50 or more passengers for hire, when engaged in trade.

§ 161.17 Definitions.

As used in this subpart:

Center means a Vessel Traffic Center or Vessel Movement Center.

Published means available in a widely-distributed and publicly available medium (e.g., VTS User's Manual, ferry schedule, Notice to Mariners).

§ 161.18 Reporting requirements.

(a) A Center may:

(1) Direct a vessel to provide any of the information set forth in Table 161.18(a) (IMO Standard Ship Reporting System);

(2) Establish other means of reporting for those vessels unable to report on the designated frequency; or

(3) Require reports from a vessel in sufficient time to allow advance vessel traffic planning.

Table 161.18(a)—The IMO Standard Ship Reporting System

A	ALPHA	Ship	Name, call sign or ship station identity, and flag.
B	BRAVO	Dates and time of event	A 6 digit group giving day of month (first two digits), hours and minutes (last four digits). If other than UTC state time zone used.
C	CHARLIE	Position	A 4 digit group giving latitude in degrees and minutes suffixed with N (north) or S (south) and a 5 digit group giving longitude in degrees and minutes suffixed with E (east) or W (west); or.
D	DELTA	Position	True bearing (first 3 digits) and distance (state distance) in nautical miles from a clearly identified landmark (state landmark).
E	ECHO	True course	A 3 digit group.
F	FOXTROT	Speed in knots and tenths of knots	A 3 digit group.
G	GOLF	Port of Departure	Name of last port of call.
H	HOTEL	Date, time and point of entry system	Entry time expressed as in (B) and into the entry position expressed as in (C) or (D).
I	INDIA	Destination and expected time of arrival	Name of port and date time group expressed as in (B).
J	JULIET	Pilot	State whether a deep sea or local pilot is on board.
K	KILO	Date, time and point of exit from system	Exit time expressed as in (B) and exit position expressed as in (C) or (D).
L	LIMA	Route information	Intended track.
M	MIKE	Radio	State in full names of communications stations/frequencies guarded.
N	NOVEMBER	Time of next report	Date time group expressed as in (B).
O	OSCAR	Maximum present static draught in meters	4 digit group giving meters and centimeters.
P	PAPA	Cargo on board	Cargo and brief details of any dangerous cargoes as well as harmful substances and gases that could endanger persons or the environment.
Q	QUEBEC	Defects, damage, deficiencies or limitations	Brief detail of defects, damage, deficiencies or other limitations.
R	ROMEO	Description of pollution or dangerous goods lost	Brief details of type of pollution (oil, chemicals, etc) or dangerous goods lost overboard; position expressed as in (C) or (D).
S	SIERRA	Weather conditions	Brief details of weather and sea conditions prevailing.
T	TANGO	Ship's representative and/or owner	Details of name and particulars of ship's representative and/or owner for provision of information.
U	UNIFORM	Ship size and type	Details of length, breadth, tonnage, and type, etc., as required.
V	VICTOR	Medical personnel	Doctor, physician's assistant, nurse, no medic.
W	WHISKEY	Total number of persons on board	State number.
X	XRAY	Miscellaneous	Any other information as appropriate. [<i>i.e.</i> , a detailed description of a planned operation, which may include: its duration; effective area; any restrictions to navigation; notification procedures for approaching vessels; in addition, for a towing operation: configuration, length of the tow, available horsepower, etc.; for a dredge or floating plant: configuration of pipeline, mooring configuration, number of assist vessels, etc.].

(b) All reports required by this part shall be made as soon as is practicable on the frequency designated in Table 161.12(c) (VTS and VMRS Centers, Call Signs/MMSI, Designated Frequencies, and Monitoring Areas).

(c) When not exchanging communications, a VMRS User must maintain a listening watch as described in § 26.04(e) of this chapter on the frequency designated in Table 161.12(c) (VTS and VMRS Centers, Call Signs/MMSI, Designated Frequencies, and Monitoring Areas). In addition, the VMRS User must respond promptly when hailed and communicate in the English language.

Note: As stated in 47 CFR 80.148(b), a VHF watch on Channel 16 (156.800 MHz) is not required on vessels subject to the Vessel Bridge-to-Bridge Radiotelephone Act and participating in a Vessel Traffic Service (VTS) system when the watch is maintained on both the vessel bridge-to-bridge frequency and a designated VTS frequency.

(d) A vessel must report:

(1) Any significant deviation from its Sailing Plan, as defined in § 161.19, or from previously reported information; or

(2) Any intention to deviate from a VTS issued measure or vessel traffic routing system.

(e) When reports required by this part include time information, such information shall be given using the local time zone in effect and the 24-hour military clock system.

§ 161.19 Sailing Plan (SP).

Unless otherwise stated, at least 15 minutes, **but not more than 45 minutes**, before navigating a VTS area, a vessel must report the:

(a) Vessel name and type;

(b) Position;

(c) Destination and ETA;

(d) Intended route;

(e) Time and point of entry; and

(f) Dangerous cargo on board or in its tow, as defined in § 160.203 of this chapter, and other required information as set out in § 160.211 and § 160.213 of this chapter, if applicable.

§ 161.20 Position Report (PR).

A vessel must report its name and position:

(a) Upon point of entry into a VMRS area;

(b) At designated reporting points as set forth in subpart C; or

(c) When directed by the Center.

§ 161.21 Automated reporting.

(a) Unless otherwise directed, vessels equipped with an Automatic Identification System (AIS) are required to make continuous, all stations, AIS broadcasts, in lieu of voice Position Reports, to those Centers denoted in Table 161.12(c) of this part.

(b) Should an AIS become non-operational, while or prior to navigating a VMRS area, it should be restored to operating condition as soon as possible, and, until restored a vessel must:

(1) Notify the Center;

(2) Make voice radio Position Reports at designated reporting points as required by § 161.20(b) of this part; and

(3) Make any other reports as directed by the Center.

Automated reporting does not relieve the vessel operator from the responsibility of submitting a Sail Plan. VTS requests all Class A AIS equipped vessels (particularly life tugs) broadcast AIS while temporarily moored or at anchor so they can be identified in an emergency.

§ 161.22 Final Report (FR).

A vessel must report its name and position:

(a) On arrival at its destination; or

(b) When leaving a VTS area.

§ 161.23 Reporting exemptions.

(a) Unless otherwise directed, the following vessels are exempted from providing Position and Final Reports due to the nature of their operation:

(1) Vessels on a published schedule and route;

(2) Vessels operating within an area of a radius of three nautical miles or less; or

(3) Vessels escorting another vessel or assisting another vessel in maneuvering procedures.

(b) A vessel described in paragraph (a) of this section must:

(1) Provide a Sailing Plan at least 5 minutes but not more than 15 minutes before navigating within the VMRS area; and

(2) If it departs from its promulgated schedule by more than 15 minutes or changes its limited operating area, make the established VMRS reports, or report as directed.

Subpart C—Vessel Traffic Service and Vessel Movement Reporting System Areas and Reporting Points

Note: All geographic coordinates contained in part 161 (latitude and longitude) are expressed in North American Datum of 1983 (NAD 83).

§ 161.55 Vessel Traffic Service Puget Sound and the Cooperative Vessel Traffic Service for the Juan de Fuca Region.

The Vessel Traffic Service Puget Sound area consists of the navigable waters of the United States bounded by a line drawn from the Washington State coastline at 48°23'08" N., 124°43'37" W. on Cape Flattery to the Cape Flattery Light at 48°23'30" N., 124°44'12" W. on Tatoosh Island, due west to the U.S. Territorial Sea Boundary; thence northward along the U.S. Territorial Sea Boundary to its intersection with the U.S./Canada International Boundary; thence east along the U.S./Canada International Boundary through the waters known as the Strait of Juan de Fuca, Haro Strait, Boundary Pass, and the Strait of Georgia to the Washington State coastline at 49°00'06" N., 122°45'18" W. (International Boundary Range C Rear Light). This area includes: Puget Sound, Hood Canal, Possession Sound, the San Juan Island Archipelago, Rosario Strait, Guemes Channel, Bellingham Bay, the U.S. waters of the Strait of Juan de Fuca and the Strait of Georgia, and all waters adjacent to the above.

(a) Vessel Traffic Service Puget Sound participates in a U.S./Canadian Cooperative Vessel Traffic Service (CVTS) to jointly manage vessel traffic in the Juan de Fuca Region. The CVTS for the Juan de Fuca Region consists of all waters of the Strait of Juan de Fuca and its offshore approaches, southern Georgia Strait, the Gulf and San Juan Archipelagos, Rosario Strait, Boundary Pass and Haro Strait, bounded on the northwest by 48°35'45" N.; and on the southwest by 48°23'30" N.; and on the west by the rhumb line joining 48°35'45" N., 124°47'30" W. with 48°23'30" N., 124°48'37" W.; and on the northeast in the Strait of Georgia, by a line drawn along 49° N. from Vancouver Island to Semiahmoo Bay; and on the southeast, by a line drawn from McCurdy Point on the Quimper Peninsula to Point Partridge on Whidbey Island. Canadian and United States Vessel Traffic Centers (Tofino, B.C., Canada, Vancouver, BC, Canada and Seattle, WA) manage traffic within the CVTS area irrespective of the International Boundary.

(b) VTS Special Areas.

(1) The Rosario Strait VTS Special Area consists of those waters bounded to the south by the center of Precautionary Area "RB" (a circular area of 2,500 yards radius centered at 48°26'24" N., 122°45'12" W.), and to the north by the center of Precautionary Area "C" (a circular area of 2,500 yards radius centered at 48°40'34" N., 122°42'44" W.; Lighted Buoy "C"); and

Note: The center of precautionary area "RB" is not marked by a buoy. All precautionary areas are depicted on National Oceanic and Atmospheric Administration (NOAA) nautical charts.

(2) The Guemes Channel VTS Special Area consists of those waters bounded to the west by Shannon Point on Fidalgo Island and to the east by Southeast Point on Guemes Island.

As a matter of VTS policy, Bellingham Channel and the Saddlebag Route are treated as being part of the above VTS Special Areas and are in the process of being formally included via regulatory action.

(c) Additional VTS Special Area Operating Requirements. The following additional requirements are applicable in the Rosario Strait and Guemes Channel VTS Special Areas:

(1) A vessel engaged in towing shall not impede the passage of a vessel of 40,000 dead weight tons or more.

(2) A vessel of less than 40,000 dead weight tons is exempt from the provision set forth in § 161.13(b)(1) of this part.

(3) A vessel of less than 100 meters in length is exempt from the provisions set forth in § 161.13(b)(3) of this part. Approval will not be granted for:

(i) A vessel of 100 meters or more in length to meet or overtake; or cross or operate within 2,000 yards (except when crossing astern) of a vessel of 40,000 dead weight tons or more; or

(ii) A vessel of 40,000 dead weight tons or more to meet or overtake; or cross or operate within 2,000 yards (except when crossing astern) of a vessel of 100 meters or more in length.

(d) Reporting Point. Inbound vessels in the Strait of Juan de Fuca upon crossing 124-W.

Section 3

Title 33: Navigation and Navigable waters

EXCERPTS FROM VARIOUS PARTS OF 33 CFR

PART 1--GENERAL PROVISIONS

§ 1.01-30 Captains of the Port.

Captains of the Port and their representatives enforce within their respective areas port safety and security and marine environmental protection regulations, including, without limitation, regulations for the protection and security of vessels, harbors, and waterfront facilities; anchorages; security zones; safety zones; regulated navigation areas; deepwater ports; water pollution; and ports and waterways safety.

PART 26--VESSEL BRIDGE-TO-BRIDGE RADIOTELEPHONE REGULATIONS

§ 26.01 Purpose.

(a) The purpose of this part is to implement the provisions of the Vessel Bridge-to-Bridge Radiotelephone Act. This part:

- (1) Requires the use of the vessel bridge-to-bridge radiotelephone;
- (2) Provides the Coast Guard's interpretation of the meaning of important terms in the Act;
- (3) Prescribes the procedures for applying for an exemption from the Act and the regulations issued under the Act and a listing of exemptions.

(b) Nothing in this part relieves any person from the obligation of complying with the rules of the road and the applicable pilot rules.

§ 26.02 Definitions.

For the purpose of this part and interpreting the Act:

Act means the "Vessel Bridge-to-Bridge Radiotelephone Act", 33 U.S.C. sections 1201-1208;

Length is measured from end to end over the deck excluding sheer;

Power-driven vessel means any vessel propelled by machinery; and

Secretary means the Secretary of the Department in which the Coast Guard is operating;

Territorial sea means all waters as defined in § 2.22(a)(1) of this chapter.

Towing vessel means any commercial vessel engaged in towing another vessel astern, alongside, or by pushing ahead.

Vessel Traffic Services (VTS) means a service implemented under Part 161 of this chapter by the United States Coast Guard designed to improve the safety and efficiency of vessel traffic and to protect the environment. The VTS has the capability to interact with marine traffic and respond to traffic situations developing in the VTS area.

Vessel Traffic Service Area or VTS Area means the geographical area encompassing a specific VTS area of service as described in Part 161 of this chapter. This area of service may be subdivided into sectors for the purpose of allocating responsibility to individual Vessel Traffic Centers or to identify different operating requirements.

Note: Although regulatory jurisdiction is limited to the navigable waters of the United States, certain vessels will be encouraged or may be required, as a condition of port entry, to report beyond this area to facilitate traffic management within the VTS area.

§ 26.03 Radiotelephone required.

(a) Unless an exemption is granted under § 26.09 and except as provided in paragraph (a)(4) of this section, this part applies to:

- (1) Every power-driven vessel of 20 meters or over in length while navigating;
- (2) Every vessel of 100 gross tons and upward carrying one or more passengers for hire while navigating;
- (3) Every towing vessel of 26 feet or over in length while navigating; and
- (4) Every dredge and floating plant engaged in or near a channel or fairway in operations likely to restrict or affect navigation of other vessels except for an unmanned or intermittently manned floating plant under the control of a dredge.

(b) Every vessel, dredge, or floating plant described in paragraph (a) of this section must have a radiotelephone on board capable of operation from its navigational bridge, or in the case of a dredge, from its main control station, and capable of transmitting and receiving on the frequency or frequencies within the 156-162 Mega-Hertz band using the classes of emissions designated by the Federal Communications Commission for the exchange of navigational information.

(c) The radiotelephone required by paragraph (b) of this section must be carried on board the described vessels, dredges, and floating plants upon the navigable waters of the United States.

(d) The radiotelephone required by paragraph (b) of this section must be capable of transmitting and receiving on VHF FM channel 22A (157.1 MHz).

(e) N/A

(f) In addition to the radiotelephone required by paragraph (b) of this section, each vessel described in paragraph (a) of this section while transiting any waters within a Vessel Traffic Service Area, must have on board a radiotelephone capable of transmitting and receiving on the VTS designated frequency in Table 161.12(c) (VTS and VMRS Centers, Call Signs/MMSI, Designated Frequencies, and Monitoring Areas).

Note: A single VHF-FM radio capable of scanning or sequential monitoring (often referred to as “dual watch” capability) will not meet the requirements for two radios.

§ 26.04 Use of the designated frequency.

(a) No person may use the frequency designated by the Federal Communications Commission under section 8 of the Act, 33 U.S.C. 1207(a), to transmit any information other than information necessary for the safe navigation of vessels or necessary tests.

(b) Each person who is required to maintain a listening watch under section 5 of the Act shall, when necessary, transmit and confirm, on the designated frequency, the intentions of his vessel and any other information necessary for the safe navigation of vessels.

(c) Nothing in these regulations may be construed as prohibiting the use of the designated frequency to communicate with shore stations to obtain or furnish information necessary for the safe navigation of vessels.

(d) On the navigable waters of the United States, channel 13 (156.65 MHz) is the designated frequency required to be monitored in accordance with § 26.05(a) except that in the area prescribed in § 26.03(e), channel 67 (156.375 MHz) is the designated frequency.

(e) On those navigable waters of the United States within a VTS area, the designated VTS frequency is an additional designated frequency required to be monitored in accordance with § 26.05.

§ 26.05 Use of radiotelephone.

Section 5 of the Act states that the radiotelephone required by this Act is for the exclusive use of the master or person in charge of the vessel, or the person designated by the master or person in charge to pilot or direct the movement of the vessel, who shall maintain a listening watch on the designated frequency. Nothing herein shall be interpreted as precluding the use of portable radiotelephone equipment to satisfy the requirements of this act.

§ 26.06 Maintenance of radiotelephone; failure of radiotelephone.

Section 6 of the Act states:

(a) Whenever radiotelephone capability is required by this Act, a vessel's radiotelephone equipment shall be maintained in effective operating condition. If the radiotelephone equipment carried aboard a vessel ceases to operate, the master shall exercise due diligence to restore it or cause it to be restored to effective operating condition at the earliest practicable time. The failure of a vessel's radiotelephone equipment shall not, in itself, constitute a violation of this Act, nor shall it obligate the master of any vessel to moor or anchor his vessel; however, the loss of radiotelephone capability shall be given consideration in the navigation of the vessel.

§ 26.07 Communications.

No person may use the services of, and no person may serve as, a person required to maintain a listening watch under section 5 of the Act, 33 U.S.C. 1204, unless the person can communicate in the English language.

§ 26.08 Exemption procedures.

(a) The Commandant has redelegated to the Assistant Commandant for Marine Safety, Security and Environmental Protection, U.S. Coast Guard Headquarters, with the reservation that this authority shall not be further redelegated, the authority to grant exemptions from provisions of the Vessel Bridge-to-Bridge Radiotelephone Act and this part.

(b) Any person may petition for an exemption from any provision of the Act or this part;

(c) Each petition must be submitted in writing to U.S. Coast Guard, Marine Safety, Security and Environmental Protection, (CG-5), 2100 2nd St., SW., Stop 7355, Washington, DC 20593-7355, and must state:

(1) The provisions of the Act or this part from which an exemption is requested; and

(2) The reasons why marine navigation will not be adversely affected if the exemption is granted and if the exemption relates to a local communication system how that system would fully comply with the intent of the concept of the Act but would not conform in detail if the exemption is granted.

PART 80—COLREGS DEMARCATION LINES

§ 80.1385 Strait of Juan de Fuca.

The 72 COLREGS shall apply on all waters of the Strait of Juan de Fuca.

§ 80.1390 Haro Strait and Strait of Georgia.

The 72 COLREGS shall apply on all waters of the Haro Strait and the Strait of Georgia.

§ 80.1395 Puget Sound and adjacent waters.

The 72 COLREGS shall apply on all waters of Puget Sound and adjacent waters, including Lake Union, Lake Washington, Hood Canal, and all tributaries.

PART 160—PORTS AND WATERWAYS SAFETY—GENERAL

§ 160.3 Definitions.

For the purposes of this subchapter:

Bulk means material in any quantity that is shipped, stored, or handled without the benefit of package, label, mark or count and carried in integral or fixed independent tanks.

Captain of the Port means the Coast Guard officer designated by the Commandant to command a Captain of the Port Zone as described in part 3 of this chapter.

Commandant means the Commandant of the United States Coast Guard.

Deviation means any departure from any rule in this subchapter.

Director, Vessel Traffic Services means the Coast Guard officer designated by the Commandant to command a Vessel Traffic Service (VTS) as described in part 161 of this chapter.

District Commander means the Coast Guard officer designated by the Commandant to command a Coast Guard District as described in part 3 of this chapter.

ETA means estimated time of arrival.

Length of Tow means, when towing with a hawser, the length in feet from the stern of the towing vessel to the stern of the last vessel in tow. When pushing ahead or towing alongside, length of tow means the tandem length in feet of the vessels in tow excluding the length of the towing vessel.

Person means an individual, firm, corporation, association, partnership, or governmental entity.

State means each of the several States of the United States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the United States Virgin Islands, the Trust Territories of the Pacific Islands, the Commonwealth of the Northern Marianas Islands, and any other commonwealth, territory, or possession of the United States.

Tanker means a self-propelled tank vessel constructed or adapted primarily to carry oil or hazardous materials in bulk in the cargo spaces.

Tank Vessel means a vessel that is constructed or adapted to carry, or that carries, oil or hazardous material in bulk as cargo or cargo residue.

Vehicle means every type of conveyance capable of being used as a means of transportation on land.

Vessel means every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water.

Vessel Traffic Services (VTS) means a service implemented under part 161 of this chapter by the United States Coast Guard designed to improve the safety and efficiency of vessel traffic and to protect the environment. The VTS has the capability to interact with marine traffic and respond to traffic situations developing in the VTS area.

Vessel Traffic Service Area or VTS Area means the geographical area encompassing a specific VTS area of service as described in part 161 of this chapter. This area of service may be subdivided into sectors for the purpose of allocating responsibility to individual Vessel Traffic Centers or to identify different operating requirements.

Note: Although regulatory jurisdiction is limited to the navigable waters of the United States, certain vessels will be encouraged or may be required, as a condition of port entry, to report beyond this area to facilitate traffic management within the VTS area.

VTS Special Area means a waterway within a VTS area in which special operating requirements apply.

§ 160.5 Delegations.

(a) District Commanders and Captains of the Ports are delegated the authority to establish safety zones.

(b) Under the provisions of §§ 6.04-1 and 6.04-6 of this chapter, District Commanders and Captains of the Ports have been delegated authority to establish security zones.

(c) Under the provisions of § 1.05-1 of this chapter, District Commanders have been delegated authority to establish regulated navigation areas.

(d) Subject to the supervision of the cognizant Captain of the Port and District Commander, Directors, Vessel Traffic Services are delegated authority under 33 CFR 1.01-30 to discharge the duties of the Captain of the Port that involve directing the operation, movement, and anchorage of vessels within a Vessel Traffic Service area including management of vessel traffic within anchorages, regulated navigation areas and safety zones, and to enforce Vessel Traffic Service and ports and waterways safety regulations. This authority may be exercised by Vessel Traffic Center personnel. The Vessel Traffic Center may, within the Vessel Traffic Service area, provide information, make recommendations, or, to a vessel required under part 161 of this chapter to participate in a Vessel Traffic Service, issue an order, including an order to operate or anchor as directed; require the vessel to comply with orders issued; specify times of entry, movement or departure; restrict operations as necessary for safe operation under the circumstances; or take other action necessary for control of the vessel and the safety of the port or of the marine environment.

PART 165—REGULATED NAVIGATION AREAS AND LIMITED ACCESS AREAS

Subpart B—Regulated Navigation Areas

§ 165.10 Regulated navigation areas.

§ 165.11 Vessel operating requirements (regulations).

§ 165.13 General regulations.

Subpart C—Safety Zones

§ 165.20 Safety zones.

§ 165.23 General regulations.

Subpart D—Security Zones

§ 165.30 Security zones.

§ 165.33 General regulations.

Subpart E—Restricted Waterfront Areas

§ 165.40 Restricted waterfront areas.

Subpart F—Specific Regulated Navigation Areas and Limited Access Areas

Thirteenth Coast Guard District

- § 165.1301 Puget Sound and Adjacent Waters in Northwestern Washington—Regulated Navigation Area.
- § 165.1302 Bangor Naval Submarine Base, Bangor, WA.
- § 165.1303 Puget Sound and adjacent waters, WA—regulated navigation area.
- § 165.1304 Bellingham Bay, Bellingham, WA.
- § 165.1305 Commencement Bay, Tacoma, WA.
- § 165.1307 Elliott Bay, Seattle, WA.
- § 165.1309 Eagle Harbor, Bainbridge Island, WA.
- § 165.1310 Strait of Juan de Fuca and adjacent coastal waters of Northwest Washington; Makah Whale Hunting—Regulated Navigation Area.
- § 165.1311 Olympic View Resource Area, Tacoma, WA.
- § 165.1313 Security zone regulations, tank ship protection, Puget Sound and adjacent waters, Washington
- § 165.1317 Security and Safety Zone; Large Passenger Vessel Protection, Puget Sound and adjacent waters, Washington.
- § 165.1319 Safety Zone Regulations, Seafair Blue Angels Air Show Performance, Seattle, WA.
- § 165.1321 Security Zone; Protection of Military Cargo, Captain of the Port Zone Puget Sound, WA.
- § 165.1324 Safety and Security Zone; Cruise Ship Protection, Elliott Bay and Pier-91, Seattle, Washington.
- § 165.1327 Security Zone; escorted U.S. Navy submarines in Sector [Puget Sound] Captain of the Port Zone.
- § 165.1328 Regulated Navigation Area; U.S. Navy submarines, Hood Canal, WA.
- § 165.1329 Regulated Navigation Area; Thea Foss and Wheeler-Osgood Waterways EPA Superfund Cleanup Site, Commencement Bay, Tacoma, WA.
- § 165.1330 Safety Zone; Fleet Week Maritime Festival, Pier 66, Elliott Bay, Seattle, WA.
- § 165.1332 Safety Zones; annual firework displays within the Captain of the Port, Puget Sound Area of Responsibility.
- § 165.1333 Security Zones, Seattle’s Seafair Fleet Week moving vessels, Puget Sound, WA.
- § 165.1334 Security Zone; U.S. Coast Guard BSU Seattle, Pier 36, Elliott Bay, Seattle, WA.
- § 165.1336 Regulated Navigation Area; Pacific Sound Resources and Lockheed Shipyard Superfund Sites, Elliott Bay, Seattle, WA.
- § 165.1339 Safety Zone; Coast Guard Exercise Area, Hood Canal, Washington.

Subpart G—Protection of Naval Vessels

- § 165.2010 Purpose
- § 165.2015 Definitions
- § 165.2020 Enforcement Authority
- § 165.2030 Pacific Area

Subpart B—Regulated Navigation Areas

§165.10 Regulated navigation areas.

A regulated navigation area is a water area within a defined boundary for which regulations for vessels navigating within the area have been established under this part.

§165.11 Vessel operating requirements (regulations).

Each District Commander may control vessel traffic in an area which is determined to have hazardous conditions, by issuing regulations:

- (a) Specifying times of vessel entry, movement, or departure to, from, within, or through ports, harbors, or other waters;
- (b) Establishing vessel size, speed, draft limitations, and operating conditions; and
- (c) Restricting vessel operation, in a hazardous area or under hazardous conditions, to vessels which have particular operating characteristics or capabilities which are considered necessary for safe operation under the circumstances.

§165.13 General regulations.

- (a) The master of a vessel in a regulated navigation area shall operate the vessel in accordance with the regulations contained in Subpart F.
- (b) No person may cause or authorize the operation of a vessel in a regulated navigation area contrary to the regulations in this part.

Subpart C—Safety Zones

§165.20 Safety zones.

A Safety Zone is a water area, shore area, or water and shore area to which, for safety or environmental purposes, access is limited to authorized persons, vehicles, or vessels. It may be stationary and described by fixed limits or it may be described as a zone around a vessel in motion.

§165.23 General regulations.

Unless otherwise provided in this part:

- (a) No person may enter a safety zone unless authorized by the COTP or the District Commander;
- (b) No person may bring or cause to be brought into a safety zone any vehicle, vessel, or object unless authorized by the COTP or the District Commander;
- (c) No person may remain in a safety zone or allow any vehicle, vessel, or object to remain in a safety zone unless authorized by the COTP or the District Commander; and

- (d) Each person in a safety zone who has notice of a lawful order or direction shall obey the order or direction of the COTP or District Commander issued to carry out the purposes of this subpart.

Subpart D—Security Zones

§165.30 Security zones.

- (a) A security zone is an area of land, water, or land and water which is so designated by the Captain of the Port or District Commander for such time as is necessary to prevent damage or injury to any vessel or waterfront facility, to safeguard ports, harbors, territories, or waters of the United States or to secure the observance of the rights and obligations of the United States.
- (b) The purpose of a security zone is to safeguard from destruction, loss, or injury from sabotage or other subversive acts, accidents, or other causes of a similar nature:
 - (1) Vessels,
 - (2) Harbors,
 - (3) Ports, and
 - (4) Waterfront facilities:

in the United States and all territory and water, continental or insular, that is subject to the jurisdiction of the United States.

§165.33 General regulations.

Unless otherwise provided in the special regulations in Subpart F of this part:

- (a) No person or vessel may enter or remain in a security zone without the permission of the Captain of the Port;
- (b) Each person and vessel in a security zone shall obey any direction or order of the Captain of the Port;
- (c) The Captain of the Port may take possession and control of any vessel in the security zone;
- (d) The Captain of the Port may remove any person, vessel, article, or thing from a security zone;
- (e) No person may board, or take or place any article or thing on board, any vessel in a security zone without the permission of the Captain of the Port; and
- (f) No person may take or place any article or thing upon any waterfront facility in a security zone without the permission of the Captain of the Port.

Subpart E—Restricted Waterfront Areas

§165.40 Restricted waterfront areas.

The Commandant may direct the COTP to prevent access to waterfront facilities, and port and harbor areas, including vessels and harbor craft therein. This section may apply to persons who do not possess the credentials outlined in §125.09 of this chapter when certain shipping activities are conducted that are outlined in §125.15 of this chapter.

Subpart F—Specific Regulated Navigation Areas and Limited Access Areas

Thirteenth Coast Guard District

§ 165.1301 Puget Sound and Adjacent Waters in Northwestern Washington—Regulated Navigation Area.

The following is a regulated navigation area—All of the following northwestern Washington waters under the jurisdiction of the Captain of the Port, Puget Sound: Puget Sound, Hood Canal, Possession Sound, Elliott Bay, Commencement Bay, the San Juan Archipelago, Rosario Strait, Guemes Channel, Bellingham Bay, U.S. waters of the Strait of the Strait of Juan de Fuca, Haro Strait, Boundary Pass, and Georgia Strait, and all lesser bays and harbors adjacent to the above.

(a) Definitions as used in this section:

- (1) *Vessels engaged in fishing* are as identified in the definition found in Rule 3 of the International Regulations for Prevention of Collisions at Sea, 1972, (72 COLREGS), found in Appendix A, Part 81 of this chapter.
- (2) *Hazardous levels of vessel traffic congestion* are as defined at the time by Vessel Traffic Service Puget Sound.

(b) Nothing in this section shall be construed as relieving any party from their responsibility to comply with applicable rules set forth in the 72 COLREGS.

(c) General Regulations: The provisions of this paragraph apply at all times.

- (1) Vessels engaged in fishing or other operations—that are distinct from vessels following a TSS or a connecting precautionary area east of New Dungeness and which are not required by the Bridge to Bridge Radiotelephone Regulations to maintain a listening watch, are highly encouraged to maintain a listening watch on the Vessel Traffic Service Puget Sound (PSVTS) VHF-FM radio frequency for the area in which the vessel is operating. A safe alternative to the radio listening watch is to stay clear of the TSS and connecting precautionary area.
- (2) Vessels engaged in gill net fishing at any time between sunset and sunrise in any of the waters defining the regulated navigation area of this section shall, in addition to the navigation lights and shapes required by Part 81 of this title (72 COLREGS), display at the end of the net most distant from the vessel on all-round (32-point) white light visible for a minimum of two nautical miles and displayed from at least three feet above the surface of the water.

- (3) Vessels engaged in fishing, including gillnet and purse seine fishing, are prohibited in the following Prohibited Fishing Area: The Hood Canal Bridge, to include the waters within a one-half nautical mile radius of the center of the main ship channel draw span during the immediate approach and transit of the draw by public vessels of the United States.
 - (4) East of New Dungeness, vessels engaged in fishing in a traffic lane or connecting precautionary area shall tend nets or other gear placed in the water so as to facilitate the movement of the vessel or gear from the traffic lane or precautionary area upon the approach of a vessel following the TSS.
- (d) Congested Regulations: The provisions under this paragraph apply only when imposed in specific locations by Vessel Traffic Service Puget Sound. They are intended to enhance vessel traffic safety during periods and in locations where hazardous levels of vessel traffic congestion are deemed to exist by Vessel Traffic Service Puget Sound. Operations potentially creating vessel traffic congestion include, but are not limited to, vessels engaged in fishing, including gillnet or purse seine, recreational fishing derbies, regattas, or permitted marine events.
- (1) Vessels engaged in fishing or other operations—that are distinct from vessels following a Traffic Separation Scheme (TSS) or a connecting precautionary area east of New Dungeness, may not remain in, nor their gear remain in, a traffic lane or a connecting precautionary area east of New Dungeness when a vessel following a TSS approaches. Such vessels not following a TSS or a connecting precautionary area shall draw in their gear, maneuver, or otherwise clear these areas so that their action is complete at least fifteen minutes before the arrival of a vessel following the TSS. Vessels which are required by this paragraph to remain clear of a connecting precautionary area east of New Dungeness or a traffic lane must also remain clear of the adjacent separation zone when in a TSS east of New Dungeness.
 - (2) A vessel following the TSS may not exceed a speed of 11 knots through the water.
 - (3) Vessels engaged in fishing, including gillnet and purse seine fishing, are prohibited in the following Prohibited Fishing Area: Edmonds/Kingston ferry crossing lanes, to include the waters within one-quarter nautical mile on either side of a straight line connecting the Edmonds and Kingston ferry landings during the hours that the ferry is operating.
- (e) Authorization to deviate from this section.
- (1) Commander, Thirteenth Coast Guard District may, upon written request, issue an authorization to deviate from this section if the proposed deviation provides a level of safety equivalent to or beyond that provided by the required procedure. An application for authorization must state the need for the deviation and describe the proposed alternative operation.
 - (2) PSVTS may, upon verbal request, authorize a deviation from this section for a voyage, or part of a voyage, if the proposed deviation provides a level of safety equivalent to or beyond that provided by the required procedure. The deviation

request must be made well in advance to allow the requesting vessel and the Vessel Traffic Center (VTC) sufficient time to assess the safety of the proposed deviation. Discussions between the requesting vessel and the VTC should include, but are not limited to, information on vessel handling characteristics, traffic density, radar contracts, and environmental conditions.

- (3) In an emergency, the master, pilot, or person directing the movement of the vessel following the TSS may deviate from this section to the extent necessary to avoid endangering persons, property, or the environment, and shall report the deviation to the VTC as soon as possible.

§ 165.1302 Bangor Naval Submarine Base, Bangor, WA.

(a) *Location.* The following is a security zone: The waters of the Hood Canal encompassed by a line commencing on the east shore of Hood Canal at latitude 47°43'17" N., longitude 122°44'44" W., thence to latitude 47°43'32" N., longitude 122°44'40" W.; thence to latitude 47°43'50" N., longitude 122°44'40" W.; thence to latitude 47°44'24" N., longitude 122°44'22" W.; thence to latitude 47°45'47" N., longitude 122°43'22" W.; thence to latitude 47°46'23" N., longitude 122°42'42" W.; thence to latitude 47°46'23" N., longitude 122°42'20" W.; thence to latitude 47°46'20" N., longitude 122°42'12" W.: thence southerly along the shoreline to the point of beginning.

(b) *Security zone anchorage.* The following is a security zone anchorage: Area No. 2. Waters of Hood Canal within a circle of 1,000 yards diameter centered on a point located at latitude 47°46'26" N., longitude 122°42'49" W.

(c) *Special Regulations*

- (1) Section 165.33 paragraphs, (a), (e), and (f) do not apply to the following vessels or individuals on board those vessels:
 - i. Public vessels of the United States, other than United States Naval vessels.
 - ii. Vessels that are performing work at Naval Submarine Base Bangor pursuant to a contract with the United States Navy which requires their presence in the security zone.
 - iii. Any other vessels or class of vessels mutually agreed upon in advance by the Captain of the Port and Commanding Officer, Naval Submarine Base Bangor. Vessels operating in the security zone under this exemption must have previously obtained a copy of a certificate of exemption permitting their operation in the security zone from the Security Office, Naval Submarine Base Bangor. This written exemption shall state the date(s) on which it is effective and may contain any further restrictions on vessel operations within the security zone as have been previously agreed upon by the Captain of the Port and Commanding Officer, Naval Submarine Base Bangor. The certificate of exemption shall be maintained on board the exempted vessel so long as such vessel is operating in the security zone.
- (2) Any vessel authorized to enter or remain in the security zone may anchor in the security zone anchorage.

- (3) Other vessels desiring access to this zone shall secure permission from the Captain of the Port through the Security Office of the Naval Submarine Base Bangor. The request shall be forwarded in a timely manner to the Captain of the Port by the appropriate Navy official.
- (d) *Enforcement.* The U.S. Coast Guard may be assisted in the patrol and monitoring of this security zone by the U.S. Navy.

§ 165.1303 Puget Sound and adjacent waters, WA—regulated navigation area.

- (a) The following is a regulated navigation area: the waters of the United States east of a line extending from Discovery Island Light to New Dungeness Light and all points in the Puget Sound area north and south of these lights.

(b) *Regulations.*

- (1) Tank vessel navigation restrictions: Tank vessels larger than 125,000 deadweight tons bound for a port or place in the United States may not operate in the regulated navigation area.
- (2) Commander, Thirteenth Coast Guard District may, upon written request, issue an authorization to deviate from paragraph (b)(1) of this section if it is determined that such deviation provides an adequate level of safety. Any application for authorization must state the need and fully describe the proposed procedure.

(c) *Precautionary Area Regulations.*

- (1) A vessel in a precautionary area which is depicted on National Oceanic and Atmospheric Administration (NOAA) nautical charts, except precautionary “RB” (a circular area of 2,500 yards radius centered at 48–26'24" N., 122–45'12" W.), must keep the center of the precautionary area to port.

Note: The center of precautionary area “RB” is not marked by a buoy.

- (2) The Vessel Traffic Service Puget Sound (PSVTS) may, upon verbal request, authorize a onetime deviation from paragraph (c)(1) of this section for a voyage, or part of a voyage, if the proposed deviation provides a level of safety equivalent to or beyond that provided by the required procedure. The deviation request must be made well in advance to allow the requesting vessel and the Vessel Traffic Center (VTC) sufficient time to assess the safety of the proposed deviation. Discussions between the requesting vessel and the VTC should include, but are not limited to, information on the vessel handling characteristics, traffic density, radar contacts, and environmental conditions.
- (3) In an emergency, the master, pilot, or person directing the movement of the vessel may deviate from paragraph (c)(1) of this section to the extent necessary to avoid endangering persons, property, or the environment, and shall report the deviation to the VTC as soon as possible.

§ 165.1305 Commencement Bay, Tacoma, WA.

- (a) *Location.* The following area is a safety zone: All portions of Commencement Bay bounded by the following coordinates: Latitude 47°17'34" N, Longitude 122°28'36" W; thence to Latitude 47°17'06" N, Longitude 122°27'40" W; thence to Latitude 47°16'42" N, Longitude 122°28'06" W; thence to Latitude 47°17'10" W, Longitude 122°29'02" W; thence returning to the origin. This safety zone resembles a rectangle lying adjacent to the shoreline along Ruston Way. Floating markers will be placed by the sponsor of the event to delineate the boundaries of the safety zone. [Datum: NAD 1983].
- (b) *Effective dates.* This section is effective annually on July the fourth from 2 p.m. to 12:30 a.m. July the fifth unless otherwise specified by Federal Register notice.
- (c) *Regulation.* In accordance with the general regulations in §165.23 of this part, entry into this safety zone is prohibited unless authorized by the Captain of the Port, Puget Sound, Seattle, WA.

§ 165.1307 Elliott Bay, Seattle, WA.

- (a) *Location.* The following area is a safety zone: All portions of Elliott Bay bounded by the following coordinates: Latitude 47°37'22" N, Longitude 122°22'06" W; thence to Latitude 47°37'06" N, Longitude 122°21'45" W; thence to Latitude 47°36'54" N, Longitude 122°22'05" W; thence to Latitude 47°37'08" N, Longitude 122°22'27" W; thence returning to the origin. This safety zone resembles a square centered around the barge from which the fireworks will be launched and begins 100 yards from the shoreline of Myrtle Edwards Park. Floating markers will be placed by the sponsor of the fireworks display to delineate the boundaries of the safety zone [Datum NAD 1983].
- (b) *Effective dates.* This section is effective annually on July fourth from 9:30 p.m. to 11 p.m. unless otherwise specified by Federal Register notice.
- (c) *Regulation.* In accordance with the general regulations in §165.23 of this part, entry into this safety zone is prohibited unless authorized by the Captain of the Port, Puget Sound, Seattle, WA.

§ 165.1309 Eagle Harbor, Bainbridge Island, WA.

- (a) *Regulated Area.* A regulated navigation area is established on that portion of Eagle Harbor bounded by a line beginning at: 47°36'56" N, 122°30'36" W; thence to 47°37'11" N, 122°30'36" W; thence to 47°37'25" N, 122°30'17" W; thence to 47°37'24" N, 122°30'02" W; thence to 47°37'16" N, 122°29'55" W; thence to 47°37'03" N, 122°30'027sec; W; thence returning along the shoreline to point of origin. [Datum NAD 1983].
- (b) *Regulations.* All vessels and persons are prohibited from anchoring, dredging, laying cable, dragging, seining, bottom fishing, conducting salvage operations, or any other activity which could potentially disturb the seabed in the designated area. Vessels may otherwise transit or navigate within this area without reservation.

- (c) *Waiver*. The Captain of the Port, Puget Sound, upon advice from the U.S. EPA Project Manager and the Washington State Department of Natural Resources, may, upon written request, authorize a waiver from this section if it is determined that the proposed operation supports USEPA remedial objectives, or can be performed in a manner that ensures the integrity of the sediment cap. A written request must describe the intended operation, state the need, and describe the proposed precautionary measures. Requests should be submitted in triplicate, to facilitate review by U.S. EPA, Coast Guard, and Washington State Agencies. USEPA managed remedial design, remedial action, habitat mitigation, or monitoring activities associated with the Wyckoff/Eagle Harbor Superfund Site are excluded from the waiver requirement. USEPA is required, however, to alert the Coast Guard in advance concerning any of the above-mentioned activities that may, or will, take place in the Regulated Area.

§ 165.1310 Strait of Juan de Fuca and adjacent coastal waters of Northwest Washington; Makah Whale Hunting—Regulated Navigation Area.

- (a) The following area is a Regulated Navigation Area (RNA): From 48°02.25' N, 124°42.1' W northward along the mainland shoreline of Washington State to Cape Flattery and thence eastward along the mainland shoreline of Washington State to 48°22' N, 124°34' W; thence due north to 48°24.55' N, 124°34' W; thence northwesterly to 48°27.1' N, 124°41.7' W; thence due west to 48°27.1' N, 124°45.5' W; thence southwestly to 48°20.55' N, 124°51.05' W, thence west south west to 48°18.0' N 124°59.0' W, thence due south to 48°02.25' N, 124°59.0' W) thence due east back to the shoreline of Washington at 48°02.25' N, 124°42.1' W. Datum: NAD 1983.
- (b) During a whale hunt, while the international numeral pennant five (5) is flown by a Makah whale hunt vessel, the following area within the RNA is a Moving Exclusion Zone: The column of water from the surface to the seabed with a radius of 500 yards centered on the Makah whale hunt vessel displaying international numeral pennant five (5). This Moving Exclusionary Zone is activated only when surface visibility exceeds one nautical mile, between sunrise and sunset, and the Makah whale hunt vessel displays the international numeral pennant five (5). The Moving Exclusionary Zone is deactivated upon sunset, visibility is reduced to less than one nautical mile, or when the Makah hunt vessel strikes international numeral pennant five (5).
- (c) Unless otherwise authorized by the Commander, Thirteenth Coast Guard District or his or her representative, no person or vessel may enter the active Moving Exclusionary Zone except for:
- (1) Authorized Makah whale hunt vessel actively engaged in hunting operations under direction of the master of the Makah vessel flying international numeral pennant five (5), and
 - (2) A single authorized media pool vessel operating in accordance with paragraph (f) of this section.
- (d) The international numeral pennant five (5) is only authorized to be displayed from one Makah whale hunt vessel during actual whale hunt operations. No other vessels may display this pennant within the RNA at any time. Whale hunt operations commence when

a whale hunt vessel is underway and its master intends to have a whale killed during the voyage. Whale hunt operations cease once this intent is abandoned, a whale is landed, or when the international numeral pennant five (5) is struck.

- (e) The Makah Tribe shall make SECURITE broadcasts beginning one half hour before the commencement of a hunt and every half hour thereafter until hunting activities are concluded. This broadcast shall be made on channel 16 VHF-FM and state:

A whale hunt is proceeding today within the Regulated Navigation Area established for Makah whaling activities. The (name of vessel) is a (color and description of vessel) and will be flying international numeral pennant five (5) while engaged in whaling operations. This pennant is yellow and blue in color. Mariners are required by federal regulation to stay 500 yards away from (name of vessel), and are strongly urged to remain even further away from whale hunt activities as an additional safety measure.

(f)

- (1) Credentialed members of the media interested in entering the Moving Exclusionary Zone may request permission to operate a single media vessel in the Moving Exclusionary Zone by telephoning Coast Guard Public Affairs, as soon as practicable at (206) 220-7237 during normal working hours, and (206) 220-7001 after hours. Coast Guard preauthorization is required prior to entry into the Moving Exclusionary Zone by a single media pool vessel.
- (2) The media pool vessel must be a U.S. documented vessel. The media pool vessel must be under command at all times within the Moving Exclusionary zone by a master licensed in the U.S. to carry passenger for hire. All expenses, liabilities and risks associated with operation of the media pool vessel lie with members of the pool and the pool vessel owners and operators.
- (3) The master of the media pool vessel shall maneuver to avoid positioning the pool vessel between whales and hunt vessel(s), out of the line of fire, at a prudent distance and location relative to whale hunt operations, and in a manner that avoids hindering the hunt or path of the whale in any way.
- (4) Although permitted to maneuver within the Moving Exclusionary Zone, personnel aboard the media pool vessel are still required to follow safety and law enforcement related instructions of Coast Guard personnel.

§ 165.1311 Olympic View Resource Area, Tacoma, WA.

- (a) *Regulated Area.* A regulated navigation area is established on that portion of Commencement Bay bounded by a line beginning at: 47°15'40.19753" N, 122°26'09.27617" W; thence to 47°15'42.21070" N, 122°26'10.65290" W; thence to 47°15'41.84696" N, 122°26'11.80062" W; thence to 47°15'45.57725" N, 122°26'14.35173" W; thence to 47°15'53.06020" N, 122°26'06.61366" W; thence to 47°15'46.74493" N, 122°26'02.50574" W; thence returning along the shoreline to the point of origin. [Datum NAD 1983].
- (b) *Regulations.* All vessels and persons are prohibited from anchoring, dredging, laying cable, dragging, seining, bottom fishing, conducting salvage operations, or any other activity which could potentially disturb the seabed in the designated area. Vessels may otherwise transit or navigate within this area without reservation.

- (c) *Waiver.* The Captain of the Port, Puget Sound, upon advice from the United States Environmental Protection Agency (USEPA) Project Manager and the Washington State Department of Natural Resources, may, upon written request, authorize a waiver from this section if it is determined that the proposed operation supports USEPA remedial objectives, or can be performed in a manner that ensures the integrity of the sediment cap. A written request must describe the intended operation, state the need, and describe the proposed precautionary measures. Requests shall be submitted in triplicate, to facilitate review by USEPA, Coast Guard, and Washington State Agencies. USEPA managed remedial design, remedial action, habitat mitigation, or monitoring activities associated with the Olympic View Resource Area Superfund Site are excluded from the waiver requirement. USEPA is required, however, to alert the Coast Guard in advance concerning any of the above-mentioned activities that may, or will, take place in the Regulated Area.

§ 165.1313 Security zone regulations, tank ship protection, Puget Sound and adjacent waters, Washington

- (a) *Notice of enforcement or suspension of enforcement.* The tank ship security zone established by this section will be enforced only upon notice by the Captain of the Port Puget Sound. Captain of the Port Puget Sound will cause notice of the enforcement of the tank ship security zone to be made by all appropriate means to effect the widest publicity among the affected segments of the public including publication in the Federal Register as practicable, in accordance with 33 CFR 165.7(a). Such means of notification may also include but are not limited to, Broadcast Notice to Mariners or Local Notice to Mariners. The Captain of the Port Puget Sound will issue a Broadcast Notice to Mariners and Local Notice to Mariners notifying the public when enforcement of the tank ship security zone is suspended.
- (b) The following definitions apply to this section:
- (1) *Federal Law Enforcement Officer* means any employee or agent of the United States government who has the authority to carry firearms and make warrantless arrests and whose duties involve the enforcement of criminal laws of the United States.
 - (2) *Navigable waters of the United States* means those waters defined as such in 33 CFR part 2.
 - (3) *Navigation Rules* means the Navigation Rules, International-Inland.
 - (4) *Official patrol* means those persons designated by the Captain of the Port to monitor a tank ship security zone, permit entry into the zone, give legally enforceable orders to persons or vessels within the zone and take other actions authorized by the Captain of the Port. Persons authorized in paragraph (k) to enforce this section are designated as the official patrol.
 - (5) *Public vessel* means vessels owned, chartered, or operated by the United States, or by a State or political subdivision thereof.
 - (6) *Tank ship security zone* is a regulated area of water, established by this section, surrounding tank ships for a 500-yard radius that is necessary to provide for the security of these vessels.

- (7) ***Tank ship*** means a self-propelled tank vessel that is constructed or adapted primarily to carry oil or hazardous material in bulk as cargo or cargo residue in the cargo spaces. The definition of tank ship does not include tank barges.
- (8) ***Washington Law Enforcement Officer*** means any General Authority Washington Peace Officer, Limited Authority Washington Peace Officer, or Specially Commissioned Washington Peace Officer as defined in Revised Code of Washington section 10.93.020.
- (c) ***Security zone***: There is established a tank ship security zone extending for a 500-yard radius around all tank ships located in the navigable waters of the United States in Puget Sound, WA, east of 123 degrees, 30 minutes West Longitude. [Datum: NAD 1983]
- (d) ***Compliance***: The tank ship security zone established by this section remains in effect around tank ships at all times, whether the tank ship is underway, anchored, or moored. Upon notice of enforcement by the Captain of the Port Puget Sound, the Coast Guard will enforce the tank ship security zone in accordance with rules set out in this section. Upon notice of suspension of enforcement by the Captain of the Port Puget Sound, all persons and vessels are authorized to enter, transit, and exit the tank ship security zone, consistent with the Navigation Rules.
- (e) The Navigation Rules shall apply at all times within a tank ship security zone.
- (f) When within a tank ship security zone all vessels shall operate at the minimum speed necessary to maintain a safe course and shall proceed as directed by the on-scene official patrol or tank ship master. No vessel or person is allowed within 100 yards of a tank ship, unless authorized by the on-scene official patrol or tank ship master.
- (g) To request authorization to operate within 100 yards of a tank ship, contact the on-scene official patrol or tank ship master on VHF-FM channel 16 or 13.
- (h) When conditions permit, the on-scene official patrol or tank ship master should:
- (1) Permit vessels constrained by their navigational draft or restricted in their ability to maneuver to pass within 100 yards of a tank ship in order to ensure a safe passage in accordance with the Navigation Rules;
 - (2) Permit commercial vessels anchored in a designated anchorage area to remain at anchor when within 100 yards of a passing tank ship; and
 - (3) Permit vessels that must transit via a navigable channel or waterway to pass within 100 yards of a moored or anchored tank ship with minimal delay consistent with security.
- (i) ***Exemption***. Public vessels as defined in paragraph (b) of this section are exempt from complying with paragraphs (c), (d), (f), (g), (h), (j), and (k) of this section.
- (j) ***Exception***. 33 CFR Part 161 promulgates Vessel Traffic Service regulations. Measures or directions issued by Vessel Traffic Service Puget Sound pursuant to 33 CFR Part 161 shall take precedence over the regulations in this section.
- (k) ***Enforcement***. Any Coast Guard commissioned, warrant or petty officer may enforce the rules in this section. In the navigable waters of the United States to which this section

applies, when immediate action is required and representatives of the Coast Guard are not present or not present in sufficient force to provide effective enforcement of this section in the vicinity of a tank ship, any Federal Law Enforcement Officer or Washington Law Enforcement Officer may enforce the rules contained in this section pursuant to 33 CFR §6.04–11. In addition, the Captain of the Port may be assisted by other federal, state or local agencies in enforcing this section.

§ 165.1317 Security and Safety Zone; Large Passenger Vessel Protection, Puget Sound and adjacent waters, Washington.

- (a) *Notice of enforcement or suspension of enforcement.* The large passenger vessel security and safety zone established by this section will be enforced only upon notice by the Captain of the Port Puget Sound. Captain of the Port Puget Sound will cause notice of the enforcement of the large passenger vessel security and safety zone to be made by all appropriate means to effect the widest publicity among the affected segments of the public including publication in the Federal Register as practicable, in accordance with 33 CFR 165.7(a). Such means of notification may also include but are not limited to, Broadcast Notice to Mariners or Local Notice to Mariners. The Captain of the Port Puget Sound will issue a Broadcast Notice to Mariners and Local Notice to Mariners notifying the public when enforcement of the large passenger vessel security and safety zone is suspended.
- (b) *Definitions.* The following definitions apply to this section:

Federal Law Enforcement Officer means any employee or agent of the United States government who has the authority to carry firearms and make warrantless arrests and whose duties involve the enforcement of criminal laws of the United States.

Large Passenger Vessel means any cruise ship over 100 feet in length carrying passengers for hire, and any auto ferries and passenger ferries over 100 feet in length carrying passengers for hire such as the Washington State Ferries, M/V COHO and Alaskan Marine Highway Ferries. Large Passenger Vessel does not include vessels inspected and certificated under 46 CFR, Chapter I, Subchapter T such as excursion vessels, sight seeing vessels, dinner cruise vessels, and whale watching vessels.

Large Passenger Vessel Security and Safety Zone is a regulated area of water established by this section, surrounding large passenger vessels for a 500-yard radius to provide for the security and safety of these vessels.

Navigable waters of the United States means those waters defined as such in 33 CFR part 2.

Navigation Rules means the Navigation Rules, International—Inland.

Official Patrol means those persons designated by the Captain of the Port to monitor a large passenger vessel security and safety zone, permit entry into the zone, give legally enforceable orders to persons or vessels within the zone and take other actions authorized by the Captain of the Port. Persons authorized in paragraph (1) to enforce this section are designated as the Official Patrol.

Public vessel means vessels owned, chartered, or operated by the United States, or by a

State or political subdivision thereof.

Washington Law Enforcement Officer means any General Authority Washington Peace Officer, Limited Authority Washington Peace Officer, or Specially Commissioned Washington Peace Officer as defined in Revised Code of Washington section 10.93.020.

- (c) *Security and safety zone.* There is established a large passenger vessel security and safety zone extending for a 500-yard radius around all large passenger vessels located in the navigable waters of the United States in Puget Sound, WA, east of 123°30' West Longitude. [Datum: NAD 1983].
- (d) *Compliance.* The large passenger vessel security and safety zone established by this section remains in effect around large passenger vessels at all times, whether the large passenger vessel is underway, anchored, or moored. Upon notice of enforcement by the Captain of the Port Puget Sound, the Coast Guard will enforce the large passenger vessel security and safety zone in accordance with rules set out in this section. Upon notice of suspension of enforcement by the Captain of the Port Puget Sound, all persons and vessels are authorized to enter, transit, and exit the large passenger vessel security and safety zone, consistent with the Navigation Rules.
- (e) The Navigation Rules shall apply at all times within a large passenger vessel security and safety zone.
- (f) When within a large passenger vessel security and safety zone all vessels must operate at the minimum speed necessary to maintain a safe course and must proceed as directed by the on-scene official patrol or large passenger vessel master. No vessel or person is allowed within 100 yards of a large passenger vessel that is underway or at anchor, unless authorized by the on-scene official patrol or large passenger vessel master. No vessel or person is allowed within 25 yards of a large passenger vessel that is moored.
- (g) To request authorization to operate within 100 yards of a large passenger vessel that is underway or at anchor, contact the on-scene official patrol or large passenger vessel master on VHF-FM channel 16 or 13.
- (h) When conditions permit, the on-scene official patrol or large passenger vessel master should:
 - (1) Permit vessels constrained by their navigational draft or restricted in their ability to maneuver to pass within 100 yards of a large passenger vessel in order to ensure a safe passage in accordance with the Navigation Rules; and
 - (2) Permit vessels that must transit via a navigable channel or waterway to pass within 100 yards of an anchored large passenger vessel or within 25 yards of a moored large passenger vessel with minimal delay consistent with security.
- (i) When a large passenger vessel approaches within 100 yards of any vessel that is moored or anchored, the stationary vessel must stay moored or anchored while it remains within the large passenger vessel's security and safety zone unless it is either ordered by, or given permission by the Captain of the Port Puget Sound, his designated representative or the on-scene official patrol to do otherwise.

- (j) *Exemption.* Public vessels as defined in paragraph (b) of this section are exempt from complying with paragraphs (c), (d), (f), (g), (h), and (i), of this section.
- (k) *Exception.* 33 CFR part 161 contains Vessel Traffic Service regulations. When measures or directions issued by Vessel Traffic Service Puget Sound pursuant to 33 CFR part 161 also apply, the measures or directions govern rather than the regulations in this section.
- (l) *Enforcement.* Any Coast Guard commissioned, warrant or petty officer may enforce the rules in this section. In the navigable waters of the United States to which this section applies, when immediate action is required and representatives of the Coast Guard are not present or not present in sufficient force to provide effective enforcement of this section in the vicinity of a large passenger vessel, any Federal Law Enforcement Officer or Washington Law Enforcement Officer may enforce the rules contained in this section pursuant to 33 CFR 6.04–11. In addition, the Captain of the Port may be assisted by other federal, state or local agencies in enforcing this section.
- (m) *Waiver.* The Captain of the Port Puget Sound may waive any of the requirements of this section for any vessel or class of vessels upon finding that a vessel or class of vessels, operational conditions or other circumstances are such that application of this section is unnecessary or impractical for the purpose of port security, safety or environmental safety.

§ 165.1319 Safety Zone Regulations, Seafair Blue Angels Air Show Performance, Seattle, WA.

- (a) *Enforcement period.* This section will be enforced annually during the last week in July and the first two weeks of August from 8 a.m. until 4 p.m., each day during the event. The event will be one week or less in duration. The specific dates during this time frame will be published in the Federal Register.
- (b) *Location.* The following is a safety zone: All waters of Lake Washington, Washington State, enclosed by the following points: Near the termination of Roanoke Way 47°35'44" N, 122°14'47" W; thence to 47°35'48" N, 122°15'45" W; thence to 47°36'02.1" N, 122°15'50.2" W; thence to 47°35'56.6" N, 122°16'29.2" W; thence to 47°35'42" N, 122°16'24" W; thence to the east side of the entrance to the west highrise of the Interstate 90 bridge; thence westerly along the south side of the bridge to the shoreline on the western terminus of the bridge; thence southerly along the shoreline to Andrews Bay at 47°33'06" N, 122°15'32" W; thence northeast along the shoreline of Bailey Peninsula to its northeast point at 47°33'44" N, 122°15'04" W; thence easterly along the east-west line drawn tangent to Bailey Peninsula; thence northerly along the shore of Mercer Island to the point of origin. [Datum: NAD 1983]
- (c) *Regulations.* In accordance with the general regulations in 33 CFR Part 165, Subpart C, no person or vessel may enter or remain in the zone except for support vessels and support personnel, vessels registered with the event organizer, or other vessels authorized by the Captain of the Port or his designated representatives. Vessels and persons granted authorization to enter the safety zone shall obey all lawful orders or directions of the Captain of the Port or his designated representatives.

§ 165.1321 Security Zone; Protection of Military Cargo, Captain of the Port Zone Puget Sound, WA.

(a) *Notice of enforcement or suspension of enforcement.* The Captain of the Port Puget Sound will enforce the security zones established by this section only upon notice. Captain of the Port Puget Sound will cause notice of the enforcement of these security zone to be made by all appropriate means to effect the widest publicity among the affected segments of the public including publication in the Federal Register as practicable, in accordance with 33 CFR 165.7(a). Such means of notification may also include but are not limited to, Broadcast Notice to Mariners or Local Notice to Mariners. The Captain of the Port Puget Sound will issue a Broadcast Notice to Mariners and Local Notice to Mariners notifying the public when enforcement of these security zones is suspended.

(b) *Definitions.* The following definitions apply to this section:

Designated Representative means those persons designated by the Captain of the Port to monitor these security zones, permit entry into these zones, give legally enforceable orders to persons or vessels with in these zones and take other actions authorized by the Captain of the Port. Persons authorized in paragraph (g) to enforce this section and Vessel Traffic Service Puget Sound (VTS) are Designated Representatives.

Federal Law Enforcement Officer means any employee or agent of the United States government who has the authority to carry firearms and make warrantless arrests and whose duties involve the enforcement of criminal laws of the United States.

Navigable waters of the United States means those waters defined as such in 33 CFR Part 2.

Public vessel means vessels owned, chartered, or operated by the United States, or by a State or political subdivision thereof.

Washington Law Enforcement Officer means any General Authority Washington Peace Officer, Limited Authority Washington Peace Officer, or Specially Commissioned Washington Peace Officer as defined in Revised Code of Washington section 10.93.020.

Security zone. The following areas are security zones:

- (1) ***Blair Waterway Security Zone:*** The Security Zone in the Blair Waterway, Commencement Bay, WA, includes all waters enclosed by a line connecting the following points: 47°16'57" N, 122°24'39" W, which is approximately the beginning of Pier No. 23 (also known as the Army pier); then northwesterly to 47°17'05" N, 122°24'52" W, which is the end of the Pier No. 23 (Army pier); then southwesterly to 47°16'42" N, 122°25' 18" W, which is the approximate location of a private buoy on the end of the sewage outfall; then southeasterly to 47°16'33" N, 122°25'04" W, which is approximately the northwestern end of Pier No. 5; then northeasterly to the northwestern end of Pier No. 1; then southeasterly along the shoreline of the Blair Waterway to the Blair Waterway turning basin; then along the shoreline around the Blair Waterway turning basin; then northwesterly along the shoreline of the Blair Waterway to the Commencement Bay Directional

Light (light list number 17159); then northeasterly along the shoreline to the point of origin. [Datum: NAD 1983].

- (2) *Sitcum Waterway Security Zone*: The Security Zone in the Sitcum Waterway, Commencement Bay, WA, includes all waters enclosed by a line connecting the following points: 47°16'33" N, 122°25'04" W, which is approximately the northwestern end of Pier No. 5; then northwesterly to 47°16'42" N, 122°25'18" W, which is the approximate location of a private buoy on the end of the sewage outfall; then southwesterly to 47°16'23" N, 122°25'36" W; then southeasterly to 47°16'10" N, 122°25'27" W, which is the northwestern corner of Pier No. 2; then extending northeasterly to 47°16'13" N, 122°25'13" W; then extending southeasterly along the shoreline of the Sitcum Waterway; then northeasterly along the shoreline at the terminus of the Sitcum Waterway and then northwesterly along the shoreline of the Sitcum Waterway; then northeasterly along the shoreline of Pier No. 5 to the point of origin. [Datum: NAD 1983].
 - (3) *Budd Inlet Security Zone*: The Security Zone in Budd Inlet, West Bay, Olympia WA includes all waters enclosed by a line connecting the following points: 47°03'12" N, 122°54'21" W, which is approximately the northwestern end of the fence line enclosing Berth 1 at Port of Olympia; then northerly to 47°03'15" N, 122°54'21" W, which is the approximate 300 feet north along the shoreline; then westerly to 47°03'15" N, 122°54'26" W; then southerly to 47°03'06" N, 122°54'26" W; then southeasterly to 47°03'03" N, 122°54'20" W, which is approximately the end of the T-shaped pier; then north to 47°03'04" N, 122°54'19.5" W, which is approximately the southwestern corner of berth 1; then northerly along the shoreline to the point of origin. [Datum: NAD 1983].
- (c) *Obtaining permission to enter, move within, or exit the security zones*. All vessels must obtain permission from the COTP or a Designated Representative to enter, move within, or exit the security zones established in this section when these security zones are enforced. Vessels 20 meters or greater in length should seek permission from the COTP or a Designated Representative at least 4 hours in advance. Vessels less than 20 meters in length should seek permission at least 1 hour in advance. VTS Puget Sound may be reached on VHF channel 14.
- (d) *Compliance*. Upon notice of enforcement by the Captain of the Port Puget Sound, the Coast Guard will enforce these security zones in accordance with rules set out in this section. Upon notice of suspension of enforcement by the Captain of the Port Puget Sound, all persons and vessels are authorized to enter, transit, and exit these security zones.
- (e) *Regulations*. Under the general regulations in 33 CFR part 165 subpart D, this section applies to any vessel or person in the navigable waters of the United States to which this section applies. No person or vessel may enter the security zones established in this section unless authorized by the Captain of the Port or his designated representatives. Vessels and persons granted permission to enter the security zone shall obey all lawful orders or directions of the Captain of the Port or his designated representatives. All vessels shall operate at the minimum speed necessary to maintain a safe course.

- (f) *Enforcement.* Any Coast Guard commissioned, warrant or petty officer may enforce the rules in this section. In the navigable waters of the United States to which this section applies, when immediate action is required and representatives of the Coast Guard are not present or not present in sufficient force to provide effective enforcement of this section, any Federal Law Enforcement Officer or Washington Law Enforcement Officer may enforce the rules contained in this section pursuant to 33 CFR 6.04–11. In addition, the Captain of the Port may be assisted by other federal, state or local agencies in enforcing this section pursuant to 33 CFR 6.04–11.
- (g) *Exemption.* Public vessels as defined in paragraph (b) of this section are exempt from the requirements in this section.
- (h) *Waiver.* For any vessel, the Captain of the Port Puget Sound may waive any of the requirements of this section, upon finding that operational conditions or other circumstances are such that application of this section is unnecessary or impractical for the purpose of port security, safety or environmental safety.

§ 165.1324 Safety and Security Zone; Cruise Ship Protection, Elliott Bay and Pier-91, Seattle, Washington.

(a) *Safety and security zones.* (1) The following area is a safety and security zone: All waters within the following points: a rectangle, starting at 47°37'53" N/122°23'07" W, thence south to position 47°37'06" N/122°23'07" W, thence east to position 47°37'06" N/122°22'43" W, thence north to position 47°37'58" N/122°22'43" W. This zone will be enforced only during the arrival or departure of Large Passenger Cruise Vessels at Pier 91, Seattle, Washington.

(2) The following area is a safety and security zone: All waters within 100 yards of Pier 91, Seattle, Washington, at approximate position 47°37'35" N/122°23'00" W. This zone will be enforced only when a Large Passenger Cruise Vessel is moored at Pier 91.

(b) *Regulations.* In accordance with the general regulations in 33 CFR Part 165, Subpart D, no person or vessel may enter or remain in either Safety and Security Zone except for vessels authorized by the Captain of the Port or Designated Representatives.

(c) *Definitions.* The following definitions apply to this section:

Facility Security Officer means the person designated as responsible for the development, implementation, revision and maintenance of the facility security plan and for liaison with the COTP and Company and Vessel Security Officers.

Large Passenger Cruise Vessel means any cruise ship over 100 feet in length carrying passengers for hire. Large Passenger Cruise Vessel does not include vessels inspected and certificated under 46 CFR, Chapter I, Subchapter T such as excursion vessels, sight seeing vessels, dinner cruise vessels, and whale watching vessels.

Official Patrol means those persons designated by the Captain of the Port to monitor a Large Passenger Cruise Vessel security and safety zone, permit entry into the zone, give legally enforceable orders to persons or vessels within the zone and take other actions authorized by the Captain of the Port. Persons authorized in paragraph (e) to enforce this section are designated as the Official Patrol.

(d) *Authorization.* To request authorization to operate within 100 yards of a Large Passenger Cruise Vessel that is moored at Pier 91, contact the on-scene Official Patrol on VHF-FM channel 16 or 13 or the Facility Security Officer at (206) 728-3688.

(e) *Enforcement.* Any Coast Guard commissioned, warrant or petty officer may enforce the rules in this section. In the navigable waters of the United States to which this section applies, when immediate action is required and representatives of the Coast Guard are not present or not present in sufficient force to provide effective enforcement of this section in the vicinity of a Large Passenger Cruise Vessel, any Federal or Washington Law Enforcement Officer may enforce the rules contained in this section pursuant to 33 CFR 6.04-11. In addition, the Captain of the Port may be assisted by other Federal, state or local agencies in enforcing this section.

(f) *Waiver.* The Captain of the Port Puget Sound may waive any of the requirements of this section for any vessel or class of vessels upon finding that a vessel or class of vessels, operational conditions or other circumstances are such that application of this section is unnecessary or impractical for the purpose of port security, safety or environmental safety.

§ 165.1327 Security Zone; escorted U.S. Navy submarines in Sector Seattle Captain of the Port Zone.

(a) *Location.* The following area is a security zone: All waters within 1000 yards of any U.S. Navy submarine that is operating in the Sector Puget Sound Captain of the Port Zone, as defined in 33 CFR Section 3.65-10, and is being escorted by the Coast Guard.

(b) *Regulations.* In accordance with the general regulations in 33 CFR Section 165, Subpart D, no person or vessel may enter or remain in the security zone created by paragraph (a) of this section unless authorized by the Coast Guard patrol commander. The Coast Guard patrol commander will coordinate with Vessel Traffic System users on a case-by-case basis to make appropriate passing arrangements under the circumstances. 33 CFR Section 165, Subpart D, contains additional provisions applicable to the security zone created in paragraph (a) of this section.

(c) *Notification.* The Coast Guard security escort will attempt, when necessary and practicable, to notify any persons or vessels inside or in the vicinity of the security zone created in paragraph (a) of this section of its existence via VHF Channel 16 and/or any other means reasonably available.

§ 165.1328 Regulated Navigation Area; U.S. Navy submarines, Hood Canal, WA.

(a) *Location.* The following area is a regulated navigation area (RNA): All waters of the Hood Canal in the State of Washington whenever any U.S. Navy submarine is operating in the Hood Canal and is being escorted by the Coast Guard. For purposes of this section, "Hood Canal" means all waters of Hood Canal, including Dabob Bay, located between two lines with the first line connecting positions 47°37.9' N, 122°57.1' W and 47°37.9' N, 122°52.9' W and the second line connecting positions 48°00.7' N, 122°41.0' W and 47°56.4' N, 122°36.9' W

(b) *Regulations.* All persons and vessels located within the RNA created by paragraph (a) of this section shall follow all lawful orders and/or directions given to them by Coast Guard security escort personnel. 33 CFR Section 165, Subpart B, contains additional provisions applicable to the RNA created in paragraph (a) of this section.

(c) *Notification.* The Coast Guard security escort will attempt, when necessary and practicable, to notify any persons or vessels in the RNA created in paragraph (a) of this section of its existence via VHF Channel 16 and/or any other means reasonably available.

§ 165.1329 Regulated Navigation Area; Thea Foss and Wheeler-Osgood Waterways EPA Superfund Cleanup Site, Commencement Bay, Tacoma, WA.

(a) *Regulated areas.* The following areas are regulated navigation areas:

(1) All waters of the Thea Foss Waterway bounded by a line connecting the following points: Point 1: 47°15'43.49" N, 122°26'23.29" W; Point 2: 47°15'44.59" N, 122°26'19.89" W; Point 3: 47°15'39.01" N, 122°26'15.99" W; Point 4: 47°15'37.91" N, 122°26'19.39" W. [Datum: NAD 1983].

(2) All waters of the Thea Foss Waterway bounded by a line connecting the following points: Point 1: 47°15'22.74" N, 122°25'57.15" W; Point 2: 47°15'22.52" N, 122°26'0.18" W; Point 3: 47°15'18.05" N, 122°25'59.48" W; Point 4: 47°15'18.26" N, 122°25'56.45" W. [Datum: NAD 1983].

(3) All waters of the Thea Foss and Wheeler-Osgood Waterways south of a line bounded by connecting the following points: Point 1: 47°15'13.94" N, 122°26'05.56" W; Point 2: 47°15'15.01" N, 122°25'55.14" W. [Datum: NAD 1983].

(b) *Regulations.* (1) All vessels and persons are prohibited from activities that would disturb the seabed, such as anchoring, dragging, trawling, spudding, or other activities that involve disrupting the integrity of the sediment caps installed in the designated regulated navigation area, pursuant to the remediation efforts of the U.S. Environmental Protection Agency (EPA) and others in the Thea Foss and Wheeler-Osgood Waterways EPA superfund cleanup site. Vessels may otherwise transit or navigate within this area without reservation.

(2) The prohibition described in paragraph (b)(1) of this section does not apply to vessels or persons engaged in activities associated with remediation efforts in the Thea Foss or Wheeler-Osgood Waterways superfund sites, provided that the Captain of the Port, Puget Sound (COTP), is given advance notice of those activities by the EPA.

(c) *Waiver.* Upon written request stating the need and proposed conditions of the waiver, and any proposed precautionary measures, the COTP may authorize a waiver from this section if the COTP determines that the activity for which the waiver is sought can take place without undue risk to the remediation efforts described in paragraph (b)(1) of this section. The COTP will consult with EPA in making this determination when necessary and practicable.

§ 165.1330 Safety Zone; Fleet Week Maritime Festival, Pier 66, Elliott Bay, Seattle, Washington.

(a) *Location.* The following area is a safety zone: All waters extending 100 yards from Pier 66, Elliott Bay, WA within a box encompassed by the points, 47°36.719' N, 122°21.099' W; 47°36.682' N, 122°21.149' W; 47°36.514' N, 122°20.865' W; and 47°36.552' N, 122°20.814' W.

(b) *Regulations.* In accordance with the general regulations in 33 CFR Part 165, Subpart C, no vessel operator may enter, transit, moor, or anchor within this safety zone, except for vessels authorized by the Captain of the Port or Designated Representative, thirty minutes prior to the beginning, during and thirty minutes following the conclusion of the Parade of Ships. For the

purpose of this rule, the Parade of Ships includes both the pass and review of the ships near Pier 66 and the aerial demonstrations immediately following the pass and review. The Captain of the Port may be assisted by other federal, state, or local agencies as needed.

(c) *Authorization.* In order to transit through this safety zone, authorization must be granted by the Captain of the Port, Puget Sound, or their Designated Representative. All vessel operators desiring entry into this safety zone shall gain authorization by contacting either the on-scene U.S. Coast Guard patrol craft on VHF Ch 13 or Ch 16, or Coast Guard Sector Puget Sound Joint Harbor Operations Center (JHOC) via telephone at (206) 217-6002. Requests shall indicate the reason why movement within the safety zone is necessary and the vessel's arrival and/or departure facility name, pier and/or berth. Vessel operators granted permission to enter this safety zone will be escorted by the on-scene patrol until no longer within the safety zone.

(d) *Enforcement period.* This rule is enforced annually during the parade of ships which typically occurs on a Wednesday during the last week of July or the first week in August from 8 a.m. until 8 p.m. unless cancelled sooner by the Captain of the Port.

§ 165.1332 Safety Zones; annual firework displays within the Captain of the Port, Puget Sound Area of Responsibility.

(a) *Safety Zones.* The following areas are designated safety zones:

(1) All waters of Puget Sound, Washington, extending to a 450 yard radius from the following launch sites: *See <http://www.ecfr.gov>

§ 165.1333 Security Zones, Seattle's Seafair Fleet Week moving vessels, Puget Sound, WA.

(a) *Location.* The following areas are security zones: all navigable waters within 500 yards of each designated participating vessel while each such vessel is in the Sector Puget Sound Captain of the Port (COTP) zone, as defined in 33 CFR 3.65-10, during a time specified in paragraph (e) of this section. The Coast Guard will publish a notice in the FEDERAL REGISTER each year at least 03 days before the start of the Seattle Seafair Fleet Week to identify the designated participating vessels for that year. The Coast Guard will also provide this information in the Local Notice to Mariners.

(b) *Definitions.* For purposes of this section—

Designated participating vessel means a military vessel participating in the Seattle Seafair Fleet Week that has been designated by the Sector Puget Sound COTP in accordance with this section.

Designated representative means any Coast Guard commissioned, warrant, or petty officer who has been designated by the COTP to implement or enforce this section.

Seattle Seafair Fleet Week means an annual event involving a parade of U.S. Navy, U.S. Coast Guard, and foreign military ships in Seattle's Elliott Bay waterfront and tours of those ships while docked at Port of Seattle facilities.

(c) *Regulations.* Under 33 CFR Part 165, Subpart D, no person or vessel may enter or remain in the security zones described in paragraph (a) of this section without the permission of the COTP or a designated representative. The COTP has granted general permission for vessels to enter the outer 400 yards of the security zones as long as those vessels within the outer 400 yards

of the security zones operate at the minimum speed necessary to maintain course unless required to maintain speed by the navigation rules. The COTP may be assisted by other federal, state or local agencies with the enforcement of the security zones.

(d) *Authorization.* All vessel operators who desire to enter the inner 100 yards of the security zones or transit the outer 400 yards at greater than minimum speed necessary to maintain course must obtain permission from the COTP or a Designated Representative by contacting the on-scene Coast Guard patrol craft on VHF 13 or Ch 16. Requests must include the reason why movement within this area is necessary. Vessel operators granted permission to enter the security zones will be escorted by the on-scene Coast Guard patrol craft until they are outside of the security zones.

(e) *Annual enforcement period.* The security zones described in paragraph (a) of this section will be enforced during Seattle Seafair Fleet Week each year for a period of up to one week. The Seattle Seafair Fleet Week will occur sometime between July 25 and August 14. The annual FEDERAL REGISTER notice identifying the designated participating vessels will also identify the specific dates of the event for that year.

§ 165.1334 Security Zone; U.S. Coast Guard BSU Seattle, Pier 36, Elliot Bay, Seattle, WA.

(a) *Location.* The following area is a security zone: All waters in Elliot Bay east of a line from 47°35'26.67" N 122°20'34.84" W to 47°35'23.69" N 122°20'34.77" W at Pier 36, Elliot Bay, Seattle, WA.

(b) *Regulations:* Under 33 CFR part 165, subpart D, no vessel may enter, transit, moor, or anchor within this security zone located at Pier 36, Elliot Bay, WA, except for vessels authorized by the Captain of the Port Puget Sound or Designated Representative.

(c) *Authorization:* To request authorization to operate within this security zone, contact United States Coast Guard Sector Puget Sound Joint Harbor Operations Center at 206-217-6001.

§ 165.1336 Regulated Navigation Area; Pacific Sound Resources and Lockheed Shipyard Superfund Sites, Elliott Bay, Seattle, WA.

(a) *Regulated areas.* The following areas are regulated navigation areas:

(1) All waters inside an area beginning at a point on the shore at 47°35' 02.7" N 122°22'23.00" W; thence north to 47°35'26.00" N 122°22'23.00" W; thence east to 47°35'26.00" N 122°21'52.50" W; thence south to 47°35'10.80" N 122°21'52.50" W; thence southwest to a point on the shoreline at 47°35'05.9" N 122°21'58.00" W. [Datum: NAD 1983].

(2) All waters inside an area beginning at 47°34' 52.16" N 122°21'27.11" W; thence to 47°34' 53.46" N 122°21'30.42" W; thence to 47°34' 37.92" N 122°21'30.51" W; thence to 47°34' 37.92" N 122°21'27.65" W. [Datum: NAD 1983].

(b) *Regulations.* (1) All vessels and persons are prohibited from activities that would disturb the seabed, such as anchoring, dragging, trawling, spudding, or other activities that involve disrupting the integrity of the sediment caps installed in the designated regulated navigation area, pursuant to the remediation efforts of the U.S. Environmental Protection Agency (EPA) and others in the Pacific Sound Resources and Lockheed Shipyard EPA superfund sites. Vessels may otherwise transit or navigate within this area without reservation.

(2) The prohibition described in paragraph (b)(1) of this section does not apply to vessels or persons engaged in activities associated with remediation efforts in the superfund sites, provided that the Captain of the Port, Puget Sound (COTP), is given advance notice of those activities by the EPA.

(3) Nothing in this section is intended to conflict with treaty fishing rights of the Muckleshoot and Suquamish tribes, and they are not restricted from any type of fishing in the described area.

(c) *Waivers.* Upon written request stating the need and proposed conditions of the waiver, and any proposed precautionary measures, the COTP may authorize a waiver from this section if the COTP determines that the activity for which the waiver is sought can take place without undue risk to the remediation efforts described in paragraph (b)(1) of this section. The COTP will consult with EPA in making this determination when necessary and practicable.

§ 165.1339 Safety Zone; Coast Guard Exercise Area, Hood Canal, Washington.

(a) *Location.* The following area is a safety zone: All waters encompassed within 500 yards of any vessel that is involved in a Coast Guard training exercise while such vessel is transiting Hood Canal, WA between Foul Weather Bluff and the entrance to Dabob Bay. Vessels involved will be various sizes and can be identified as those flying the Coast Guard Ensign.

(b) *Regulations.* In accordance with the general regulations in 33 CFR Part 165, Subpart C, no person may enter or remain in the safety zone created in this rule unless authorized by the Captain of the Port or a Designated Representative. See 33 CFR Part 165, Subpart C, for additional information and requirements. Vessel operators wishing to enter the zone during the enforcement period must request permission for entry by contacting the on-scene patrol commander on VHF channel 13 or 16, or the Sector Puget Sound Joint Harbor Operations Center at (206) 217-6001.

(c) *Definition.* Training exercises are defined as full scale exercises that are significant in nature and involve multiple units and vessels. This safety zone will not be utilized by operations and training which is conducted daily or is routine in nature.

(d) *Enforcement period.* The safety zone described in paragraph (a) of this section would be enforced by the Captain of the Port only upon notice. Notice of enforcement by the Captain of the Port will be provided 45 days prior to execution of the exercise by all appropriate means, in accordance with 33 CFR 165.7(a). Such means will include publication in the FEDERAL REGISTER, and may also include Broadcast Notice to Mariners, Local Notice to Mariners, or both.

Subpart G—Protection of Naval Vessels

§ 165.2010 Purpose.

This subpart establishes the geographic parameters of naval vessel protection zones surrounding U.S. naval vessels in the navigable waters of the United States. This subpart also establishes when the U.S. Navy will take enforcement action in accordance with the statutory guidelines of 14 U.S.C. 91. Nothing in the rules and regulations contained in this subpart shall relieve any vessel, including U.S. naval vessels, from the observance of the Navigation Rules. The rules and regulations contained in this subpart supplement, but do not replace or supercede, any other regulation pertaining to the safety or security of U.S. naval vessels.

§ 165.2015 Definitions.

The following definitions apply to this subpart:

Atlantic Area means that area described in 33 CFR 3.04–1 Atlantic Area.

Large U.S. naval vessel means any U.S. naval vessel greater than 100 feet in length overall.

Naval defensive sea area means those areas described in 32 CFR part 761.

Naval vessel protection zone is a 500-yard regulated area of water surrounding large U.S. naval vessels that is necessary to provide for the safety or security of these U.S. naval vessels.

Navigable waters of the United States means those waters defined as such in 33 CFR part 2.

Navigation rules means the Navigation Rules, International-Inland.

Official patrol means those personnel designated and supervised by a senior naval officer present in command and tasked to monitor a naval vessel protection zone, permit entry into the zone, give legally enforceable orders to persons or vessels within the zone, and take other actions authorized by the U.S. Navy.

Pacific Area means that area described in 33 CFR 3.04–3 Pacific Area.

Restricted area means those areas established by the Army Corps of Engineers and set out in 33 CFR part 334.

Senior naval officer present in command is, unless otherwise designated by competent authority, the senior line officer of the U.S. Navy on active duty, eligible for command at sea, who is present and in command of any part of the Department of Navy in the area.

U.S. naval vessel means any vessel owned, operated, chartered, or leased by the U.S. Navy; any pre-commissioned vessel under construction for the U.S. Navy, once launched into the water; and any vessel under the operational control of the U.S. Navy or a Combatant Command.

Vessel means every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water, except U.S. Coast Guard or U.S. naval vessels.

§ 165.2020 Enforcement authority.

- (a) Coast Guard. Any Coast Guard commissioned, warrant or petty officer may enforce the rules and regulations contained in this subpart.
- (b) Senior naval officer present in command. In the navigable waters of the United States, when immediate action is required and representatives of the Coast Guard are not present or not present in sufficient force to exercise effective control in the vicinity of large U.S. naval vessels, the senior naval officer present in command is responsible for the enforcement of the rules and regulations contained in this subpart to ensure the safety and security of all large naval vessels present. In meeting this responsibility, the senior naval

officer present in command may directly assist any Coast Guard enforcement personnel who are present.

165.2030 Pacific Area

- (a) This section applies to any vessel or person in the navigable waters of the United States within the boundaries of the U.S. Coast Guard Pacific Area, which includes the Eleventh, Thirteenth, Fourteenth, and Seventeenth U.S. Coast Guard Districts.:

Note to paragraph(a): The boundaries of the U.S. Coast Guard Pacific Area and the Eleventh, Thirteenth, Fourteenth, and Seventeenth U.S. Coast Guard Districts are set out in 33 CFR part 3.

- (b) A naval vessel protection zone exists around U.S. naval vessels greater than 100 feet in length overall at all times in the navigable waters of the United States, whether the large U.S. naval vessel is underway, anchored, moored, or within a floating dry dock, except when the large naval vessel is moored or anchored within a restricted area or within a naval defensive sea area.
- (c) The Navigation Rules shall apply at all times within a naval vessel protection zone.
- (d) When within a naval vessel protection zone, all vessels shall operate at the minimum speed necessary to maintain a safe course, unless required to maintain speed by the Navigation Rules, and shall proceed as directed by the Coast Guard, the senior naval officer present in command, or the official patrol. When within a naval vessel protection zone, no vessel or person is allowed within 100 yards of a large U.S. naval vessel unless authorized by the Coast Guard, the senior naval officer present in command, or official patrol.
- (e) To request authorization to operate within 100 yards of a large U.S. naval vessel, contact the Coast Guard, the senior naval officer present in command, or the official patrol on VHF-FM channel 16.
- (f) When conditions permit, the Coast Guard, senior naval officer present in command, or the official patrol should:
- (1) Give advance notice on VHF-FM channel 16 of all large U.S. naval vessel movements;
 - (2) Permit vessels constrained by their navigational draft or restricted in their ability to maneuver to pass within 100 yards of a large U.S. naval vessel in order to ensure a safe passage in accordance with the Navigation Rules; and
 - (3) Permit commercial vessels anchored in a designated anchorage area to remain at anchor when within 100 yards of passing large U.S. naval vessels; and
 - (4) Permit vessels that must transit via a navigable channel or waterway to pass within 100 yards of a moored or anchored large U.S. naval vessel with minimal delay consistent with security.

Note to paragraph(f): The listed actions are discretionary and do not create any additional right to appeal or otherwise dispute a decision of the Coast Guard, the senior naval officer present in command, or the official patrol.

Section 4

IMO RULE 10 TRAFFIC SEPARATION SCHEMES (International)

SPEED AND WAKE CONTROL (Shipping - 46 USC Section 2302)

ANCHORAGES AND RESERVATIONS

IMO RULE 10 - TRAFFIC SEPARATION SCHEMES (International)

- (a) This Rule applies to traffic separation schemes adopted by the Organization [Intl] and does not relieve any vessel of her obligation under any other rule.
- (b) A vessel using a traffic separation scheme shall:
 - i. Proceed in the appropriate traffic lane in the general direction of traffic flow for that lane.
 - ii. So far as is practicable keep clear of a traffic separation line or separation zone.
 - iii. Normally join or leave a traffic lane at the termination of the lane, but when joining or leaving from either side shall do so at as small an angle to the general direction of traffic flow as practicable.
- (c) A vessel, shall so far as practicable, avoid crossing traffic lanes but if obliged to do so shall cross on a heading as nearly as practicable at right angles to the general direction of traffic flow.
- (d)
 - i. A vessel shall not use an inshore traffic zone when she can safely use the appropriate traffic lane within the adjacent traffic separation scheme. However, vessels of less than 20 meters in length, sailing vessels and vessels engaged in fishing may use the inshore traffic zone.
 - ii. Notwithstanding subparagraph (d)(i), a vessel may use an inshore traffic zone when en route to or from a port, offshore installation or structure, pilot station or any other place situated within the inshore traffic zone, or to avoid immediate danger.
- (e) A vessel, other than a crossing vessel or a vessel joining or leaving a lane shall not normally enter a separation zone or cross a separation line except:
 - i. in cases of emergency to avoid immediate danger;
 - ii. to engage in fishing within a separation zone.
- (f) A vessel navigating in areas near the terminations of traffic separation schemes shall do so with particular caution.
- (g) A vessel shall so far as practicable avoid anchoring in a traffic separation scheme or in areas near its terminations.

- (h) A vessel not using a traffic separating scheme shall avoid it by as wide a margin as is practicable.
- (i) A vessel engaged in fishing shall not impede the passage of any vessel following a traffic lane.
- (j) A vessel of less than 20 meters in length or a sailing vessel shall not impede the safe passage of a power-driven vessel following a traffic lane.

Note: “Shall Not Impede” means a vessel MUST NOT navigate in such a way as to risk the development of a collision with another vessel (i.e. when a power driven vessel following a TSS is forced to make an unusual or dangerous maneuver in order to avoid one of the vessels listed above, then the vessel following the TSS has been impeded).

- (k) A vessel restricted in her ability to maneuver when engaged in an operation for the maintenance of safety of navigation in a traffic separation scheme is exempted from complying with this Rule to the extent necessary to carry out the operation.
- (l) A vessel restricted in her ability to maneuver when engaged in an operation for the laying, servicing or picking up of a submarine cable, within a traffic separation scheme, is exempted from complying with this Rule to the extent necessary to carry out the operation.

Speed and Wake Control

Shipping - 46 USC Section 2302

- (a) A person operating a vessel in a negligent manner or interfering with the safe operation of a vessel, so as to endanger the life, limb, or property of a person is liable to the United States Government for a civil penalty of not more than \$5,000 in the case of a recreational vessel, or \$25,000 in the case of any other vessel.
- (b) A person operating a vessel in a grossly negligent manner that endangers the life, limb, or property of a person commits a class "A" misdemeanor.
- (c) An individual who is under the influence of alcohol, or a dangerous drug in violation of a law of the United States when operating a vessel, as determined under standards prescribed by the Secretary by regulation -
 - (1) is liable to the United States Government for a civil penalty of not more than \$5,500
 - (2) commits a class "A" misdemeanor.

Note: Each vessel operator is responsible for operating their vessel at a safe speed, especially in reduced visibility, and for the wake created by their vessel. When a tide exceeds a stage of 11.0 feet at Seattle, there is an increased risk of vessel wakes endangering persons and/or property along the shoreline within the VTS Area. All vessels operating within the VTS Area should proceed at a speed that will minimize the risk of wake damage while maintaining the ability to maneuver safely.

The VTS will begin tidal advisory broadcasts 30 minutes before the tide is predicted to exceed 11.0 feet in Seattle. This advisory will be re-broadcast every 30 minutes until the tidal state has subsided.

Anchorage and Reservations

VTS Puget Sound manages the general anchorage areas within the VTS Area on behalf of the Captain of the Port (COTP). General Anchorages are intended for use by commercial deep draft vessels over 200 feet in length. This includes the Articulated and Integrated Tug Barge combinations. Each vessel described above anchoring outside an established general anchorage shall immediately notify the COTP of their position and reason for anchoring.

Except with the prior approval of the COTP, or, in the case of an emergency, with approval of the COTP immediately subsequent to anchoring, no commercial vessel greater than 1600 gross tons may anchor in any anchorage unless it maintains the capability to get underway within 30 minutes. Any vessel unable to meet this requirement must immediately notify the COTP and make arrangements for an adequate number of tugs to respond to the vessel within 30 minutes notice.

No vessel may anchor in a “dead ship” status (propulsion or control unavailable for normal operations) at any anchorage without prior approval by the COTP.

No vessel in a condition such that it is likely to sink or otherwise become a menace or obstruction to the navigation or anchorage of other vessels shall occupy any general anchorage except in an emergency and then only for such period as may be permitted by the COTP.

All anchored vessels are encouraged to comply with the Anchoring Standard of Care, which may be found in the Puget Sound Harbor Safety Plan www.PSHSC.org. Vessels unable to comply with these requirements must immediately notify VTS Puget Sound. In such case, the COTP may require the vessel to have one or more tugs standing by to render immediate assistance. VTS will contact each anchored vessel to ensure that they are maintaining a live radio watch on the VTS working frequency during heavy weather conditions.

The VTS will monitor each vessel at anchor, in case U. S. Coast Guard intervention is necessary to ensure safety. VTS actions may include directing vessels to anchor or raise anchor, seek sheltered areas, increase position reporting requirements, require stand-by tugs, and/or control vessel movements to mitigate the threats posed by heavy weather.

VTS provides an anchorage reservation service which is intended to reduce the risk of overcrowding while maintaining maximum usage of each anchorage in a fair and orderly manner. A table listing the maximum number of vessels and duration for each anchorage can be found in this section, and is also accessible at www.uscg.mil/d13/psvts. No vessel shall occupy a general anchorage for a period longer than 30 days unless authorization is received from the COTP. Reservations should typically be made at least 48 hours prior to the ship’s arrival by the agent or master calling VTS Puget Sound in Seattle, Washington at 206-217-6152. Tugs using the tug and barge areas are exempt from the reservation requirement.

Each general anchorage may be reserved on a competitive "first come, first served" basis. To allow a more efficient and fair allocation of available space, we ask that:

- (1) A reservation may be made as far in advance of arrival as possible. A reservation shall be for no longer than the maximum allowable stay assigned to the anchorage area. Multiple reservations for an individual vessel in an anchorage area will not be accepted, unless the anchorage will be vacated, returned to, and ultimately vacated within the maximum allowable duration of a single anchorage stay. Once a reservation time is agreed and set, all other time slots become available to others.
- (2) A vessel must heave anchor and depart upon expiration of their reservation. Shortening the duration of an anchorage stay is never a problem, however, all revisions of ETA's and ETD's (estimated time of departure) shall be reported as soon as changes become known, to maximize the availability of the anchorage to others.
- (3) Extending the maximum allowable stay for a vessel in an anchorage area requires COTP approval through the Vessel Traffic Center Watch Supervisor and VTS Director. An extension request may be denied if another competing reservation exists, and if an extension is granted, it may be granted with caveats that it could be revoked by direction of the COTP depending on port loading.
- (4) Anchorage reservations may not be accepted in high usage areas, such as Port Angeles, Anacortes, Vendovi, and Elliott Bay/Smith Cove (Seattle) if there is a possibility of delay due to uncertain sailing orders.

PUGET SOUND ANCHORAGES - Quick Reference Sheet

All Puget Sound anchorage areas are managed on behalf of the Captain of the Port by the Puget Sound Vessel Traffic Service. The number of vessels and maximum stay durations are based on policy set by the Captain of the Port.

GENERAL ANCHORAGES	ABBREVIATIONS	NUMBER OF VESSELS	MAX STAY
Elliott Bay East	EBE	1	3 days
Elliott Bay West	EBW	1	10 days
Smith Cove East	SCE	1	10 days
Smith Cove West (Apr through Sep)	SCW	3	30 days
Smith Cove West (Oct through Mar)	SCW	3	10 days
Yukon Harbor	YH	6	30 days
Commencement Bay	COM	5	30 days
Port Gardner	PG	2	30 days
Holmes Harbor	HH	6	30 days
Bellingham Bay	BB	6	30 days
Cherry Point	CP	1	30 days
Anacortes West	ANW	1	6 days
Anacortes Central	ANC	1	10 days
Anacortes East	ANE	1	10 days
SPECIAL ANCHORAGES			
Port Townsend Foul Weather Explosives	PTX1	1	3 days
Port Townsend Fair Weather Explosives	PTX2	1	10 days
Bellingham Bay Explosives	BBX	1	10 days
Thorndike Bay Emergency Explosives	TBX	1	3 days
Freshwater Bay Emergency	FBX	2	1 day
NON-DESIGNATED ANCHORAGES

Section 5

VHF Frequency Monitoring Areas

Ferry Crossing Routes

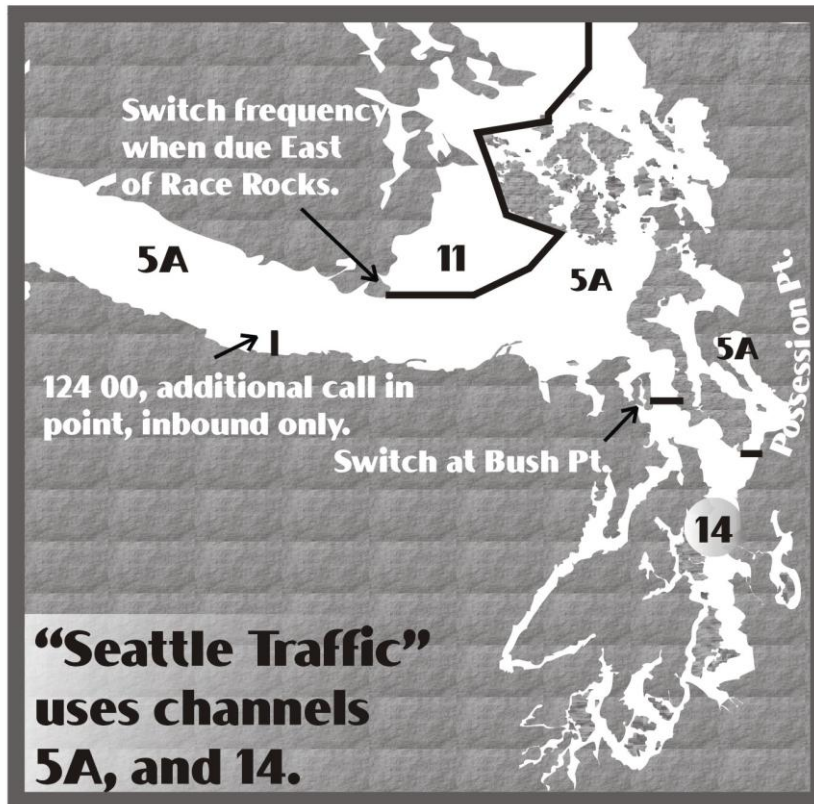

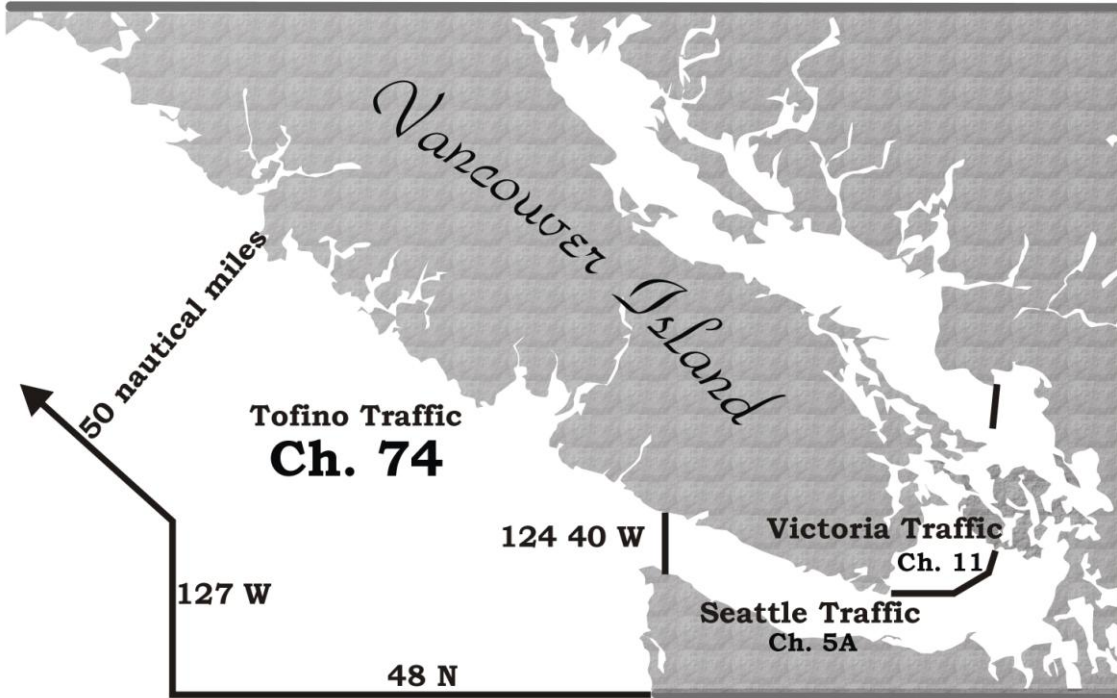

Commercial Salmon Management & Catch Reporting Areas

Cooperative Vessel Traffic Service (CVTS) Advance Report & Reporting Area

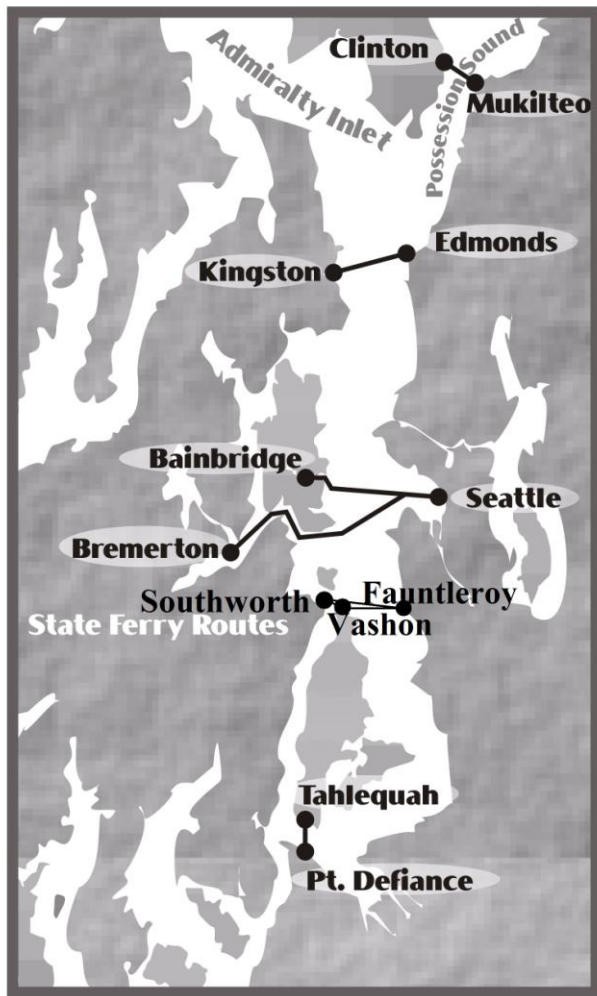

Message Markers and SMCP

IMO Area To Be Avoided off the Washington Coast

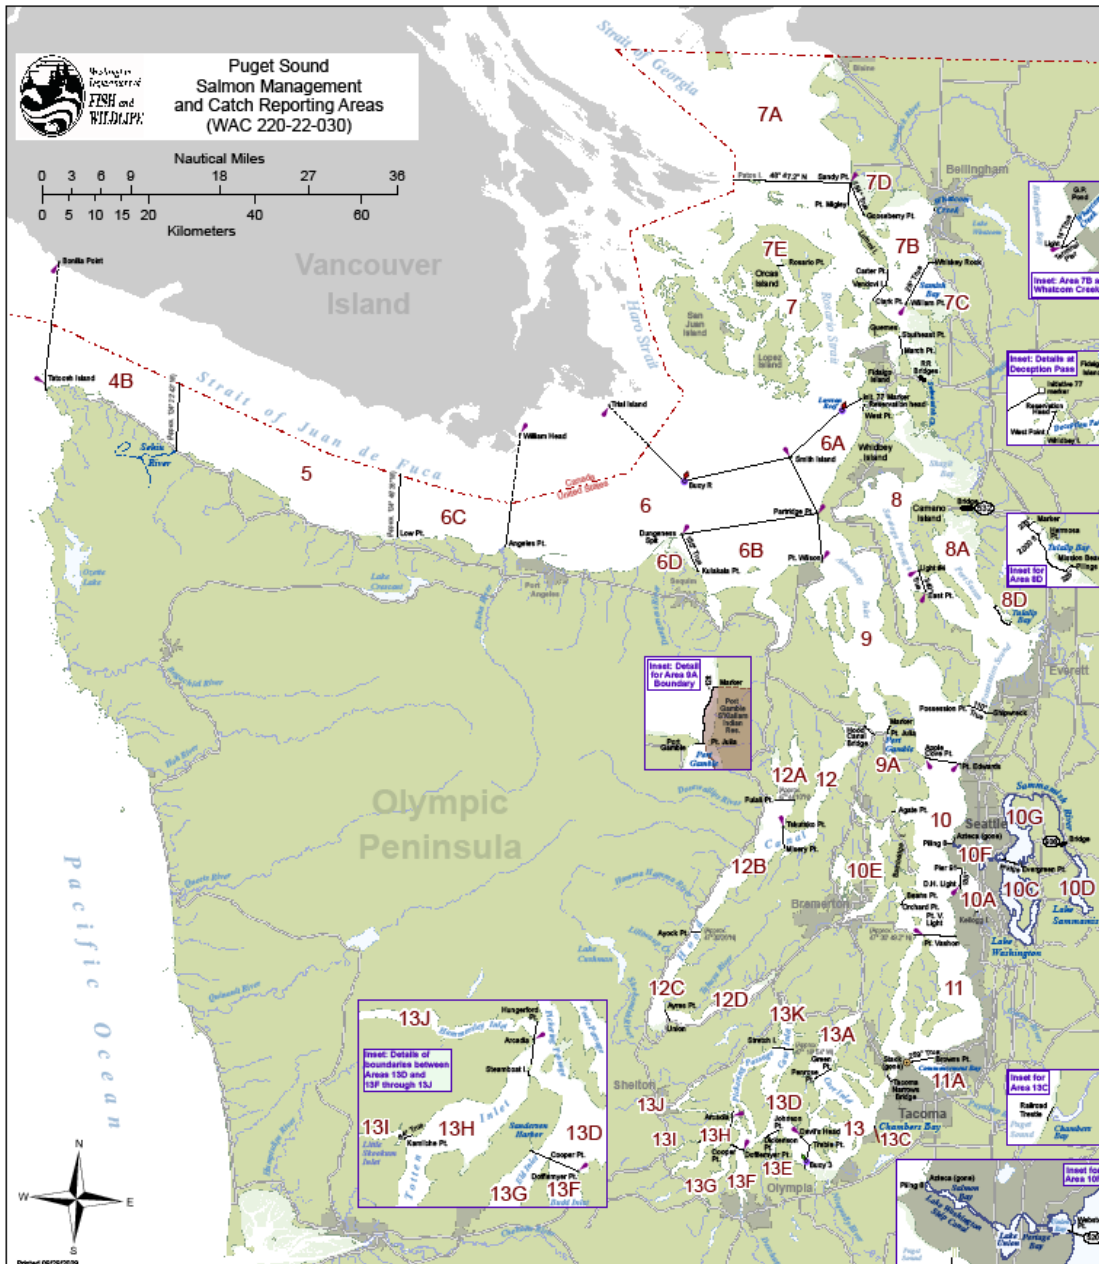

Puget Sound Area Security Zones

VHF Frequency Monitoring Areas

Ferry Crossing Routes

Commercial Salmon Management and Catch Reporting Areas

Treaty all-gear fishing, including the use of set-nets, may be encountered in all areas throughout the entire year. Areas 4B, 5, 6C, 10A, 10F and 11A are often open for long periods and may be congested. Navigate with extreme caution and report any unattended nets to VTS

Commercial salmon gillnet fishing is most prevalent in the autumn in areas 7, 7A, 7B, 8A, 9, 10 and 11. Special navigation requirements may be enacted by VTS depending on the level of vessel congestion.

Sport recreational fishing is common throughout the entire Puget Sound region. Concentrations historically occur in the western Strait of Juan de Fuca in the vicinity of Neah Bay and Clallam Bay, Port Angeles, Dungeness, Partridge Bank to Marrowstone Island, Point No Point, Jefferson Head, Shilshole, Elliott Bay, Des Moines to Point Robinson, and Commencement Bay.

Message Markers, SMCP and English Language

Message Markers:

When language problems arise, communications may be preceded by the following message markers:

- Questions: request for information. “*Question, what is your pilot station time, over?*”
- Answer: the reply to a previous question. “*Answer, fourteen-thirty, over.*”
- Request: a request for action from others with respect to the ship.
- Information: observed facts.
- Intention: notice of immediate planned navigational actions.
- Warning: information about dangers.
- Advice: a recommendation to correct a hazardous condition.
- Instruction: a lawful order
- Clearance: an authorization to proceed subject to conditions.

Standard Marine Communication Phrases:

As navigational and safety communications must be precise, simple and unambiguous, so as to avoid confusion and error, there is a need to standardize the language used. When transmitting intentions in English over the radio to Tofino, Seattle, or Victoria Traffic, where precision in English may be of concern, vessels should use the Standard Marine Communication Phrases of the Marine National Vocabulary available from the IMO.

English Language:

The language normally used on board a ship is the national language of the crew. However, crews of ships trading internationally must necessarily conduct navigational and safety communications with persons who may be unable to understand their national language. All communications with Tofino, Seattle or Victoria Traffic must be made in clear, unbroken English. At least one person capable of conducting two-way radio communication using the English language must be present on the bridge at all times within the CVTS area. ([Back to TOC](#))

Why does the IMO establish ATBAs?

- The IMO establishes ATBAs in defined areas where navigation is very hazardous or where it is important to avoid casualties.

Why is it important for vessels to remain offshore and avoid this area?

- Reduces risk of vessel grounding on shore
- Reduces risk of collision with small vessels traveling close to shore
- Allows more time for assistance to arrive to help a disabled vessel
- Increases protection of coastal resources
- In the event of an oil spill:
 - Allows more time for spill cleanup and containment crews to arrive
 - Decreases the chance of spill impacts on the shoreline
 - Increases spill evaporation and degradation time

How were the boundaries of the ATBA chosen?

- The boundaries were chosen to protect Sanctuary resources most at risk from vessel casualties.
- The boundaries are compatible with the Traffic Separation Scheme

How was the vessel applicability chosen for the ATBA?

- Vessels greater than 400 gross tons were selected because of the substantial amount of bunker fuel that they carry and the risk that a spill would pose to sanctuary resources
- Vessels that carry oil or hazardous materials in bulk as cargo or cargo residue were selected due to the risk that a spill would pose to sanctuary resources
- The ATBA applies to vessels solely in transit and does not apply to vessels engaged in activities otherwise allowed in the sanctuary, such as fishing and research. The ATBA also does not apply to government vessels, although they are encouraged to avoid the area when solely in transit.

Natural characteristics of the Olympic Coast National Marine Sanctuary:

- 128 species of seabirds within the Sanctuary
- 29 species of whales, dolphins, and other marine mammals reside or visit the area
- Washington State's only sea otter population
- Many species of fish and shellfish harvested for commercial, subsistence or recreational purposes
- Over 300 species of resident intertidal invertebrates, aquatic plants, and fish
- Diverse habitat types supporting complex food chains, including kelp communities, rocky intertidal zones, sand beaches, and offshore rocks
- Within the usual and accustomed fishing grounds of the Hoh, Makah, Quileute tribes and the Quinault Indian Nation
- Adjacent to Olympic National Park, Washington Islands National Wildlife Refuges, and Washington State Seashore Conservation Area

Puget Sound Area Security Zones Entry Prohibited!

Security Zones For Large Passenger Vessels & Tank Ships; Naval Vessel Protection Zones:

Keep your distance from all U.S. Naval Vessels, Washington State Ferries, Cruise Ships, Other Large Passenger Vessels & Tank Ships:

- Do not approach within 100 Yards.
- Slow to minimum Speed within 500 Yards.
- When a Ferry or Cruise Ship is moored do not approach within 25 Yards.
- Violators of these zones face up to 6 years in prison and a \$250,000 fine.

The United States Coast Guard
Marine Safety Manual
Volume III: Marine Industry
Personnel

COMDTINST 16000.8B Change 2

otherwise, this Commandant Change Notice is effective as of the date of publication. Any discrepancies with vessel manning or endorsements should be brought to the attention of the owner/operator or Officer in Charge, Marine Inspection (OCMI) and discussed during the next scheduled Coast Guard attendance with a view of aligning with this revised guidance.

5. DISCLAIMER. This guidance is not a substitute for applicable legal requirements, nor is it itself a rule. It is not intended to nor does it impose legally binding requirements on any party. It represents the Coast Guard's current thinking on this topic and may assist industry, mariners, the general public, and the Coast Guard, as well as other Federal and State regulators, in applying statutory and regulatory requirements. Members of the public may use an alternative approach if the approach satisfies the requirements of the applicable statutes and regulations.
6. MAJOR CHANGES. All changes are underlined in the final version and each changed page is annotated with CH-2 in the footer. For a summary of all of the changes, as well as to view any associated documents, go to <http://www.regulations.gov>, using "USCG-2016-0669" as the search term. Available for viewing in the public docket is a change matrix that provides a summary of each specific public comment and the corresponding Coast Guard response; the change matrix also lists and explains changes made by the Coast Guard but not prompted by public comments. Substantive changes to Part B and Part C of this Manual include:
 - a. Updated provisions to align with the Howard Coble Coast Guard and Maritime Transportation Act of 2014 Pub. L. 113-281; Sections 316, 319, and 601. Specifically, Section 316 made statutory changes which amended multiple paragraphs of 46 U.S.C. 8104. Section 319 amended 46 U.S.C. 4105 and Section 601 amended the 46 U.S.C. 8103 note.
 - b. Incorporates updated information on riding gangs, 46 U.S.C. 8106. Chapter B1, Section J.
 - c. Incorporates Guidelines for Liquefied Natural Gas Fuel Transfer Operations and Training of Personnel on Vessels Using Natural Gas as Fuel, by reference. Chapter B2, Section A.
 - d. Corrects a longstanding discrepancy between in the Tables of Additional Deckhands for small passenger vessels and the regulatory breakpoints established in 46 CFR Subchapters T and K. The tables have been adjusted to align with the regulatory breakpoints as well as the base thresholds originally established in the 1955 Merchant Marine Safety Manual (CG-203), per amendment #26 of 1973. Chapter B2, Sections C & D.
 - e. Updated policy reflecting the regulations for Offshore Supply Vessels of at Least 6,000 GT ITC (79 FR 48894, August 18, 2014)]. Chapter B2, Section L.
 - f. Consolidates hydrofoils under a single header and incorporates High-Speed Craft. Chapter B2, Section T.
 - g. Having considered the recommendations of the Towing Safety Advisory Committee (TSAC), Tasks 13-02 and 15-01, the Coast Guard has included manning scales for towing vessels inspected under 46 CFR Subchapter M, which comply with the current provisions of Title 46, U.S. Code (U.S.C.) Subtitle II, Part F. This includes scales for towing vessels of 300 GRT or

more exclusively in Great Lakes service, which were not included in the TSAC recommendation. The scales are presented in a new standard format. Chapter B2, Section W.

- h. Adds a figure for Tonnage Applicability: Dual-Tonnage Vessels. Chapter B3, Section B.
- i. Clarifies the Federal and First-Class Pilot requirements. Chapter B3, Section I.
- j. Adds clarification for Person in Charge of Medical Care. Chapter B3, Section Q.
- k. Adds discussion on Port Relief Officers. Chapter B3, Section R.
- l. Adds considerations for the assignment of Able Seamen (ABs) on vessels of limited size. Chapter B4, Section D.
- m. Includes a section on Cadets, Student Observers & Apprentices. Chapter B4, Section G.
- n. Revisions for the International Safety Management (ISM) Code, as amended by IMO Resolution MSC.353(92). Chapter B5, Section F.
- o. Created Sample Reduced Scales for certain vessels with automated engineering systems. Chapter B6, Section A.
- p. Adds an Abbreviations section, Suggested Manning Proposal Template, MMS Work Instruction, Master's Field Guide, and a Manning Verification Check-sheet.

7. ENVIRONMENTAL ASPECT AND IMPACT CONSIDERATIONS.

- a. The development of this Commandant Change Notice and the general policies contained within it have been thoroughly reviewed by the originating office in conjunction with the Office of Environmental Management, and are categorically excluded (CE) under current USCG CE # 33 from further environmental analysis, in accordance with Section 2.B.2. and Figure 2-1 of the National Environmental Policy Act Implementing Procedures and Policy for Considering Environmental Impacts, COMDTINST M16475.1 (series). Because this Commandant Change Notice contains guidance on, and provisions for, compliance with applicable environmental mandates, Coast Guard categorical exclusion #33 is appropriate.
- b. This directive will not have any of the following: significant cumulative impacts on the human environment; substantial controversy or substantial change to existing environmental conditions; or inconsistencies with any Federal, State, or local laws or administrative determinations relating to the environment. All future specific actions resulting from the general policies in this Commandant Change Notice must be individually evaluated for compliance with the National Environmental Policy Act (NEPA), DHS and Coast Guard NEPA policy, and compliance with all other environmental mandates. Due to the administrative and procedural nature of this Commandant Change Notice, and the environmental guidance provided within it for compliance with all applicable environmental laws prior to promulgating any directive, all applicable environmental considerations are addressed appropriately in this Commandant Change Notice.

8. **DISTRIBUTION.** No paper distribution will be made of this Commandant Change Notice. An electronic version will be located on the following Commandant (CG-612) web sites. Internet: <http://www.dcms.uscg.mil/Our-Organization/Assistant-Commandant-for-C4IT-CG-6-/The-Office-of-Information-Management-CG-61/aboutCGDS/> , and CGPortal: <https://cgportal2.uscg.mil/library/directives/SitePages/Home.aspx>.

9. **PROCEDURE.** Remove and replace the following sections of The Marine Safety Manual, Volume III, Marine Industry Personnel, COMDTINST M16000.8B:

Remove	Replace
Forward	Forward
Contents IV-X	Contents IV-X
Chapters B1-B7	Chapters B1-B7
Chapter C1-C2	Chapter C1-C2
LIF-i	LIF-i & ABB-i-ii
ANNEX	ANNEX

10. **RECORDS MANAGEMENT CONSIDERATIONS.** This Commandant Change Notice has been thoroughly reviewed during the directives clearance process, and it has been determined there are further records scheduling requirements, in accordance with Federal Records Act, 44 U.S.C. 3101 et seq., NARA requirements, and Information and Life Cycle Management Manual, COMDTINST M5212.12 (series). This policy does not create significant or substantial change to existing records management requirements.

11. **FORMS/REPORTS.** The forms referenced in this Manual are available in USCG Electronic Forms on the Standard Workstation or on CG Portal <https://cgportal2.uscg.mil/delivery/Satellite/CG611/FORMS> and Intranet at <http://www.dcms.uscg.mil/Our-Organization/Assistant-Commandant-for-C4IT-CG-6-/The-Office-of-Information-Management-CG-61/aboutFormsManagement/>.

12. **REQUEST FOR CHANGES.** Units and individuals may recommend changes via the chain of command to: CG-CVC-1@uscg.mil.

P. F. THOMAS /s/
 Rear Admiral, U.S. Coast Guard
 Assistant Commandant for Prevention Policy

announcing the availability of the changes to Part B (legacy chapters 20 – 26) and requested public comments (See 78 FR 48696 and 79 FR 14714) as well as input from the Merchant Marine Personnel Advisory Committee. The final Notice of Availability, including comments and material received from the public, as well as documents mentioned as being available in the docket, are part of docket USCG-2013-0240. Unless specifically stated otherwise, this Commandant Change Notice is effective as of the date of publication. Any discrepancies with vessel manning or endorsements should be brought to the attention of the owner/operator or Officer in Charge, Marine Inspection (OCMI) and discussed during the next scheduled Coast Guard attendance with a view of aligning with this revised guidance.

5. DISCLAIMER. This guidance is not a substitute for applicable legal requirements, nor is it itself a rule. It is not intended to nor does it impose legally binding requirements on any party. It represents the Coast Guard's current thinking on this topic and may assist industry, mariners, the general public, and the Coast Guard, as well as other Federal and State regulators, in applying statutory and regulatory requirements. Members of the public may use an alternative approach if the approach satisfies the requirements of the applicable statutes and regulations.
6. MAJOR CHANGES. This Change is presented in a new format, to facilitate future revisions by creating three distinct parts; Part A: Mariner Credentialing (Chapters 1-17), Part B: Vessel Manning (legacy Chapters 20-26, now Chapters 1-7), and Part C: Shipment and Service (legacy Chapters 18-19, now Chapters 1-2). This Change includes revisions to Part C, Chapters 1 and 2, to account for revised regulations, updated CG-Forms, and reformatting. Substantive changes to Part B, Chapters 1-7, of this Manual include:
 - a. Full alignment with Deputy Commandant for Operations Organization 3.0 for clarity of roles and responsibilities and facilitation of communications with appropriate offices in Headquarters.
 - b. Updated general provisions for vessel manning, including guidance for the issuance of safe manning documents.
 - c. Incorporates updated information on the Global Maritime Distress and Safety System (GMDSS).
 - d. Revised discussion on the impact of multiple international standards, including; the Officer's Competency Certificates Convention (OCCC) 1936, the International Convention for Safety of Life at Sea (SOLAS), and the Principles of Minimum Safe Manning (IMO Resolution A.1047(27)).
 - e. Clarification on the applicability of tonnage measurement systems to U.S. flag vessels.
 - f. Changes resulting from the consolidation of merchant mariner qualification credentials, including the removal of references to the operator uninspected towing vessel (OUTV) endorsement.

- g. Context on the allowable employment and conditions of a two-watch system for specific vessel types.
- h. Updated policy reflecting the regulations for the Implementation of the 2010 Amendments to the International Convention on Standards of Training, Certification and Watchkeeping for Seafarers, 1978, (STCW) and Changes to National Endorsements (78 FR 1625-AA16, 247 [December 24, 2013]).

7. ENVIRONMENTAL ASPECT AND IMPACT CONSIDERATIONS.

- a. The development of this Commandant Change Notice and the general policies contained within it have been thoroughly reviewed by the originating office in conjunction with the Office of Environmental Management, and are categorically excluded (CE) under current USCG CE # 33 from further environmental analysis, in accordance with Section 2.B.2. and Figure 2-1 of the National Environmental Policy Act Implementing Procedures and Policy for Considering Environmental Impacts, COMDTINST M16475.1 (series). Because this Commandant Change Notice contains guidance on, and provisions for, compliance with applicable environmental mandates, Coast Guard categorical exclusion #33 is appropriate.
 - b. This directive will not have any of the following: significant cumulative impacts on the human environment; substantial controversy or substantial change to existing environmental conditions; or inconsistencies with any Federal, State, or local laws or administrative determinations relating to the environment. All future specific actions resulting from the general policies in this Commandant Change Notice must be individually evaluated for compliance with the National Environmental Policy Act (NEPA), DHS and Coast Guard NEPA policy, and compliance with all other environmental mandates. Due to the administrative and procedural nature of this Commandant Change Notice, and the environmental guidance provided within it for compliance with all applicable environmental laws prior to promulgating any directive, all applicable environmental considerations are addressed appropriately in this Commandant Change Notice.
8. DISTRIBUTION. No paper distribution will be made of this Commandant Change Notice. An electronic version will be located on the following Commandant (CG-612) web sites. Internet: <http://www.uscg.mil/directives/>, and CGPortal: <https://cgportal2.uscg.mil/library/directives/SitePages/Home.aspx>.
9. PROCEDURE. Remove and replace the following sections of The Marine Safety Manual, Volume III, Marine Industry Personnel, COMDTINST M16000.8B:

Remove	Replace
Contents IV-VII	Contents IV-VII
Chapters 18-19	Chapters C1-C2
Chapters 20-26	Chapters B1-B7
List of Figures F-i	List of Figures LIF-i

COMMANDANT INSTRUCTION M16000.8B

Subj: MARINE SAFETY MANUAL, VOLUME III, MARINE INDUSTRY PERSONNEL

1. PURPOSE: This Manual provides information and Marine Safety program interpretations on international conventions and U.S. statutory and regulatory issues relating to marine industry personnel.
2. ACTION. Area and district commanders, commanders of maintenance and logistics commands, commanding officers of headquarters units, assistant commandants for directorates, Chief Counsel, and specialty staff offices at Headquarters shall ensure that personnel responsible for activities related to marine industry personnel are familiar with and guided by the provisions of this manual.
3. DIRECTIVES AFFECTED. Marine Safety Manual, Volume III, Marine Industry Personnel, COMDTINST M16000.8A dated 25 March 1997, and NMC Policy Letter 5-98 are hereby canceled.
4. DISCUSSION. This revision of Volume III of the Marine Safety Manual incorporates editorial changes resulting from the reorganization of the Mariner Licensing and Documentation Program at the headquarters level. Subsequent to the last revision, the staff and responsibilities of Commandant, G-MOC-1, were transferred to the National Maritime Center. Also incorporated are the Policy changes resulting from the 1998 Regional Examination Center Conference and significant revisions to guidance on approved course management (Chapter 7) and conduct of examinations (Chapter 5).
5. FORMS AVAILABILITY. See list of forms, Table Of Contents, page VII.

FOREWORD

The United States Coast Guard (USCG) is the nation's lead federal agency charged with the superintendence of the U.S. Merchant Marine and steward for associated International Conventions. In executing these responsibilities, the USCG prescribes regulations and develops policy to ensure that inspected and certain uninspected vessels are safely manned with qualified and competent mariners. The specific statutory basis for this charge is rooted in Title 46, U.S. Code (U.S.C.) Subtitle II, specifically § 2103:

“The Secretary has general superintendence over the merchant marine of the United States and of merchant marine personnel insofar as the enforcement of this subtitle is concerned and insofar as those vessels and personnel are not subject, under other law, to the supervision of another official of the United States Government. In the interests of marine safety and seamen's welfare, the Secretary shall enforce this subtitle and shall carry out correctly and uniformly administer this subtitle. The Secretary may prescribe regulations to carry out the provisions of this subtitle.”

Central to this charge is the intricate relationship between mariner credentialing, seamen's welfare and protection, vessel manning, and watchkeeping. Although their origins are distinct, these components are necessarily linked forming a network critical to the interests of a safe, secure, and environmentally sound Marine Transportation System. Marine Safety Manual Volume III outlines the various domestic laws, regulations, and international requirements governing marine industry personnel and provides fundamental policy and procedures for the administration of these functions. Volume III is organized into three parts; Part A: Mariner Credentialing, Part B: Vessel Manning, and Part C: Shipment and Service. Related policy can also be found in MSM Volumes I, II, IV, and V.

Unless expressly provided otherwise, Parts B and C are intended to apply to Vessels of the United States. Reference MSM Volume II Section D for port state control guidance applicable to foreign vessels. Part B of this Volume may be referenced generally for those foreign vessels certificated by the U.S. Coast Guard, as well as for those without minimum safe manning documentation issued by their flag State to verify that the certification of the crew and minimum safe manning standard is compatible with the objectives of the STCW Convention and U.S. laws and regulations.

Area Commanders, District Commanders, Sector Commanders and unit Commanding Officers shall ensure that they and their personnel are familiar with the provisions of this Volume. The Volume must be used in concert with appropriate marine safety laws and regulations. In any case of apparent conflict between provisions of this manual and any statute or regulation, the legal requirements take precedence and the Office of Commercial Vessel Compliance, Commandant (CG-CVC) should be informed through the appropriate chain of command so that the matter can be resolved. In case of conflict between provisions of this Volume and conventional practice, the cognizant Officer in Charge, Marine Inspection (OCMI) should work through their chain of command to resolve the issue.

Program policy inquiries regarding Part A should be directed to the Office of Merchant Mariner Credentialing (CG-MMC). Program policy inquiries regarding Parts B and C may be generally directed to the Office of Commercial Vessel Compliance (CG-CVC).

NOTE: This change has reorganized the previous chapters under parts based on subject matter. The chapter numbers start over at “1” for each part. The chapter reference now includes both the part and chapter identification (e.x. The old Chapter 1 would now be A1). The new parts are:

Part ID	Part Title
A.	Mariner Credentialing
B.	Vessel Manning
C.	Shipment and Service

The date of each change since 1999 is shown in parentheses at the end of the subsection/paragraph titles within the text of each Part as well as at the end of each NOTE.

CH-1 (2014) by C. F. Heard IV.

CH-2 (2017) by C. F. Heard IV.

Figure 1-3:	Engineer License Grades And Endorsements	A1-22

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****A. Dealing With The Public.**

The Coast Guard's policy is to treat every member of the public with the utmost courtesy and professionalism. Every U.S. mariner has personal contact with one or more Regional Examination Centers (RECs) during his/her maritime career. Often, it is the person's only contact with the Coast Guard, and they form their impression of our service based solely on that contact. Courteous, professional service will make that impression a positive one.

1. Seafarers are professionals. Inaccurate information provided by the RECs can have a damaging impact on their employment and advancement opportunities. If unsure of the regulations or policy on a particular matter, personnel should adequately research the issue before responding. Responding quickly to questions is only of value if the information is accurate.
2. Recognizing that eighty-five percent of all maritime casualties are personnel related, the Coast Guard developed the concept of Prevention through People (PTP) to focus on the human element in reducing casualties and pollution. PTP stresses safe and profitable operations based on a balanced interaction between management, work environment, technology, and human behavior backed by a solid foundation of rules, regulations, and Standards. As part of the PTP implementation, the skills that mariners need and the best means of providing those skills must be addressed beyond traditional training methods.

B. International Standards.

Title 46 CFR Part 10 is designed to closely conform to the provisions of the International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW), 1978 as amended in 1995. The Convention was signed in June 1991 and went into effect for the United States in October 1991. The convention requires the issuance of certificates of competency to seafarers on board seagoing ships exclusive of public vessels, fishing vessels, pleasure yachts, and wooden ships of primitive build. See Chapter 9 for additional information on STCW.

C. Coast Guard Licensing Facilities.**1. Regional Examination Centers (RECs).**

- a. Licensing and certification functions are performed at 17 RECs located in the following cities:

Boston, MA	Miami, FL	Portland, OR
New York, NY	New Orleans, LA	Seattle, WA
Memphis, TN	Houston, TX	Honolulu, HI
St. Louis, MO	Toledo, OH	Juneau, AK
Baltimore, MD	Long Beach, CA	Anchorage, AK
Charleston, SC	San Francisco, CA	

- b. A basic objective of the REC concept is to make the licensing and certification transaction as simple and fast as possible while ensuring the quality, competence, and professionalism of U.S. merchant mariners. The 17 RECs directly impact the field licensing and certification functions contained in the following publications:

- (1) Code of Federal Regulations (CFR), Parts 10, 12, 13, 14, 15, and 16;
Navigation And Vessel Inspection Circulars (NVICs); and,

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

(2) Commandant Instructions (COMDTINSTs), including the Marine Safety Manual (MSM).

2. Monitoring Units (MUs).

These facilities provide a limited range of services as specified by the parent REC.

<u>Monitoring Unit</u>	<u>Parent REC</u>
Hampton Roads, VA	Baltimore, MD
San Juan, PR	Miami, FL
Guam	Honolulu, HI
Ketchikan, AK	Juneau, AK

3. Traveling Examination Teams (TETs).

Traveling examination teams administer examinations to groups of applicants away from the REC. Refer to chapter 6 of this volume for specific information concerning TETs.

D. Headquarters, District, and REC Responsibilities.

Figure 1-1 presents the primary marine industry personnel functions of the local RECs, District (m) offices, National Maritime Center, and the Commandant.

E. Appeals.

Whenever an REC denies an application, the reason for denial will be set forth in writing to the applicant. The applicant will also be given a copy of the appeal rights. The applicant may submit an appeal following the procedures specified by the regulations (46 CFR 1.03). An applicant's first recourse is to request reconsideration by the Officer in Charge, Marine Inspection (OCMI).

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****Figure 1-1: PRIMARY MARINE INDUSTRY PERSONNEL FUNCTIONS**

<u>FUNCTIONS</u>	<u>LOCAL</u>	<u>DISTRICT</u>	<u>NATIONAL MARITIME CENTER</u>	<u>HEADQUARTERS</u>
Regulatory action regarding merchant vessel personnel.	Review all proposals and implement existing and new regulations as directed.	Review all proposals and provide comment to HQ.	Review all proposals and provide comments to HQ.	Propose, receive, and evaluate comments and draft regulations; overall management of project to completion (G-MSO).
Records for merchant vessel personnel.	Maintain all individual applicant records for licenses.	None.	Maintain Merchant Mariner License and Documentation (MMLD) system. Maintain all seaman records 1937-present.	None.
Appeals regarding licensing and certification of merchant vessel personnel.	Advise applicant (individuals or institutions) of appeal rights and procedures. Forward appeals to District with recommendation.	Appeal authority for decisions made by the local REC and OCMI. Forward appeals of district decisions to NMC with recommendation.	Final appeal authority for decisions made by the District on any appeal. Forward appeals of NMC decisions to G-MO with recommendation.	Appeal authority for decisions initially made by the NMC. (G-MO)
Appeals regarding policies and decisions originated by the NMC. This does not include appeals originating at the OCMI or District levels.	None.	None.	Advise individual or institution of appeal rights and procedures. Forward appeals to G-MO with recommendation.	Final appeal authority for policies or decisions originating at the NMC.
Appeals regarding merchant vessel manning.	Advise individuals or institutions of appeal rights and procedures. Forward appeals to District with recommendation.	Appeal authority for decisions made by the local OCMI. Forward appeals of District decisions to HQ (G-MOC) with recommendation.	None.	Final appeal authority for decisions made by the District (G-MOC).

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****Figure 1-1: PRIMARY MARINE INDUSTRY PERSONNEL FUNCTIONS**

<u>FUNCTIONS</u>	<u>LOCAL</u>	<u>DISTRICT</u>	<u>NATIONAL MARITIME CENTER</u>	<u>HEADQUARTERS</u>
Training courses for merchant vessel personnel.	Evaluate facility and make recommendation. Approval authority for additional facilities.	None.	Establish policy regarding course approval process. Approving authority for training courses and defining approval credit (NMC).	Appeal authority for decisions made by the NMC (G-MO).
Correspondence regarding merchant personnel.	Correspond directly with members of the public. Refer appropriate correspondence to District.	Correspond directly with members of the public, industry, and joint working groups. Refer appropriate correspondence to NMC.	Corresponds with members of the public, Congress, maritime unions, and joint working groups.	Corresponds with members of the public, Congress, maritime unions, and joint working groups (G-MSO).
Liaison with international organizations, government agencies, shipping companies, unions, advisory committees, and state and federal schools regarding merchant vessel personnel.	Conduct liaison with individuals or organizations affected by the local REC operations. Contact with international organizations must be authorized by the NMC.	Conduct liaison with affected individuals or organizations within District. Contact with international organizations must be authorized by the NMC.	Liaison with international organizations government agencies, members of Congress, and state and Federal schools. Coordinate interaction with HQ.	Primary liaison with international organizations government agencies, members of Congress, and State and Federal schools (G-MSO).
Policy guidance for the merchant vessel personnel program.	Implement policy and provide feedback to district and the NMC.	Propose District policy, review promulgated NMC policy, and provide comments to NMC.	Research, propose, and promulgate policy for licensing, certification, and training.	Develops regulation and assists with the promulgation of policy for licensing, certification, and training (G-MSO).
REC operating procedures regarding merchant vessel personnel.	Conduct REC operations in accordance with District and NMC policy. Conduct all traveling exam teams (TET) functions.	Ensure uniformity of REC policy and operations within District.	Ensure uniformity of REC policy and operations nationwide.	None.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****Figure 1-1: PRIMARY MARINE INDUSTRY PERSONNEL FUNCTIONS**

<u>FUNCTIONS</u>	<u>LOCAL</u>	<u>DISTRICT</u>	<u>NATIONAL MARITIME CENTER</u>	<u>HEADQUARTERS</u>
Manning requirements for new and existing vessels.	Advise OCMI of manning levels of standard vessel types and make recommendations to HQ for unusual manning approvals.	Ensure uniform manning procedures conducted by units within District. Forward and endorse local recommendations to HQ.	Provide technical assistance to HQ, District, and OCMI.	Review and approve reduced manning for unique vessels and set national manning policies and standards (G-MOC).
Military and unusual service.	Evaluate in accordance with current guidelines.	None.	Establish policy and guidelines to ensure service is equivalent to merchant mariner service.	None.
Physial standards.	Evaluate applicants in accordance with current guidelines. Grant or deny hearing, eyesight, disability waivers. Forward to the NMC, waivers that require medical advice.	None.	Establish policy and guidelines. Obtain medical advice and grant or deny waivers for requests that require medical advice.	Provide professional medical review. Recommend approval/denial of physical waiver requests (CGPC-admin-1).

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****Figure 1-1: PRIMARY MARINE INDUSTRY PERSONNEL FUNCTIONS**

<u>FUNCTIONS</u>	<u>LOCAL</u>	<u>DISTRICT</u>	<u>NATIONAL MARITIME CENTER</u>	<u>HEADQUARTERS</u>
License and certificate examination for merchant vessel personnel.	Maintain and administer examinations. Make recommendations on examination content or changes. Provide feedback to NMC.	None.	Establish policy and guidelines for content and administration of examinations. Coordinate examination development and preparation.	None.
Shipment and discharge of merchant vessel personnel.	Review and retain submitted logbooks, Provide necessary forms and answer questions regarding the shipment and discharge of merchant vessel personnel.	None.	Establish guidelines for all affected individuals and groups.	None.
Outer Continental Shelf (OCS) exemptions and citizenship requirements for employment of personnel on units engaged in OCS activities.	None.	Coordinate enforcement of citizenship requirements within District.	None.	Receive exemption requests and approve or deny request after labor survey conducted in conjunction with Department of Labor. Make determinations on applicability of OCS citizenship requirements. Coordinate requests for Presidential decisions as provided by the OCS Lands Act (G-MOC).

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****F. Fraudulent Applications.**

An application not completed truthfully may be considered fraudulent (see 18 U.S.C. 1001). An initial license or Certificate of Registry (COR) that was issued based upon a fraudulent application may be considered "null and void ab initio," (from the beginning) as if the license was never issued; [see Commandant Decision on Appeal 2025]. When a fraudulent application is discovered, the applicant shall be notified that the license or COR issued based upon it, is considered invalid, if it is an initial issue license. Such a license or COR shall be returned to the Coast Guard. If it is discovered that a license or COR was reissued based on a fraudulent or incomplete application, that license or COR may be "revoked" using the suspension and revocation (S & R) procedures found in 46 CFR Part 5. In such cases, the mariner must be provided with an administrative hearing where the license or COR may be revoked for misconduct based on the fraudulent application. The S & R process should also be sought when it is discovered upon reissue of a license that the applicant's original license was initially issued by fraudulent means. Licensed mariners holding second and later issuance licenses have acquired "property interest" in the license. This "property interest" is protected by the due process requirements of the Fifth and Fourteenth Amendments of the Constitution. In such cases the Coast Guard Senior Investigating Officer (SIO) shall be notified by the Chief, Regional Exam Center.

1. Fraudulent License or COR Returned.

If a fraudulently obtained license or COR is voluntarily returned, not revoked in a suspension or revocation proceeding, it shall be canceled. The applicant may re-apply by submitting a proper application. The OCMI may issue a new license or COR if the applicant meets the minimum requirements including character and habits of life. If appropriate, the OCMI may assign an "assessment period", the length of which shall be within the parameters of 46 CFR Table 10.201(h) and 46 CFR Table 10.201(i).

2. Suspension and Revocation Proceedings.

Jurisdiction for suspension and revocation proceedings exists when the possession of a certain document, COR or license is a prerequisite for the application or when an applicant is renewing a license, COR, or MMD. In such cases, the matter should be discussed with the unit's Senior Investigating Officer to determine what, if any, action is appropriate under 46 CFR Part 5.

G. Determining Eligibility.

All applicants must, to the satisfaction of the OCMI, possess all the qualifications necessary for the license or COR.

1. License and Renewal Application.

Every mariner seeking an original license or certificate, raise in grade, renewal, increase in scope, or other endorsement shall complete an application form. The applicant must prepare the application form and conduct whatever research is necessary. An application shall not be accepted until it is complete.

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- a. Changes To An Application.

Any changes to an application should be made and initialed by the applicant. If this is not feasible due to mailing problems or if corrections are made by REC personnel, REC personnel should initial the changes. Items that do not apply should be marked "Not applicable" or "N/A."
 - b. Character Record.

As per 46 CFR 10.201(h), every applicant must mark the proper "yes" or "no" box for the convictions and usage of narcotics questions and initial the answer. Chapter 3 of this volume gives specific guidance for evaluating character.
 - c. Character References.

Character references are required for all original licenses and CORs. For many licenses, 46 CFR 10.205(f)(1) identifies from whom an applicant must have recommendations. Letters must have original signatures. However, they need not be notarized.
 - d. Signing Applications.

Evaluators should endeavor to verify the identity of the person signing an application by reasonable means. There is no requirement that a signature must be notarized.
 - e. Listing Sea Service.

Applicants must provide all the information requested when listing sea service on the appropriate section of the application. In the event that the gross tonnage is not available (as for public vessels), the displacement tonnage should be provided. The proper information is often obtainable from the Marine Safety Information System (MSIS), or other authoritative sources.
2. Processing Applications.

As stated in 46 CFR 10.202(a), an application will remain valid for one year from the date it is approved. An approved application shall contain all the paperwork and service required by law or regulation. Qualifying factors such as recency, physical examination, drug test, required training, etc. will be considered valid as long as the application is valid. Applicants should meet all eligibility requirements for a license before sitting for the examination. (OCMIs may make an exception and allow applicant's to examine for the license or document, if the applicant is in need of firefighting and/or radar training. Applicants that are never able to pass the examination would lose a considerable amount of money having already obtained this relatively expensive training.)

 - a. Seaman Locator and Wanted Lists.

Every license or COR transaction should include a check of the Locator and Wanted Lists. If the applicant is listed, the command that made the entry on the list must be notified immediately.

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- b. National Driver's Register (NDR) Check.
All applicants for any transaction involving a license must sign the NDR release section of the application (CG-719b).
- c. Drug Use and Convictions.
Title 46 U.S.C. 7503 gives the Coast Guard authority to deny a license, or a certificate of registry or MMD to an individual who has been convicted of violating a dangerous drug law of the United States or of a State. This section also allows the Coast Guard to deny a license, COR or MMD to an individual who has been a user of, or addicted to, dangerous drugs, who has not proven cure. Military non-judicial punishment is not considered to be a conviction. However, a special or general courts-martial is to be considered a conviction. A discharge from military service as the result of drug use should be considered as a history of drug use, but not as a drug conviction. See Chapter 3 of this volume for guidance on evaluating cases involving illegal drugs.
- d. Required Training.
- (1) Firefighting. Only training courses approved by the Coast Guard can be used to meet the requirement for firefighting training. Military or foreign firefighting training may not be substituted unless it is Coast Guard approved.
 - (2) Cardiopulmonary Resuscitation and First Aid. Acceptable training is listed in 46 CFR 10.205(h). Medical doctors, registered nurses, and licensed physician assistants (not all states have licensed physician assistants) need not take the courses if they have had training in emergency medicine. Emergency Medical Technicians need not take the courses.
 - (3) Radar Observer. Only training courses approved by the Coast Guard can be used to meet the requirement for radar observer training. Military or foreign radar observer training may not be substituted unless it has C.G. approval.
 - (4) STCW. Certain license applicants must comply with STCW requirements. See applicable NVICs and policy.
- e. Minimum Age.
46 CFR 10.201(f) contains the minimum age requirements for issuance of any license including radio or staff officers. The only license, for which the OCMI has the discretion to lower the age requirement, is operator of uninspected passenger vessels. See 46 CFR 10.202(h).

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**3. Creditable Service.a. Documenting Service.

Applicants must present documentation of their service when making application. The OCMI must be satisfied that the documentation is authentic and may make inquiries to verify any documentation considered suspect. If documentation is in the form of a letter from an employer, only original letters (not photocopies) on company letterhead should be accepted. Chapter 2 of this volume discusses documenting military service. Chapters 10 and 13 discuss self certification of service for masters, mates and operators of uninspected passenger vessel licenses respectively.

b. Age Considerations.

Neither the law, nor regulations specify a minimum age for accepting service as creditable. However, the regulations are clear that applicants must satisfy the OCMI that they possess all the qualifications necessary for a license. Certainly the age at which the majority of the service was obtained should be part of the OCMI's evaluation. Each application must be evaluated on its own merit.

c. Time and A Half Credit.

OCMIs should be cautious when giving time and a half credit for service submitted for evaluation. See chapter 2 of this manual for a discussion of when time and a half credit is appropriate.

d. Recency of Experience.

46 CFR 10.202(e) requires three months qualifying service on vessels of appropriate tonnage (deck licenses) or horsepower (engineer licenses) within the three years preceding the license application. There is no time limit in which the remaining qualifying service may have been completed.

(1) Tonnage/Horsepower of Recent Service. The regulations specify the tonnage or horsepower of qualifying experience for various licenses. Apply the same rules to the required recent service. For example, to qualify as Third Mate, any gross tons (GT), an applicant must have all of their experience on vessels over 200 GT with at least half of that time on vessels over 1600 GT. This also applies to the recency requirement where all of the recent experience must be on vessels over 200 GT with at least half of that time (45 days) on vessels over 1600 GT.

(2) Nature of Recent Service. Only actual underway time may be used to satisfy recency requirements. Underway service completed as part of an approved course is acceptable. Simulator training may not satisfy recency requirements. Such underway service is noted on the approved course list (also see 46 CFR 10.304(b) r (d)).

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- e. Special Limitations.

When an REC intends to issue a license with a limited route or other special limitations, the OCMI for the inspection zone that covers the intended area of operation shall be consulted. The local OCMI will generally have better on-scene experience and knowledge of the hazards and operating conditions involved. Likewise, the local OCMI will make the determination as to what is considered to be a formal camp, as referred to in 46 CFR 10.429, 10.456 and 10.466(g). Factors to be considered by the OCMI when issuing this designation include the number of personnel involved in the operation, the safety procedures followed during normal operations, the structure of the organization, the number of times the operation takes place and any other factors the OCMI feels are relevant to the determination.
- f. Removing Special Limitations.

An REC shall not remove special limitations, such as those discussed in the preceding paragraph, which were placed on a license by another REC without consulting that REC.
- g. Foreign Sea Service.

Experience or service acquired on foreign vessels is creditable, subject to evaluation by the OCMI. It must be a fair and reasonable equivalent to service acquired on merchant vessels of the United States with respect to grade, tonnage, horsepower, waters and operating conditions. An applicant who has obtained qualifying experience on foreign vessels shall submit satisfactory documentary evidence of such service (including any necessary translation into English) in a form that satisfies the OCMI as to the authenticity of the service. An original license or certificate of registry shall not be issued to any naturalized citizen on less experience in any grade of capacity than would have been required of a United States citizen by birth. Also, a U.S. license will not be issued in a grade higher than that upon which he or she has actually served while acting under the authority of a foreign license or in a higher grade than the foreign license the applicant holds.
4. Citizenship.

No certificate of registry of license other than Operator of Uninspected Passenger Vessels (OUPV) may be issued to anyone who is not a citizen of the United States. OUPV licenses issued to non-U.S. Citizens must be limited to uninspected vessels not documented under the laws of the United States. Refer to the non-citizen notation in section "P.8" of this chapter for the proper wording. 46 CFR 10.205(c) discusses proof of citizenship.
5. Chemical Testing for Dangerous Drugs.

All applications for licenses or CORs, except those found in 1.G.5.c of this volume, including requests for license upgrades or renewals must be accompanied by proof that the individual is free of dangerous drugs. The "Dangerous drugs" tested for under the DOT rules are: marijuana, cocaine, opiates, phencyclidine (PCP) and amphetamines. A positive test for some other drug may not be grounds for denial of a license under the drug test

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

regulations. (Applicants that may use or be addicted to other drugs should have their character and habits of life evaluated under the guidelines in chapter 3). Drug tests are valid for six months from the date the sample was taken.

a. Approved Drug Testing Laboratories.

All tests, except those done for active duty military personnel, must be done by laboratories certified by the Substance Abuse and Mental Health Services Administration (SAMHSA), an agency of the Department of Health and Human Services (DHHS). Tests done by Department of Defense (DOD) approved laboratories are only acceptable for active duty military personnel.

- (1) SAMHSA, DHHS Labs. SAMHSA, DHHS approved labs are listed in the Federal Register during the first week of each month. It is not uncommon for a lab to lose its SAMHSA, DHHS approval. RECs should keep the lists for six months and refer to the proper one to verify the lab was approved at the time the test was done. Verification of current SAMHSA, DHHS approval can also be made by calling their Drug Free Workplace Hotline, 1-800-843-4971.
- (2) DOD Labs. According to the Office of the DOD Coordinator for Drug Enforcement Policy and, only active duty status military personnel can be tested at DOD approved drug testing laboratories. For a current listing of DOD approved laboratories or any questions regarding these labs, contact NMC-4C.

b. Acceptable Proof of Drug Tests.

Acceptable evidence that an applicant has passed a required drug test is listed below. The evidence described in paragraphs (1) through (6) may be accepted by fax from the originator and RECs may verify the authenticity by calling the source. A fax copy hand carried by an applicant is not acceptable.

- (1) A completed drug test form (report or letter) signed by the medical review officer (MRO) or authorized representative of a consortium showing the applicant has passed a chemical test for dangerous drugs conducted in accordance with 49 CFR 40 within the previous six months.
- (2) A letter on company or consortium stationary signed by an authorized official that administers the drug testing program stating that the applicant passed a test for dangerous drugs within the previous six months with no subsequent positive drug tests during the remainder of the six month period.
- (3) A letter on company or consortium stationary, signed by an authorized official that administers the drug testing program, stating that the applicant has been subject to random drug testing for at least 60 days during the previous 185 days, has not failed any tests, and has not refused to participate in any required test.

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- (4) For military members, active duty or reserve, a letter from the applicant's command stating that the applicant has passed a required chemical test for dangerous drugs within the previous six months.
- (5) For active duty military members, a letter from the applicant's command stating that the applicant has been subject to random drug testing for the past six months and has not failed any tests. Being subject to random testing is not accepted for reserve military members.
- (6) By current law, civilian government mariners are not required to provide positive drug test results to another government agency. This includes the Coast Guard. For licensed civilian government mariners of the Military Sealift Command, U.S. Army Corps of Engineers, and National Oceanic and Atmospheric Administration, RECs may accept a letter from the applicant's command/headquarters/home office as proof that the mariner has been enrolled in a bona fide drug testing program and has been subject to random drug testing for at least 60 days during the previous 185 days. The letter shall also certify that the mariner has not failed or refused participation in a chemical test for dangerous drugs. See 46 CFR 16.210(b)(2).

c. License Transactions Which Do Not Require Drug Tests.

Currently, license transactions that do not require a drug test are those involving the following: inactive renewal, issuance of a duplicate license or COR or obtaining endorsements such as assistance towing, auxiliary sail, tonnage increase, horsepower increase, route increase or adding a lesser license to an existing license.

d. Positive Results From Drug Tests.

Positive results from a test for dangerous drugs for a holder of a license, COR or MMD should be immediately reported to the Senior Investigating Officer for investigation.

H. Issuance Of Licenses Or Certificates Of Registry (COR).

A person who meets all the requirements of the regulations is issued an appropriate license or COR valid for a term of five years. If the status of a foreign national changes while holding a license, the license is no longer valid. For other exceptions see 46 U.S.C. 7106 and 46 U.S.C. 7107.

1. Preparation Of Licenses and CORs.

Licenses and CORs shall be typed. There shall be no erasures or whiteouts. Female licensees shall be accommodated when requesting the printed "HE" be crossed out and "SHE" typed onto their license or COR while it is being prepared. Unused words or spaces and unused lines on the face of a license or COR shall be lined out to prevent improper additions. If the license description is too long to fit on the face of the form, the last line on the face shall end with "(continued on reverse)." Endorsements added to a current license, are put on the back of the license form. Unused space on the back of the license form shall

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

not be lined out, so that further endorsements can be added. Endorsements and license descriptions continued from the face shall end with the signature of the issuing officer. All issuing officer signatures shall be impressed with the Coast Guard seal. A license or COR recipient shall sign the back of the license or COR where indicated. There is no requirement to put a thumb print on a license or COR.

2. Citizenship.

U.S. Citizenship is required for all licenses and CORs except for an operator of an undocumented, uninspected passenger vessel (OUPV) as noted in 46 CFR 10.201(e). However, there are certain circumstances where a limited scope license may be issued to a non-U.S. citizen. Such cases should be referred to the NMC.

a. Verification Of Citizenship.

Acceptable evidence of citizenship is listed in 46 CFR 10.205(c). Evidence of citizenship must be an original document or a copy certified by the agency that issued the original. The OCMI may reject any evidence of citizenship that is not believed to be authentic. A provision for acceptance of a delayed certificate of birth is found in 46 CFR 10.205(c)(1)(vii). Some states issue delayed certificates of birth that do not indicate the evidence upon which they were granted. The Commandant considers such a certificate to be acceptable provided it is issued under a state seal.

b. Evidence Of Citizenship To Be Noted On Licenses and CORs.

When a license or COR is issued, the reverse shall note the evidence of citizenship presented within the operational parameters of MMLD.

3. Name Changes.

When the name that an applicant uses is different from what appears on the proof of citizenship, the applicant must show that the name has been legally changed. Certified copies of a court order or other official document, such as a marriage license, effecting a name change must be presented. Without this documentation, the name on the proof of citizenship must be used.

4. Social Security Numbers.

Each license or COR must show the applicant's social security number on the line for "2 or Book Number" if it is different from the MMD or Book Number or if the applicant does not hold an MMD or continuous discharge book. A social security card is not required; however, applicants for an original license must present satisfactory evidence of their social security number. Accurate numbers are essential since the license, COR and MMD records are all keyed to social security numbers.

5. Issue Numbers.

Issue numbers for all licenses are now a single number. The issue number shows how many licenses of that group have been issued to the mariner. Licensed groups are listed in section N. of this chapter. Previously, deck, engineer and OUTV licenses had two part

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

issue numbers. The first number indicated the number of licenses that had been issued to the holder in that grade. The second number indicated the total number of licenses in all grades of that group that had been issued to the mariner. For instance, if a second mate's license has an issue number of 3-5, it is the third second mate license and the fifth deck license. When that license is renewed or raised in grade, the issue number will be -6-. OCMI's may issue a license with a two part issue number if a mariner specifically requests it.

6. Oaths.

Whenever an original license or COR is issued, 46 U.S.C. 7105 requires the applicant to take the oath in section VII of the license application form. The penalty for willfully and knowingly making false statements is contained in 18 U.S.C. 1001.

a. Oaths For Renewals.

The oath is not required for license or COR renewals because the oath taken for the original license or COR is considered to remain in effect until it is renounced in writing to the OCMI by the license holder.

b. Authority To Administer Oaths.

Commissioned and warrant officers assigned to REC duty are authorized by the Commandant under 14 U.S.C. 636 to administer all oaths required by law in the licensing and certification of merchant mariners. In such cases, officers shall use their military rank, rather than signing "for the OCMI." Civilians and other designated representatives may also administer the oath with written authorization from the OCMI. When an applicant is not appearing in person, the oath must be administered and verified by a certified notary public and signed by the applicant. RECs shall ensure that oaths are signed and properly witnessed.

7. Fingerprints.

Applicants for an original Coast Guard license or COR will have their fingerprints taken and sent to Commanding Officer, National Maritime Center (NMC-4A), for an FBI criminal history evaluation. See chapter 8 for exceptions and instructions for preparing fingerprint cards.

8. License Signatures.

All licenses and CORs are to be signed by the OCMI. Additions made on the reverse of licenses must also be signed by the OCMI. The OCMI may designate officers, warrant officers, and civilians of their staffs to sign Coast Guard licenses, certificates of registry, and seaman's documents, "By direction." Authorization to sign by direction shall be by letter of designation from the OCMI.

9. Coast Guard Seal.

Each signature of the OCMI or OCMI designee on the face or reverse of a license or COR shall be impressed with the Coast Guard seal.

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

10. Disposition Of Exchanged Licenses and CORs.

When a new license or COR is issued to replace an unexpired license or COR, the old one will be stamped "canceled" on the back. Expired licenses do not need to be canceled. Canceled or expired licenses or CORs may be returned to the holder. If the holder does not want the old license or COR, it shall be placed in the mariner's file.
 11. Acknowledgments Upon Receiving Licenses and CORs.

To help eliminate misunderstandings, mariners should verbally acknowledge the following when they receive their license or COR.

 - a. The expiration date.
 - b. That it has no authority beyond the expiration date.
 - c. It is solely the mariner's responsibility to renew it.
 - d. There will be additional requirements for licenses that are expired for over one year and,
 - e. That if a radar observer is normally needed, but was not renewed, an acknowledgment that the holder may not serve under the license on radar equipped vessels of 300 GT or over, or radar equipped uninspected towing vessels of at least 26 feet length.
- I. License and COR Renewals.

Every applicant for renewal of a license or COR shall submit an application form. The completed form is retained in the applicant's file at the REC that issues the renewed license or COR. The applicant shall furnish all information required by the form. The sea service section and employment/training blocks shall be completed for all license renewal applications.

 1. Professional Requirements For Renewal.

Applicants must prove they possess all the requirements for renewal. Sea service shall be verified by certificates of discharge and where appropriate, letters of service. Employment closely related to the operation, construction or repair of vessels shall be verified by a letter from the employer. Applicants who can not or do not meet the professional requirements for renewal may renew for continuity purposes.
 2. File Verification.

Mariners may have their license or COR renewed at any REC. If only a copy of the license is submitted and the license file is located at another REC, a phone call or E-mail verification of the license is required. When licenses or CORs are renewed, applicants should be asked where they would like their files maintained.

PART A: MARINER CREDENTIALING
CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL

3. Notarized Applications Not Required.

Mariners that submit renewal applications by mail do not need to have their signatures notarized. Sighting the original license or COR or verifying the file should be sufficient to ensure the validity of the application.

4. Verification Of Pilot's Endorsements.

When RECs renew a license with pilotage routes for another REC's zone, they must contact the appropriate REC by phone or E-mail to ensure that the route descriptions are still correct.

5. Licenses With Waivers.

When a license with a waiver is renewed, the waived condition must be reevaluated by the level of authority (REC or NMC) that approved the waiver.

6. Denial Of Renewal Application.

No license or COR shall be renewed if title to it has been forfeited or if facts that render renewal improper come to the attention of the Coast Guard. Refer to chapter 3 for guidance on evaluating character and living habits and chapter 4 for guidance on evaluating physical conditions. Applicants may submit statements or evidence in their behalf with their applications. Whenever applications are denied, applicants must be advised of their appeal rights. (See section 1.E.)

J. Duplicate Licenses Or CORs.

A duplicate license or COR can be issued to replace a lost or mutilated license or COR. Mutilated licenses and CORs shall be canceled when a duplicate is issued.

1. Preparing Duplicate Licenses and CORs.

The issue number and date of the duplicate shall be the same as on the license or COR being replaced. That it is a duplicate shall be noted on the bottom of the license or COR face with the wording "This license (or certificate) replaces license (or certificate) number (NO.) issued at GREC NAME) on the above date."

2. Lost and Recovered Licenses and CORs.

The OCMI is required to report the loss, theft, or recovery of any license or COR to the Commandant. The letter of transmittal shall contain all the facts incidental to the recovery. A copy of this letter shall be forwarded to Commandant, (NMC-4C). [Note: This policy does not apply to licenses or CORs held pending completion of disciplinary action, as is the case of a license turned in by the master of a vessel for failure to join, or desertion.] Any license or COR that is turned over to the OCMI or otherwise recovered shall be forwarded to the issuing REC. If a license re-issue has already occurred, the recovered license shall be voided out.

PART A: MARINER CREDENTIALING
CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL

K. Reissuing Revoked Or Surrendered Licenses and CORs.

1. Form.

A license or COR restored after surrender or revocation shall be issued as a duplicate issue if within the five-year term of the revoked or surrendered license or COR; otherwise it will be issued as a renewed license or COR,

2. Requirements.

- a. If an individual is granted administrative clemency within five years of issuance of the revoked or surrendered license, there are no requirements other than submitting, an application.
- b. If administrative clemency is granted between five and six years after the license was issued (during the grace period), the application shall be treated in the same way as any renewal during the grace period.
- c. If administrative clemency is granted more than six years after the license was issued, the application will be treated in the same way as any renewal beyond the grace period.

L. Issuing Temporary Licenses.

Mariners that have had their license, COR or document revoked or suspended and are appealing that decision, may request temporary credentials. 46 CFR 5.707 governs issuance of temporary credentials. Upon presentation of an order for a temporary license or other credential from an administrative law judge or the Commandant, the OCMI will issue credentials in accordance with the order. A temporary credential will be valid for six months or upon service of the Commandant's decision on appeal, whichever occurs first. If it expires before the Commandant renders a decision on an appeal, it may be renewed if authorized by the Commandant. 46 CFR 5.715 governs issuance of credentials when appeals are made to the National Transportation Safety Board. Requests for temporary credentials are handled similarly except that the Commandant (G-MOA) will issue the order and the temporary credentials may be renewed for additional periods without special authorization. Temporary licenses and CORs will be numbered in the same way as duplicate licenses or CORs. Refer to section P.7. for the notation to be placed on temporary licenses and CORs. Refer to sections 2.H.6., and 2.H.7. of Volume V of this manual for additional information.

M. Raises Of Grade and Endorsements.

"Endorsement" and "raise of grade" are both defined in the regulations. Interpreting the definitions however, is not always an easy matter. The definition of "endorsement" contains an example of a license within the same general tonnage category but "tonnage category" is not defined. Based on the evaluation and testing required to obtain each deck license, there are in practice, four tonnage categories:

1. Upper level,
2. Lower level over 1600 tons,

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

3. Lower level not more than 1600 tons but over 200 tons, and
4. Lower level not more than 200 tons.

There are only two categories of engineer licenses; upper level and lower level. A license in one category is distinct from a license in another. For example, an unlimited ocean master's license is not merely a 100 ton master's license with a different route and a different tonnage limit. It is a completely different license with wholly different capabilities and responsibilities associated with it. The different experience, training, and knowledge requirements for the licenses reflect those differences. Refer to Figures 1-2 and 1-3 for assistance in determining if an applicant is obtaining an endorsement or a raise of grade. Apply that determination for the entire licensing process; determining professional requirements, applying user fees, and issuing a new license or endorsement.

1. Raises Of Grade.

Advancing to a higher level of authority (e.g., mate to master, assistant engineer to chief engineer) is always a raise of grade. Advancing to a higher category license (e.g., master 1600 to third mate-unlimited, master 200 to mate 500, or chief engineer (limited-oceans) to second assistant) is always a raise of grade.

2. Issuing Raises Of Grade.

The existing license will be withdrawn and canceled. A new license will be reflecting the raise of grade and new expiration date. This is true even if the raise of grade is not for the highest license on the form. (EXAMPLE: A mariner licensed as master 1600 GT and second mate, raises the grade of the second mate to chief mate. A new license, valid for five years, is issued as master 1600 GT and chief mate.) By obtaining a raise of grade, an applicant has essentially fulfilled all the requirements for a renewal and the entire license should therefore be issued for five more years.

3. Endorsements.

An "endorsement" is a provision added to a license or COR that alters its scope or application. Adding an endorsement of any type does not extend the life of the license or COR. Examples of endorsements are: a tonnage limitation increase within a general tonnage category, a route increase, or a radar observer qualification.

4. Issuing Endorsements.

Endorsements are added to the reverse of existing licenses. They do not extend the life of the license. To avoid confusion, especially with radar observer endorsements that expire independently of the license, each endorsement added to a license should end with the expiration date of the license, "(License expires //)." The words "See reverse" should be added to the front of the license.

5. Additional License Authority.

Some licenses do not fit neatly into the ranking of license seniority. An example would be a 200 ton master obtaining an OUTV license. The two licenses require different types and amounts of qualifying service, different examinations and each authorize the license

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

holder to serve on vessels that the other license would not. Figures 1-2 and 1-3 classify cases involving no clear seniority as "Additional License Authority." These are instances where the regulations, license qualification requirements, examination requirements, nor the license authority indicate a relative seniority of licenses. These licenses, while not actually a raise of grade, should be handled as such since the service and examination requirements justify issuing a new license valid for five years.

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL****N. License Groups.**

The following license groups have been established for the issuance of licenses.

1. Group A. Deck officer licenses
2. Group B. Engineer officer licenses
3. Group C. Radio officer licenses
4. Group D. Operator of uninspected passenger vessel licenses
5. Group E. Operator of uninspected towing vessel licenses

O. Combining Licenses.

Since there is a fee for each license form issued, mariners may, in some cases, have licenses from different groups put on the same license form. As an example:

1. An engineer holds first assistant steam and second assistant motor, these two licenses may be combined into one. Designated Duty Engineers (DDE) may be added to any engineer license.
2. A license in any lower grade may be added to a higher grade in the same group
3. A license as pilot may be added to any existing deck license or to a license as Operator, Uninspected Towing Vessels.
4. Operator, Uninspected Towing Vessels may be added to any master or mate license.
5. No license may be added to an Operator, Uninspected Passenger Vessel (OUPV) license. An OUPV license may only have an increase in scope to operate in another geographic area or assistance towing added to it. If the holder of an OUPV license qualifies for any other license, a separate license reflecting the other qualifications is issued. The OUPV license may be canceled and the OUPV authority added to a deck license.
6. Radio officers who qualify for any other license are issued a separate license to show the additional qualifications. Other qualifications are never added to a radio officer license.

P. Notations and Limitations.

The following notations or limitations will be placed on licenses when appropriate. Except for the COLREGS, color blindness, non-citizen, temporary license and Boy Scout/Sea Explorer notations, they shall be on the reverse side. When there are limitations or notations on the reverse of a license, "See reverse" shall be put on the face of the license form following the license description.

1. Corrective Lenses.

Applicants who must wear corrective lenses under 46 CFR 10.202(f) shall have the following notation on their license: "Corrective lenses to be worn with spare glasses carried on board."

2. Vision Waiver.

Applicants granted a vision waiver under 46 CFR 10.205(d)(4) shall have the following notation on their license: "Vision Waiver - Corrective lenses to be worn with spare glasses carried on board."

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**3. Physical Waiver.

Applicants granted a physical waiver under 46 CFR 10.205(d)(4) shall have the following notation on their license: "Physical Waiver -- Report any change in the waived condition to the issuing office within 30 days." If the Commandant's letter granting the waiver includes any special conditions or requirements, they shall be noted as well.

4. Hearing Waiver.

Applicants granted a hearing waiver under 46 CFR 10.205(d)(4) shall have the following notation on their license: "Hearing Waiver." If the waiver requires that a hearing aid be worn the notation shall be: "Hearing Waiver -- Hearing aid(s) to be worn with spare batteries carried on board."

5. Color Blindness.

Certain applicants such as Masters, mates, pilots or operators of vessels up to 100 GT or OUTV on river routes, who do not meet the color sense requirements may be issued a restricted license. These licenses shall have the following notation on the front of the license: "Limited to daylight hours only."

6. Continuity Renewal Notations.

Licenses renewed for continuity purposes under 46 CFR 10.209, shall have the following notation: "License renewed for continuity purposes only; service under the authority of this license is prohibited." If all the requirements to renew the license are later met, the following notation shall be added: "All renewal requirements met; service under the authority of the license is permitted."

7. Temporary License Or COR Notation.

Temporary licenses issued to mariners appealing their suspension or revocation shall have any text describing a five year term of validity lined out. Beneath the line showing the date the license or COR was issued, add the notation, "Temporary license (or certificate) issued under 46 CFR 5.707 (or 5.715) to expire in accordance with present regulations or upon service of the Commandant's (or NTSB's) decision on appeal, whichever occurs first. Replaces license (or certificate) # issued at on _."

8. Non-Citizen Notation.

Operator of uninspected passenger vessel licenses issued to non-U.S. citizens as allowed by 46 CFR 10.201(e) shall have the following restriction added to the vessel description on the face of the license: "...limited to uninspected vessels not documented under the laws of the United States."

9. COLREG Notation.

There are some inland waters where the 72 COLREGS apply. Therefore licenses issued to masters, mates, pilots and operators with rivers or inland waters routes that have not been tested on both Inland Rules and COLREGS shall have the following notation added to the route: "...excepting waters subject to the International Regulations for Preventing Collisions at Sea, 1972." The notation need not be added if the route already precludes

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

operation on COLREGS waters. [EXAMPLES: pilot licenses with routes that do not include COLREGS waters; operator licenses limited to a summer camp or marina.]

10. OUTV Oral Examination Notation.

If an OUTV was administered by an oral examination due to an inability to read as discussed in section 13.B.4, the license shall have the following notation: "Transportation of barges carrying dangerous cargo regulated under 46 CFR Subchapter 0 is prohibited."

11. Licenses Limited To Boy Scout/Sea Explorer Vessels.

The Inspection and Certification Agreement dated October 1, 1979 between the Coast Guard and the Boy Scouts of America has been canceled. Reference should be made to Navigation and Vessel Inspection Circular (NVIC) 7-94 "Guidance on the Passenger Vessel Safety Act of 1993", regarding the definition of "Passenger" and "Passenger for Hire". If a vessel owned and operated by the Boy Scouts or Sea Explorers is carrying only scouts, the scouts are considered "passengers" and not "passengers for hire". Such a vessel is not required to be Coast Guard inspected nor is the operator of the vessel required to be licensed by the Coast Guard. However, if the Boy Scouts of America or Sea Explorers charter a vessel (demise or non-demise charter) for their use, the inspection/licensing requirements may change accordingly; (See NVIC 7-94).

Q. Wording Of Licenses.

1. Master Licenses.

Upper level masters without tonnage limitations will have their licenses issued on form CG-5205, License for Master, unless they specifically request form CG-2849, License for Merchant Marine Officer, be used. Prepare form CG-5205, License for Master, in the following manner.

- a. On the blank line list any other authorities held;
- b. List the radar observer endorsement;
- c. Some examples of license descriptions are:

(1) "MASTER OF STEAM OR MOTOR VESSELS OF ANY GROSS TONS UPON OCEANS; RADAR OBSERVER (UNLIMITED) EXPIRES APRIL 2003."

(2) "MASTER OF STEAM OR MOTOR VESSELS OF ANY GROSS TONS UPON OCEANS; BALLAST CONTROL OFFICER; RADAR OBSERVER (UNLIMITED) EXPIRES AUGUST 2003."

2. Deck Officer Licenses.

For deck officers, prepare form CG-2849, License For Merchant Marine Officer, in the following manner.

- a. List the grade, for example, "MASTER," "THIRD MATE," "MATE," "OFFSHORE INSTALLATION MANAGER"; then,
- b. State the propulsion mode or other appropriate vessel description, for example, "STEAM OR MOTOR," "STEAM, MOTOR OR SAIL," "BOTTOM BEARING UNITS ON LOCATION"; then,

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- c. State the tonnage limitation, for example, "OF ANY GROSS TONS" or "OF NOT MORE THAN 4000 GROSS TONS"; then,
 - d. State the type of waters, for example, "OCEAN" or "NEAR COASTAL", "GREAT LAKES AND INLAND"; then
 - e. List any additional license authorities. Any license as master takes precedence over any other grade and therefore will always be listed first on the face of the license; then
 - f. List the radar observer endorsement.
 - g. Some examples of license descriptions are:
 - (1) "CHIEF MATE OF STEAM OR MOTOR VESSELS OF ANY GROSS TONS UPON NEAR COASTAL WATERS; RADAR OBSERVER (UNLIMITED) EXPIRES OCTOBER 2003. ";
 - (2) "MATE OF STEAM OR MOTOR VESSELS OF NOT MORE THAN 1600 GROSS TONS UPON NEAR COASTAL WATERS; RADAR OBSERVER (UNLIMITED) EXPIRES DECEMBER 2003. ";
 - (3) "MASTER OF STEAM OR MOTOR VESSELS OF NOT MORE THAN 100 GROSS TONS UPON NEAR COASTAL WATERS. "FOR DOMESTIC VOYAGES ONLY, THE HOLDER OF THIS LICENSE MEETS THE STCW 1995 REGULATIONS WITHOUT FURTHER ENDORSEMENT.";
 - (4) "MASTER OF STEAM OR MOTOR VESSELS OF ANY GROSS TONS UPON GREAT LAKES AND INLAND WATERS; RADAR OBSERVER (UNLIMITED) EXPIRES MARCH 2003.";
 - (5) "MASTER OF STEAM OR MOTOR VESSELS OF NOT MORE THAN 500 GROSS TONS UPON NEAR COASTAL WATERS; THIRD MATE OF STEAM OR MOTOR VESSELS OF ANY GROSS TONS UPON OCEANS; RADAR OBSERVER (UNLIMITED) EXPIRES SEPTEMBER 2003."
3. First Class Pilot Licenses.
 Each license description or endorsement specifically authorizes an individual to serve as first class pilot upon a specific body of water (or waters as the case may be) aboard a particular type of vessel (with appropriate tonnage limitations if applicable). Consequently, each license description or endorsement must be complete in itself and written in a manner that is both concise and accurate. For first class pilots, prepare form CG-2849, License For Merchant Marine Officer, in the following manner.
- a. State the grade, which will always be "FIRST CLASS PILOT," then
 - b. The license shall state "OF VESSELS," in lieu of "STEAM OR MOTOR" however, "OF TUG AND BARGE COMBINATIONS" may sometimes be appropriate, then
 - c. State the tonnage limit for the route, then
 - d. Describe the route. If the type of vessel and tonnage limit is the same for all routes, list all the routes one after another. If the vessel type or tonnage limit is not the same for all routes, that information must precede the appropriate routes.

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- e. List the radar observer endorsement.
 - f. Some examples of license descriptions are:
 - (1) "FIRST CLASS PILOT OF VESSELS OF ANY GROSS TONS UPON NEW YORK HARBOR, UPPER AND LOWER BAY; RADAR OBSERVER (UNLIMITED) EXPIRES MAY 2003."
 - (2) "FIRST CLASS PILOT OF VESSELS OF ANY GROSS TONS UPON NEW YORK HARBOR, UPPER AND LOWER BAY; ALSO, OF NOT MORE THAN 3000 GROSS TONS HUDSON RIVER TO YONKERS, NY; ALSO, NOT MORE THAN 2000 GROSS TONS EAST RIVER TO WELFARE ISLAND; RADAR OBSERVER (UNLIMITED) EXPIRES FEBRUARY 2003."
 - (3) "THIRD MATE OF STEAM OR MOTOR VESSELS OF ANY GROSS TONS UPON OCEANS; FIRST CLASS PILOT OF VESSELS OF ANY GROSS TONS UPON NEW YORK HARBOR, UPPER AND LOWER BAY; ALSO, OF NOT MORE THAN 3000 GROSS TONS HUDSON RIVER TO YONKERS, NY; ALSO, OF NOT MORE THAN 3000 GROSS TONS EAST RIVER TO WELFARE ISLAND; RADAR OBSERVER (UNLIMITED) EXPIRES NOVEMBER 2003."
4. Chief Engineer Licenses.
Upper level chief engineers without horsepower (power rating) limitations will have their licenses issued on form CG-5206, License for Chief Engineer, unless they specifically request that form CG 2849, License for Merchant Marine Officer, be used. Prepare form CG-5206, License for Chief Engineer, in the following manner.
- a. In the blank following "Chief Engineer of United States," state the propulsion mode, either, "STEAM," "MOTOR" or "STEAM and MOTOR"; then
 - b. List any other engineer licenses held.
 - c. Some examples of license descriptions are:
 - (1) "CHIEF ENGINEER OF STEAM AND MOTOR VESSELS OF ANY HORSEPOWER";
 - (2) "CHIEF ENGINEER OF STEAM AND MOTOR VESSELS OF ANY HORSEPOWER; ASSISTANT ENGINEER OF SELF-PROPELLED MOBILE OFFSHORE DRILLING UNITS";
 - (3) "CHIEF ENGINEER OF STEAM VESSELS OF ANY HORSEPOWER; THIRD ASSISTANT ENGINEER OF MOTOR VESSELS OF ANY HORSEPOWER."
5. Engineer Officer Licenses.
For engineer officers, prepare form CG-2849, License For Merchant Marine Officer, in the following manner:
- a. List the grade, for example, "CHIEF ENGINEER," "CHIEF ENGINEER (LIMITED-NEAR COASTAL)," "FIRST ASSISTANT ENGINEER," "DESIGNATED DUTY ENGINEER," or "ASSISTANT ENGINEER (LIMITED-OCEANS)"; then

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- b. State the propulsion mode, either, "STEAM," "MOTOR" or "STEAM and MOTOR" for conventional vessels or "SELF PROPELLED" or "NON-SELF PROPELLED" for MODUs; then
 - c. State the tonnage limitation, for example, "OF ANY GROSS TONS" or "OF NOT MORE THAN 4000 GROSS TONS"; then, State any restrictions as to type of vessel, "MOBILE OFFSHORE DRILLING UNITS" or "UNINSPECTED FISHING INDUSTRY VESSELS"; then
 - d. State the horsepower (power rating) limitation, for example, "OF ANY HORSEPOWER" or "OF NOT MORE THAN 4000 HORSEPOWER."
 - e. Where service in more than one grade is authorized, the senior grade should be first, regardless of any limitation, e.g., chief engineer (even if chief engineer (limited)), then first assistant engineer, etc. Designated duty engineer (DDE) should be listed after assistant engineer.
 - f. Some examples of license descriptions are:
 - (1) "FIRST ASSISTANT ENGINEER OF STEAM VESSELS OF ANY HORSEPOWER"
 - (2) "SECOND ASSISTANT ENGINEER OF STEAM VESSELS OF ANY HORSEPOWER AND MOTOR VESSELS OF NOT MORE THAN 4000 HORSEPOWER";
 - (3) "CHIEF ENGINEER (LIMITED -- NEAR COASTAL) OF STEAM AND MOTOR VESSELS OF NOT MORE THAN 5000 HORSEPOWER; THIRD ASSISTANT ENGINEER OF STEAM AND MOTOR VESSELS OF ANY HORSEPOWER";
 - (4) "ASSISTANT ENGINEER (LIMITED-OCEAN) OF MOTOR VESSELS OF ANY HORSEPOWER; DESIGNATED DUTY ENGINEER OF STEAM AND MOTOR VESSELS OF ANY HORSEPOWER."
 - (5) "DESIGNATED DUTY ENGINEER OF MOTOR VESSELS OF NOT MORE THAN 1000 HORSEPOWER"; and,
 - (6) "CHIEF ENGINEER OF UNINSPECTED FISHING INDUSTRY VESSELS OF NOT MORE THAN 4000 HORSEPOWER."
6. Radio Officer Licenses.
When preparing form CG-2987, License For Radio Officer, if the applicant is a female and so requests, draw a line through the word "HE" and type above it the word "SHE."
7. Operator Of Uninspected Passenger Vessel Licenses.
Prepare form CG-2849, License For Merchant Marine Officer, as in the following examples:
- a. "OPERATOR OF UNINSPECTED PASSENGER VESSELS AS DEFINED IN 46 U.S.C. 2101 (42) UPON NEAR COASTAL WATERS NOT MORE THAN 100 MILES OFFSHORE. "FOR DOMESTIC VOYAGES ONLY, THE HOLDER OF THIS LICENSE MEETS THE STCW 1995 REGULATIONS WITHOUT FURTHER ENDORSEMENT. ";

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- b. "OPERATOR OF UNINSPECTED PASSENGER VESSELS AS DEFINED IN 46 U.S.C. 2101 (42) UPON INLAND WATERS EXCEPT WATERS SUBJECT TO THE INTERNATIONAL REGULATIONS FOR PREVENTING COLLISIONS AT SEA, 1972"; and,
 - c. "OPERATOR OF UNINSPECTED PASSENGER VESSELS AS DEFINED IN 46 U.S.C. 2101 (42) UPON INLAND WATERS LIMITED TO UNINSPECTED VESSELS NOT DOCUMENTED UNDER THE LAWS OF THE UNITED STATES."
8. Operator Of Uninspected Towing Vessel Licenses.
Prepare Form CG-2849, License For Merchant Marine Officer, as in the following examples:
- a. "OPERATOR OF UNINSPECTED TOWING VESSELS UPON OCEANS (DOMESTIC TRADE) - LIMITED TO SERVICE ON VESSELS OF NOT MORE THAN 200 GROSS TONS WHEN ON OCEAN OR NEAR COASTAL ROUTES; RADAR OBSERVER (UNLIMITED) EXPIRES JULY 2003." "FOR DOMESTIC VOYAGES ONLY, THE HOLDER OF THIS LICENSE MEETS THE STCW 1995 REGULATIONS WITHOUT FURTHER ENDORSEMENT. ";
 - b. "OPERATOR OF UNINSPECTED TOWING VESSELS UPON GREAT LAKES AND INLAND WATERS; RADAR OBSERVER (UNLIMITED) EXPIRES JUNE 2003." "FOR DOMESTIC VOYAGES ONLY, THE HOLDER OF THIS LICENSE MEETS THE STCW 1995 REGULATIONS WITHOUT FURTHER ENDORSEMENT. ";
 - c. "SECOND-CLASS OPERATOR OF UNINSPECTED TOWING VESSELS UPON NEAR COASTAL WATERS - LIMITED TO SERVICE ON VESSELS OF NOT MORE THAN 200 GROSS TONS WHEN ON NEAR COASTAL ROUTES; RADAR OBSERVER (UNLIMITED) EXPIRES JANUARY 2003.""FOR DOMESTIC VOYAGES ONLY, THE HOLDER OF THIS LICENSE MEETS THE STCW 1995 REGULATIONS WITHOUT FURTHER ENDORSEMENT"; and
 - d. "OPERATOR OF UNINSPECTED TOWING VESSELS UPON WESTERN RIVERS; RADAR OBSERVER (RIVERS) EXPIRES AUGUST 2003."
9. Certificates Of Registry.
Prepare form CG-887, Certificate of Registry, in the following manner.
- a. If the applicant is a female and so requests, draw a line through the word "HE" and type above it the word "SHE," and
 - b. In the blank following the words "IN THE GRADE OF" state the grade of staff officer, for example, "CHIEF PURSER," "JUNIOR ASSISTANT PURSER," "PROFESSIONAL NURSE," then
 - c. If the applicant also holds an endorsement as "MARINE PHYSICIAN ASSISTANT" or "HOSPITAL CORPSMAN" that endorsement will follow the staff officer grade.
 - d. Above the text showing the issue date, type, "This certificate is valid for five years from this date and will expire on the day of, 200

PART A: MARINER CREDENTIALING**CHAPTER 1: LICENSES AND CERTIFICATES OF REGISTRY - GENERAL**

- e. Some examples of certificate of registry descriptions are:
- (1) "MEDICAL DOCTOR";
 - (2) "CHIEF PURSER/MARINE PHYSICIAN ASSISTANT";
 - (3) "SENIOR ASSISTANT PURSER/HOSPITAL CORPSMAN."

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****A. Military Service.**

Sea service requirements for original licenses and raises of grade are stated in 46 CFR Part 10, and are based on service aboard U.S. merchant vessels. 46 CFR Part 12 gives the requirements for unlicensed ratings. Military sea service experience must be a reasonable equivalent to the service required of a merchant mariner who is seeking an identical license or MMD. Military personnel applying for a license or MMD represent a challenge to the REC evaluating their application. This is due to the wide range of ratings and duties they present as sea service. The evaluations are normally conducted by the REC. The REC may refer the more difficult or sensitive evaluations to NMC. In addition, to avoid the appearance of favoritism or undue influence, the REC should refer an evaluation to NMC for any applicant that is:

1. A Coast Guard officer senior to the OCMI;
2. A Coast Guard officer stationed at the MSO or Activity senior to the chief of the REC; or
3. A person assigned to work at the REC.

B. Criteria For Accepting Military Sea Experience.**1. Application Evaluation.**

Evaluations of military experience are conducted when a Transcript Of Sea Service or equivalent information is presented with an application (see Section B.2). At the discretion of the REC, additional information may be requested. Generally, additional information will be required to verify claims of a higher percentage of underway time than the 60% normally allowed by the regulations. In addition, the REC may require an official description of duties statement, letters of qualification, service record entries, or letters from former supervisors or commanding officers.

2. Transcript Of Sea Service.

The Transcript Of Sea Service provides the periods of assignment, name of vessel, and capacity (rate/rank) served. The application must contain a Transcript Of Sea Service, not a shipboard generated letter or DD-214. Standard Form SF-180, Request Pertaining To Military Records, may be used by the applicant to obtain a transcript. This form lists the addresses of all the services where the request should be sent. The Federal Record Center, at St. Louis, MO, is not sending the ex-service person Transcripts of Sea Service. Instead, they are sending various pages from their personnel files which document when, where, rate, and duration of the applicant's sea service. Evaluators will have to become familiar with the various forms and how to extract the pertinent information. Because these forms are military in nature, MSO administration offices or PERSRUs could be of assistance in deciphering the information. The SIP may accept other documentation attesting to sea service if it has the same level of authenticity as a transcript. In other words, will it stand up to an audit?

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS**3. Tonnage.

The majority of military vessels are not measured in gross or net tonnage. Therefore, it is necessary for the evaluating officer to estimate the gross tonnage of the vessels for which experience is claimed. The formula "DISPLACEMENT x .57" provides an acceptable estimate of gross tonnage (use full load displacement). Jane's Fighting Ships is an excellent reference for finding the vital statistics of U.S. military vessels. It is likely that this source will provide the displacement for most military vessels. All Coast Guard high endurance cutters (WHECs), medium endurance cutters (WMECs) of the Bear class only (270 foot cutter), icebreakers (WAGBs), and the USCGC Eagle are over 1600 gross tons. All other Coast Guard vessels currently in service are less than 1600 gross tons. Former Coast Guard vessels of 255 feet (77 meters) and up were over 1600 gross tons.

4. Calculation of Service.

Military sea service shall be evaluated sequentially in the order obtained over the course of a military career, which reflects the same progression for a merchant mariner. Tonnage and horsepower limitations, if any, shall be calculated for each license level through the progression. It is not acceptable to average tonnage or horsepower over a career. Pay particular attention to the recency requirements in 46 CFR 10.202(e) because recency, or lack thereof, can also limit the tonnage or horsepower for an original license.

5. Description Of Duties Evaluation.

The most troublesome aspect of the military evaluation is translating military duties to meet the experience requirements specified in 46 CFR Part 10. Based upon past evaluations, the following guidelines have been developed. See Figure 2-2 and 2-3 of this chapter for further explanations and examples.

a. Officers.

Deck watch officers' (DWOs) and engineering watch officers' (EWOs) duties are considered equivalent to the watchstanding duties performed by licensed mates and engineers respectively aboard merchant vessels. Therefore, this qualifying sea service may be used to satisfy the experience requirements for an original or raise of grade of a mate or assistant engineer license. For an original third's license, up to eighteen months service as DWO/EWO may be substituted for up to 36 months of unlicensed service. One day of service as a DWO or EWO is counted as 2 days of unlicensed sea service to meet the requirements of the regulations. When computing sea service toward a license grade above third, such as an original second, or a raise of grade, DWO/EWO time is creditable on a one-for-one basis. Service experience obtained as a junior officer of the deck (JOOD) is considered equivalent (on a one-for-one basis) to able seaman time. See examples at the end of this chapter.

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS**

- b. Service As Commanding Officer (CO).
To qualify as unlimited master, at least six months of the required creditable service must have been as CO. The CO service must have occurred after the applicant had accumulated enough creditable service to qualify as chief mate. An applicant with military experience has not had exposure to merchant marine concerns such as cargo handling, payrolls, union relations, etc. Service as CO indicates that the applicant has experience in a position of responsibility which compensates, to some extent, for differences between the operation of military and merchant vessels.
- c. Service As Engineer Officer (EO).
To qualify as unlimited chief engineer, at least six months of the required creditable service must have been as EO. The EO service must have occurred after the applicant had accumulated enough creditable service to qualify as first assistant engineer. An applicant with military experience has not had exposure to merchant marine concerns such as payrolls, union relations, etc. Service as EO indicates that the applicant has experience in a position of responsibility which compensates, to some extent, for differences between the operation of military and merchant vessels.
- d. Enlisted Personnel Applying For Licenses.
Evaluation of sea service is more complex for enlisted personnel than it is for officers. This is due to the great variety of specialized duties that enlisted personnel perform. When evaluating underway sea service, use the following guidelines:
- (1) Service as a seaman apprentice (SA) or seaman (SN) is equivalent to sea service as an ordinary seaman or deckhand;
 - (2) Service as fireman apprentice (FA) or fireman (FN) is equivalent to sea service as a wiper or coal passer;
 - (3) Service as a petty officer in the deck department is considered equivalent to that of an AB; and
 - (4) Service as a petty officer in the engineering department is considered equivalent to that of a QMED.
 - (5) Deck rating of E-4 and above with qualifications as DWO is equivalent to licensed mate time.
 - (6) Service experience obtained as a junior officer of the deck (JOOD) is considered equivalent (on a one-for-one basis) to able seaman time.
 - (7) Engine rating of E-4 and above with qualifications as EWO is equivalent to licensed assistant engineer time.

Note: The above are only guidelines. Applicants furnishing time as a petty officer in charge of a navigational watch should have that time counted towards a licensed officer.

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS**

- e. Ratings Accepted Toward Licenses.
Certain ratings due to their nature are usually disqualifying on their face for a license. Figure 2-1 is a guide for evaluating service in various ratings. Suggested acceptance of service is indicated by "XXX." When evaluating military ratings, if the military service is found to be closely related to the duties of AB or QMED, then RECs are authorized to grant up to 50% of the service towards the applicable license

1ST RULE: CALCULATE 60% OF QUALIFYING TIME THEN APPLY ADDITIONAL % AS SHOWN ABOVE

¹ QMED 100% Only For Standing Engine room Watches; Watchstanding Must Be Documented.

² PURSER 100%; Must Be A PO1 Through MCPO, Or, PO2 For 5 Years In Supervising On Ordering.

³ QMED 100% Only For Standing Engine room Watches; Watchstanding Must Be Documented.

⁴ PURSER 100%; Must Be A PO1 Through MCPO, Or, PO2 For 5 Years In Supervising And Ordering.

⁵ HS and HM Rates, 1st Class Or Higher, Qualify For Hospital Corpsman Endorsement With At Least 1 Month Service In Military Hospital Or U.S. Public Health Services Hospital (Time At Sea Not Required); Must Be Issued Jr. Asst. Purser For This Endorsement.

⁶ QMED 100% Only For Standing Engine room Watches; Watchstanding Must Be Documented.

⁷ PURSER 100%; Must Be A PO1 Through MCPO, Or, PO2 For 5 Years In Supervising And Ordering.

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS**

- f. Ratings Accepted Toward MMDs.
- (1) Deck Service. Enlisted service, regardless of rating, must meet the definition in 46 U.S.C. 7301 of "service on deck" in order for it to be accepted toward any of the able seaman classifications.
 - (2) Engineer Service. Any enlisted service which can be equated to wiper or to any of the qualified member of the engine department (QMED) ratings may be accepted toward meeting the service requirements for all the QMED endorsements except deck engine mechanic and engineman. Qualifications for deck engine mechanic and engineman must be evaluated separately since these two ratings have specific qualification requirements which must be met.
- g. Submarine Service.
- (1) Enlisted Service. Care should be taken when applying Figure 2-1 to submarine service. Often on submarines non-traditional ratings such as YNs or SKs stand operational watches. Watchstanding qualifications and interviewing the applicant should help the evaluator determine what is acceptable submarine service.
 - (2) Deck Service. Only 75 percent of the total creditable sea service required for a deck license may be obtained aboard submarines. The remaining creditable sea service must have been obtained aboard surface vessels.
 - (3) Example. An applicant for an unlimited third mate license has a total of 20 months of creditable sea service on board submarines as DWO. The applicant is required to present 18 months of creditable sea service as DWO. Only 75% may be on submarines, therefore, only 13.5 months (18 months x .75) can be used toward the third's license. The additional 4.5 months must be obtained as a DWO on surface vessels.
 - (4) Engineering Service. In contrast, underway engineering service aboard submarines is considered equivalent to engineering service obtained aboard surface vessels.
 - (5) See 46 CFR 10.213(d) for further information.
- h. Service On Vessels Other Than Underway.
46 CFR 10.213(c) discusses the application of a 25% credit factor for periods of assignment to vessels at times other than underway. Creditable sea service for this category applies to vessels, whose sea service has not been previously used, that spend the vast majority of their time moored. An example, would be a submarine tender or a vessel undergoing an extended shipyard visit. The vessel status would not

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS**

be reflected on the Record of Sea Service but might be established during the evaluator's interview of the applicant.

- i. Credit For Military Schools. Unless the school is NMC approved, training received at a military school will not be granted sea service credit nor be accepted as meeting mandatory training requirements (e.g. radar observer, firefighting).
- C. Experience Aboard Dredges.
Self propelled dredges may conduct their operations upon inland waters. Service on board dredges should be evaluated to ensure appropriate ocean or near coastal service. Daily operations that include at least one voyage beyond the boundary lines for the disposal or mining of dredge material shall be credited as ocean service.
- D. Evaluating Coast Guard Personnel For Licenses.
Coast Guard personnel who apply for a license shall comply with all the regulations for the license. Officers senior to the OCMI, shall request permission from the district commander to apply for a license. In granting such requests, the district commander may require the applicant to comply with certain additional conditions. Some of these conditions may include submitting applications and taking examinations at a Regional Examination Center (REC) in another district.
- E. Examining Coast Guard Marine Safety Personnel For Licenses.
Coast Guard marine safety experience does not equate to shipboard service and may not be used to qualify for an original or raise of grade of a license. Such experience is generally helpful in preparing for a license examination; however, the only military service creditable towards eligibility for a license is underway service (except as discussed in paragraph 2.B.4.h. above). To prevent criticism or charges of Coast Guard favoritism in the licensing process, Coast Guard marine safety personnel must obtain permission to apply for a license from their district commander. The district commander may apply the restrictions listed above. However, under the present examination system, a separate randomly produced examination can allow the applicant to sit at the local REC. The applicant's file shall contain the letter of request and the district commander's letter of approval. Headquarters personnel should apply to the district commander in whose jurisdiction the REC resides. Refer to paragraph A.2. of this chapter for instances when applications must be sent to Commandant to be evaluated. Coast Guard personnel who have passed a rules of the road test as an end of course test or as a Deck Watch Officer examination will not be exempted from taking the rules of the road portion of any Coast Guard license examination.
- F. Examining Coast Guard Regional Examination Center Personnel For Licenses.
Special examinations should be requested from the examinations branch at the National Maritime Center for REC personnel. See chapter 5 for further details.

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****G. Time-And-One-Half Sea Service Credit.**

The time-and-one-half provision was put in the regulations to take into account the additional experience mariners obtain when they stand watches on a six-on, six-off watch schedule.

Time-and-one-half credit will not be given for overtime nor for other work days that do not involve six-on, six-off watchstanding even if the work days are more than eight hours long.

The six-on, six-off watch schedule should be proven to the satisfaction of the OCMI or their representative before the time and a half credit is applied. The following sources express this intent.

1. The Notice of Proposed Rulemaking (for the current licensing system), FR 35926, August 8, 1983, stated, "Many comments expressed concern about obtaining additional credit for 12 hour days in the case of people that work six on/six off watches. A statement has been added to a new definition section in the proposed regulations whereby any persons standing watches on any vessels upon which the six on/six off watch schedule may be used, will be given credit for 1.5 times each 12 hour day of service in that capacity."
2. House Report No. 96-1075 on Public Law 96-378 [H.R. 5164], which created our current system of Able Seaman ratings, states on page 27, "The eight-hour provision is primarily intended to assure that those mariners who work a two-watch system (that is, six hours on duty and six hours off duty for a total of twelve hours a day) will receive a day and a half of credit for each twelve-hour day worked."
3. Some inland vessels not subject to the 2 or 3 watch system have in place a 12 hour watch rotation. If the REC can verify that such a schedule is practiced and legal, day and a half credit may be granted.

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-2: EXAMPLES OF MILITARY EVALUATIONS (DECK)**

Note: The service presented must be equivalent to that required of a merchant mariner. The following methods of evaluation apply. All the sea service times referred to below are after all the appropriate deductions have been made.

Original Third Mate (except academy graduates)

Officer Sea Service:

Each day of DWO sea service is counted as two days of the required service for an original third mate's license. As an example 18 months sea service as DWO is equal to the 36 months of unlicensed sea service. Service as DWO is equivalent to licensed merchant marine watchstanding service rather than unlicensed service, therefore, more sea service credit can be given.

Officer sea service as other than a DWO is counted day-for-day towards an original third mate's license. The following are some examples of this type of deck service: CIC Officer, Navigator, JOOD, Assistant Navigator, 1st Lieutenant, Gunnery Officer and other duties associated with the operation of the vessel on deck.

This time cannot be used to duplicate service during the same time period that is being counted as watchstanding. When the non-watchstanding time exceeds that of the watchstanding time, the difference in the times may be used as 1 for 1 service. For example, if the Transcript of Sea Service shows 20 months as operations officer and 16 months as DWO during the same time period, the difference of four months can be credited, after applying a 60% reduction, on a 1 for 1 basis.

Enlisted Sea Service: Most of the ratings are explained in 46 CFR 10.213(b). The Navy has combined some ratings into operations specialist. Operations specialist is a combination of the ratings quartermaster, radarman, sonarman, and signalman. The evaluator must be careful when evaluating the operations specialist to ascertain the type of duties the applicant performed as it relates to the navigation and control of the vessel.

Combining Sea Service: When computing the 36 months (1080 days) required for a third's license, you may use a variety of service in combination. Care must be taken not to allow excess service when computing the license. Service is computed in the chronological order in which it was served. The following is an example:

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-2: EXAMPLES OF MILITARY EVALUATIONS (DECK) (Cont'd)**EXAMPLE OF THIRD MATE CALCULATIONS (NON-ACADEMY)**TRANSCRIPT OF MILITARY SEA SERVICE**

NAME: CDR Joe Goodship

CGC GALLATIN (WHEC)	SA/SN	8 MONTHS
GM3		24 MONTHS

CGC TACKLE (WYTL)	GM2/1	28 MONTHS
CGC POLAR STAR (WAGB)	ENS/LTJG	15 MONTHS 10 MONTHS DWO (UNDERWAY) 12 MONTHS 1ST LT. 3 MONTHS OPS OFFICER
CGC SASSAFRAS (WLB)	LT	12 MONTHS 12 MONTHS OPS OFFICER 8 MONTHS DWO

The following is an example of how to compute the sea service time for the above transcript:

COMPUTATION OF SEA SERVICE

SEA SERVICE REDUCED BY 60% (DAYS) = TOTAL SEA SERVICE (MONTHS)
X .6(60%) X 30 DAYS

<u>RANK/RATE</u>	<u>TOTAL SEA SERVICE (MONTHS)</u>	<u>SERVICE REDUCED BY 60% (DAYS)</u>	<u>SEA SEA SERVICE ALLOWED (DAYS)</u>
(1) CGC GALLATIN (over 1600 GT)	SA/SN GM3	8 24	144144 [^] 1 432180 [^] 2+126 [^] 3

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-2: EXAMPLES OF MILITARY EVALUATIONS (DECK) (Cont'd)**

1. 46 CFR 10.213(b) allows SA/SN sea service as equivalent to ordinary seaman service.
2. Section 2.B.4.d. allows up to 180 days of non-deck rating time (as defined in 46 CFR 10.213(b)) toward a Third Mate license.
3. The remainder of the 432 days after the 180 days is allowed can be given 50% credit as indicated in Figure 2-1 ($432 - 180 = 252$. $252 \times 50\% = 126$). [NOTE: Had the GM3 service been a deck rating, such as BM3, the sea service would be equivalent to the able seaman sea service required by 46 CFR 10.407(a)(1).]

(2). CGC POINT HURON GM3/2 24 432 0

(3). CGC TACKLE GM2/1 28 504 0

Both vessels are under 200 gross tons therefore the sea service cannot be used for this license.

(4). CGC POLAR STAR DWO 10 180 360
 (over 1600 GT) 1ST LT 5 90 90

Since the time here was as a DWO, each day of DWO sea service is counted as two days of required service or double the accrued time. As stated previously, this sea service is considered equivalent to watchstanding mate service.

(5). CGC SASSAFRAS DWO 8 144 288
 (over 200 GT) OPS OFFICER 4 72 72

TOTAL 1260

The Sassafras is under 1600 but it is over 200 gross tons so it can be used for up to 50% of the service required for an unlimited third's license. If more than 50% of the required service was on vessels under 1600 gross tons, a tonnage limitation would be computed for the third's license.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

79

Total: 360 Days/281 >1600

CDR Jones meets the sea service for chief mate AGTs. However, he has not served aboard a vessel of over 1600 gross tons since Burton Island in 1978. The recency provisions of 46 CFR 10.202(e) apply. He must have three months' qualifying experience on vessels of appropriate tonnage (all over 200grt, half over 1600grt) within three years of application.

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-2: EXAMPLES OF MILITARY EVALUATIONS (DECK) (Cont'd)**For Master

<u>Vessels</u>	<u>Credit</u>	<u>Notes</u>
Laurel	355	
Sedge	640	
Acushnet	493	CO
Total:	1488	< 1600

CDR Jones qualifies for Master 1600 gross tons because he does not have sufficient service on vessels of over 1600 gross tons. However, he may be permitted to sit for Master Unlimited with a 2,000 gross register ton restriction as permitted by 46 CFR 10.402(b).

1. Mariner qualifies for third mate after completing the Coast Guard academy and qualifying as a deck watch officer under, 46 CFR 10.407(a)(1)(iii).
2. Service is evaluated sequentially, in the order obtained over the course of the career. In this case, the mariner "uses up" service on vessels of over 1600 gross tons early in the career. In effect, the higher tonnage service was used to qualify at second and chief mate levels.
3. To qualify for an original master's license, the mariner must serve as Commanding Officer for at least 180 days, 46 CFR 10.213(a).

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-3 EXAMPLES OF MILITARY EVALUATIONS (ENGINE)**

Note: The service presented must be equivalent to that required of a merchant mariner. The following methods of evaluation apply. All the sea service times referred to below are after all the appropriate deductions have been made.

Original Third Assistant Engineer (except academy graduates)Officer Sea Service:

Each day of EWO sea service is counted as two days of the required service for an original Third Assistant Engineer's licenses. As an example, 18 months sea service as EWO is equal to the 36 months creditable sea service. Service as EWO is equivalent to licensed merchant marine watchstanding service rather than unlicensed service, therefore, more sea service credit can be given.

Officer sea service as other than a EWO is counted day for day towards an original third's license. The following are some examples of this type of engineering service: Main Propulsion Assistant, Electrical Officer, Auxiliary Officer, Damage Control Officer and any other duties associated with the engineering plant.

This time cannot be used to duplicate service during the same time period that is being counted as watchstanding. When the non-watchstanding time exceeds that of the watchstanding time, the difference in the times may be used as 1 for 1 service. For example, if the Transcript of Sea Service shows 20 months as main propulsion assistant and 16 months as EWO during the same time period, the difference of four months can be credited, after applying the 60% reduction, on a one for one basis.

Enlisted Sea Service: Most of the ratings are explained in 46 CFR 10.213(b). The Coast Guard has the rating of Machinery Technician (MK) that combines the Boiler Technicians (BT), Machinist Mate (MM), Damage Controlman (DC) and Engineman (EN).

Combining Sea Service: When computing the 36 months (1080 days) required for a third's license, a variety of service may be used in combination. Care must be taken not to allow excess service when computing the license. Service is computed in the chronological order in which it was served. The following is an example:

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-3: EXAMPLES OF MILITARY EVALUATIONS (ENGINE) (Cont'd)**EXAMPLES OF THIRD ASSISTANT ENGINEERS (NON-ACADEMY)TRANSCRIPT OF MILITARY SEA SERVICE**NAME: CDR Joe Goodship**

CGC GALLATIN (WHEC)	FA/FN	8 MONTHS
	DC3	24 MONTHS
CGC POLAR STAR (WAGB)	CWO2(ENG)	15 MONTHS
		10 MONTHS EWO (UNDERWAY)
		12 MONTHS MAIN PROPULSION ASST.
		3 MONTHS AUXILIARY OFFICER
CGC TAMAROA (WMEC)	CWO2(ENG)	12 MONTHS
		12 MONTHS AUX OFFICER
		8 MONTHS EWO (UNDERWAY)

The following is an example of how to compute the sea service time for the above transcript.

COMPUTATION OF SEA SERVICE

SEA SERVICE REDUCED BY 60% (DAYS) = TOTAL SEA SERVICE (MONTHS) x .6(60%) x 30 DAYS

RANK/RATE	TOTAL	SEA	SEA
	SEA	SERVICE	SERVICE
	SERVICE	REDUCED	ALLOWED
	(MONTHS)	BY 60%	(DAYS)
		(DAYS)	
CGC GALLATIN	FA/FN	8	144
7000 hp (5300 kW)	DC3	24	432
			144^1
			180^2

- 46 CFR 10.213(b) allows FA/FN sea service as equivalent to ordinary seaman service.
- Section 2.B.4.d. allows up to 180 days of non-engine room rating time (as defined in 46 CFR 10.213(b)) toward a Third Assistant Engineer's license. The computation gives 432 days but only 180 days can be used. [NOTE: In this example DC3 Goodship was not an engine room watchstander so per Figure 2-1, the service is not credited as engineer service. Had the DC3 service been as a watchstander or had it been an engine room rating such as MM3, the sea service would be equivalent to the QMED sea service required by 46 CFR 10.516(a)(1).]

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 2: EQUIVALENT SERVICE FOR LICENSES/MERCHANT MARINER'S DOCUMENTS****FIGURE 2-3: EXAMPLES OF MILITARY EVALUATIONS (ENGINE) (Cont'd)**

CGC POLAR STAR	EWO	10	180	360
18,000 hp	Dept. Head	5	90	90
(13,500 kW)				

Since the time here was as an EWO, each day of EWO sea service is credited as two days of required service or double the accrued time. As stated previously, this sea service is considered equivalent to watchstanding engineering service.

CGC TAMAROA	EWO	8	144	288
3000 hp	AUX OFFICER	4	72	72
(2200 kW)				
			TOTAL	<u>1134</u>

The Tamaroa is under 4000 hp (3000 hp) so it can be used for up to 50% of the service required for an unlimited third's license. If more than 50% of the required service was on vessels under 4000 hp (3000 kW), a horsepower (power rating) limitation would be computed for the third's license.

2. Rehabilitation Evidence	A3-8
G. Notice of Denial	A3-8

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW****A. Character And Violations Of Law.**

This chapter deals with the policies for rejecting applications for all Merchant Mariner's Documents (MMDs), licenses and Certificates of Registry (CORs) when there is substantial evidence that the criminal convictions, character or habits of life warrant the rejection. The evaluator must consider all aspects of the applicant's record. The applicant's record of convictions are our best source to determine if the applicant should be rejected. However, in some cases, the evaluator may have to make a determination from records other than convictions. There are few simple answers to whether an applicant is qualified. The evaluator should use any source available to determine the qualification of an applicant. See 46 CFR 10.103 and 12.01-6, for the court orders that are considered a conviction for the purposes of this chapter.

1. 46 U.S.C. Section 7101 authorizes the Secretary of the department or agency under which the Coast Guard is operating to issue licenses to applicants found qualified as to age, experience, professional qualifications, physical fitness, character and habits of life. In addition, the Coast Guard may issue a Certificate of Registry to applicants found qualified as to experience, knowledge, skill and character. 46 U.S.C. Section 7503(b)(1) provides that a license, COR or MMD application may be denied to any individual who, within ten years before making application, was convicted of violating a dangerous drug law of the United States. 46 CFR 10.201 and 46 CFR 12.02-4 address denial of license, COR, and MMD applications based upon narcotic convictions. Assessment periods are minimum and maximum periods of time over which the OCMI will consider a conviction(s) in the evaluation of an applicant for merchant mariner's credentials. Definitive guidelines for assignment of assessment periods to be used for the evaluation of applicants with various criminal and driving convictions were published in a Final Rule on December 19, 1995. [60FR65478 dtd December 19, 1995, "National Driver Registration and Criminal Record Review in Issuing Licenses, Certificates of Registry, or Merchant Mariner's Documents"].
2. 46 U.S.C. Section 7503 provides that an applicant may be denied a license or COR or MMD if they have been a user of, or addicted to, a dangerous drug, unless the applicant provides satisfactory proof of cure. Dangerous drugs are defined in 46 U.S.C. 2101 and mean a narcotic or controlled substances including marijuana.
3. Before Congress enacted the Oil Pollution Act of 1990 (OPA-90), (Pub. L. 101-380), an individual who applied for a license, COR or MMD was not required to provide the Coast Guard with National Drivers Register (NDR) information. OPA-90 amended laws which now require the Coast Guard to review the applicant's driving record for certain NDR listed traffic offenses before issuing a license, COR or MMD. These offenses include operation of a motor vehicle while under the influence of, or while impaired by, alcohol or a controlled substance; any traffic violation(s) arising in connection with a fatal traffic accident, and reckless driving, or racing on the highways.

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW**

Although an individual's motor vehicle record may not be directly related to his or her maritime career, a record of alcohol or drug related, or other motor vehicle offense(s) indicates that the individual may have a disregard for his or her own safety or the safety of others and therefore may not be suitable for maritime employment. Information received from the NDR must be made available to the applicant for review and written comment before the Coast Guard uses this information as a basis for denying an application for a license, COR, or MMD.

4. Persons who have a record of certain criminal convictions may be viewed as lacking appropriate character and hence denied the privilege to act as a licensed officer or MMD holder. Unacceptable character traits or habits of life may be demonstrated by criminal convictions for murder, assault, rape, theft, child molestation and related crimes, or through demonstrated repeated disregard for the rules and regulations of an orderly society (convictions for disorderly conduct, reckless driving and similar violations of law). Due to complex combinations of convictions and other variables, a simple matrix of acceptable versus unacceptable criminal backgrounds is not practicable. Each applicant must be evaluated individually to determine their qualification for a license, COR, or MMD. Factors to be considered should include at least the following:
 - a. Types of crimes and the number of convictions.
 - b. Recency of convictions.
 - c. Age at which the crimes were committed.
 - d. Evidence of frequent and repeated criminal activity (includes misdemeanors and/or felonies).
 - e. The extent of the connection between the crime and the license or COR and the safe and legal operation of a vessel.
 - f. Character references from responsible persons in extenuation and mitigation.
 - g. The length of time spent since release from incarceration or supervised parole.
5. Any applicant who holds or is eligible to renew a license, COR or MMD, who has been convicted of a drug related crime, or has admitted to using or been reported to have used narcotics, or has been convicted of an NDR related offense within the past three years will be referred to the Senior Investigating Officer (SIO) for an investigation prior to processing the applicant's requested transaction.
6. Evaluating the Crime(s): See section 3.C of this volume.
7. Evaluating Multiple Convictions: See section 3.C of this volume. Multiple convictions may indicate a history of flagrant disregard for the rules of an orderly society. In such cases, the minimum assessment period will be the longest minimum in the regulations, based upon the applicant's convictions. The maximum assessment period will be the longest shown in the regulations.
8. OCMI Discretion: Each case must be evaluated individually. The reason for any assessment period must be well documented in the applicant's file.

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW****B. Guidelines For Rejecting Fraudulent Applications.****1. Original Applications.**

Failure to complete an initial application truthfully can lead to its consideration as fraudulent and to the voiding of any license, certificate, or document issued under such an application ab initio (as if never issued). When it has been determined that statements in an application were fraudulently made and not merely the result of unintended misstatement or misunderstanding, the applicant shall be required to wait 12 months before he/she can reapply. If it is later determined that an initial license, COR or MMD, was issued based on fraudulent information, that license, COR, or MMD should be considered "null and void" and must be returned to the REC. After the assessment period expires, the applicant must start the application process from the beginning. When a license, COR or MMD is denied or declared "null and void", the OCMI shall advise the holder of the appeal rights contained in 46 CFR 10.204 and/or 46 CFR 12.02-25.

2. Subsequent Applications.

A license, COR, or MMD shall not be reissued to an applicant if, during the re-application process, a fraudulent application is discovered. A license, COR, or MMD renewed by way of a fraudulent application may not be declared "null and void". Instead, the mariner must be provided with an administrative hearing conducted under 46 CFR Part 5 where the credential may be revoked for misconduct. Such cases should be referred to the SIO.

C. Evaluation Of Records Of Convictions.

This section addresses various factors to consider when evaluating an applicant who has a criminal record, including DWI/DUI convictions. If the applicant holds or is eligible to renew a license, COR or MMD the SIO should be advised. The application process is then put on hold until the SIO advises on the outcome of an investigation. This requires close liaison between the Coast Guard Chief, Regional Exam Center and the SIO. If the application is for an initial license, COR, or MMD, the process is also placed on hold pending the outcome of a criminal and NDR records review by the REC.

1. Types Of Convictions.

Criminal convictions may serve as the basis for disqualifying an applicant for a license, COR or MMD. Some examples of criminal convictions that may disqualify an applicant include convictions for violations of national security laws; capital offenses such as first degree murder; armed robbery; rape; assault with a deadly weapon; embezzlement; other serious felony crimes; and crimes of moral corruption (see section D). Other criminal convictions may also serve as grounds for disqualifying an applicant for a license, COR or MMD for a reasonable period of time (assessment period). During the assessment period the applicant is given the opportunity to demonstrate rehabilitation. A reasonable period of time is generally a number of years from the date of conviction or release from jail and/or supervised probation, whichever is later. (see section D).

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW**2. Number Of Convictions.

Multiple criminal convictions may be more of an indication of an applicant being unqualified than convictions for multiple criminal charges arising from a single criminal incident. In judging multiple convictions, care should be used to discern if the convictions arise from multiple charges for a single incident or numerous incidents of criminal activity or over a long period. A single incident can result in multiple convictions for different crimes. Convictions for robbery, drug possession, assault and rape may stem from one event. Closely related to multiple convictions for a single incident is the concept of repeat offenders. Persons with a long string of criminal convictions, particularly for such serious crimes as murder, theft, robbery or burglary, sodomy or even less serious crimes and violations showing a flagrant disregard for the rules of an orderly society are unsuitable to hold a license, COR or MMD. Such persons, by their habits of life, have demonstrated that they cannot be trusted by society in general; thus, absent suitable evidence of rehabilitation, they certainly cannot be entrusted to perform the duties of a merchant mariner.

3. Recency Of Convictions.

Some persons rehabilitate themselves after conviction and become worthy of the trust required to hold a license, COR or document. A lack of recent convictions since any period of incarceration may be evidence of rehabilitation. However, generally, an assessment period should not be less than one year.

4. Additional Evidence Of Rehabilitation Or Reform.

In addition to time without subsequent convictions, there are other acceptable ways to demonstrate rehabilitation or reform. One of the most common is through the use of character references. These references should be carefully considered before being accepted. Parole officer recommendations may be considered. Character references which indicate knowledge of the applicant's convictions and attest to a demonstrated change in character or habits of life, with examples of how the applicant's behavior has changed, are generally more worthy than those which simply extol the applicant's virtues, e.g., those written without any knowledge of the applicant's history. Given the role drugs and alcohol often play in criminal activity, long-term participation in Alcoholics Anonymous, Narcotics Anonymous or other similar programs with support groups may be accepted as some evidence of rehabilitation or reform.

5. Relevance Of The Offense To The License, COR, or MMD Applied For.

Special relevance resides in the presence or absence of opportunity for the holder of a license, COR, or MMD to repeat their previous crimes while on the job. For example, a conviction for drug trafficking is particularly relevant when an applicant has requested a license, COR or MMD. Having a seafarer's document presents the opportunity to smuggle and traffic in controlled substances. This type of activity could also lead to impairment of the seafarer caused by the use of a controlled substance and endanger life or property at sea.

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW**6. Incarceration.

A period of time without conviction is evidence of reform only when there is opportunity to demonstrate a rehabilitated life style. Time in prison will not count toward any of the assessment periods suggested in these guidelines. A period of time to interact with society is necessary for a person to prove they can successfully abide by society's laws and regulations. However, consideration should also be given to bad acts while in prison. Prisoners commit crimes while incarcerated. Such a record of behavior may be considered as evidence of a lack of rehabilitation. Time in prison will not be considered for any assessment periods required before issuing a license, COR or MMD.

7. Probation.

An applicant's parole/probation status is a factor in deciding if the applicant is qualified. An applicant in a closely supervised parole/probation status is not as trusted by society as is someone on unsupervised parole/probation. Time on supervised parole/probation should be given less weight and may be excluded entirely from any assessment period. However, the OCMI may include periods of probation and parole in the assessment periods with a letter of recommendation from a parole or probation officer. 46 CFR Parts 10.201(h)(2) and 12.02-4(c)(2) have been recently revised to clarify when assessment periods begin. Time on parole/probation may be considered for evidence of rehabilitation if all the conditions of the parole or probationary period were properly fulfilled. Conditions of the parole/probation should also be examined by contacting the appropriate court officer. Frequently conditions of parole/probation prohibit the individual from leaving the jurisdiction of the state or district in which the individual was convicted. This prohibits employment that is inconsistent with the conditions of the parole/probation.

D. Evaluating Criminal Behavior.

The following guidelines should be applied when evaluating applicants with criminal convictions. When evaluating the criminal convictions record, remember they had their day in court, defended by legal counsel. Do not allow yourself to be placed in the position of retrying the evidence that led to the conviction. The applicant will generally try to minimize the outcome of the conviction by introducing their perception of why they were convicted. This view is self-serving. Convictions must be taken at face value. In most cases you should insist upon a copy of the court's Decision and Order (D&O) or its equivalent. The D&O will show the charges and their outcome. Some will be more detailed, giving a short background of the case. When evaluating the qualifications of an applicant for a license, COR or MMD use the factors of section 3.C. and 3.A.4. as your guide. The assessment periods listed in 46 CFR Part 10.201(h) and 12.02-4(c) respectively, should be considered as suggested minimums and maximums. The evaluator must use judgment in deciding reasonable assessment periods.

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW****E. Dangerous Drug Offenses.**

46 U.S.C. 7503 gives the Coast Guard authority to disqualify an applicant for a license, COR or MMD to any individual who has been convicted of a drug law violation within ten years preceding the date of application or who has ever been a user of or addicted to the use of a dangerous drug, including marijuana. However, the authority to disqualify an applicant is qualified in several ways. First, the statutory time limit on considering a conviction of this sort is a maximum of ten years from the date of the conviction. Second, an applicant who has been addicted to or a user of a dangerous drug may be evaluated if the applicant provides satisfactory proof of cure.

1. Drug Use Or Addiction.

Drug users must present strong evidence of reform/rehabilitation and a change in life-style in order to be considered for a license, COR or MMD. To show cure, as determined in the Vice Commandant's Decision on Appeal No. 2535 (SWEENEY), the RECs should consider the following information when reviewing applications of those who have been addicted to, or users of, dangerous drugs.

- a. Medical evidence of a cure. Cure is shown by completion of a bona fide drug abuse rehabilitation program designed to eliminate physical and psychological dependence. This is interpreted to mean a program certified by a government agency, such as a state drug/alcohol abuse administration or in the alternative, certified by an accepted independent professional association, such as the Joint Commission on Accreditation of Health Care Organizations (JCAHO); and
- b. Evidence that following the successful completion of the drug rehabilitation program, the applicant has demonstrated a complete non-association with drugs for a minimum of one year (SWEENEY, supra) or in accordance with present regulatory time requirements (46 CFR, part 5). This includes participation in an active drug abuse monitoring program which incorporates random, unannounced testing during that year.

2. Drug Convictions.

An applicant with one conviction, which is over a year old, for a small amount of marijuana may be eligible for a license or document before the expiration of a minimum assessment period. As an example, if the applicant completed any assigned periods of parole or incarceration and the conviction is over one year old with no other involvement (e.g., trafficking) the OCMI may consider issuing a license before the minimum assessment period has elapsed. Certain criteria must be met before this can take place. The OCMI must determine the applicant's involvement in the conviction. If the applicant was convicted of possession of a small amount of marijuana but did not use the drug and can furnish satisfactory proof from a drug counselor that the individual did not and is not using drugs, then the OCMI may issue the license or document. If an applicant has multiple convictions for drugs other than marijuana or trafficking, especially if the convictions are maritime related, the denial could extend to the full ten years. The length

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW**

of time will be a function of the number and seriousness of the convictions and their relationship to the license, COR or MMD applied for.

3. Drug Arrests Without Convictions.

Absent a conviction, admission of use or admission of addiction to dangerous drugs may be grounds for disqualifying an applicant for a license, COR or MMD. A person may truthfully answer "no" to questions on the application concerning convictions, however, an arrest(s) may be an indicator that the applicant is or was a user of the dangerous drugs indicated on the arrest record. As such, they may prompt the evaluator to ask further questions to determine if the applicant was or is a drug user. A delay in the issuance of a license or document pending the results of a criminal records check may be encountered.

F. Alcohol Related Convictions.

Convictions for driving while intoxicated/driving under the influence are considered to be more than minor traffic violations and reflect unfavorably on the applicant's suitability to be entrusted with the duties and responsibilities of the license. They must be noted in Section VI of the application, or by a separate notation on the application. Applicants indicating conviction(s) of vehicular crimes shall be assigned minimum or maximum assessment periods in accordance with the regulations.

1. Driving While Intoxicated/Driving Under The Influence Of Intoxicants (DWI/DUI).

DWI/DUIs are serious matters and may indicate that an applicant should not be entrusted with the duties and responsibilities of a license, MMD or COR. Each applicant must be evaluated on an individual basis to determine if the DWI/DUI conviction(s) is indicative of a deeper problem affecting the applicant's qualification to hold a license, COR or MMD, or is the result of a single isolated failure of judgment. In evaluating applicants with DWI/DUI convictions, the evaluator must qualify the applicant based on the convictions, taking into consideration the number and severity of the convictions, recency of the convictions and evidence of rehabilitation/reform. The following guidelines offer additional factors for evaluating the qualification of an applicant with DUI/DWI convictions.

a. Single Conviction.

A single DUI/DWI conviction within the past three years may indicate the early stage of a developing, long-term problem, or that the individual having a well-developed problem was only caught once, or that this was an isolated incident of poor judgment. The evaluator should attempt to identify which of the possible scenarios is applicable.

(1) In cases where a long-term problem is developing and the conviction is over one year old, but less than three, the application should be processed unless a suspension or revocation is still in effect for a state driver's license. The applicant should be put on notice, in a letter, that their license may be in jeopardy.

(2) If the conviction is more than three years old, a conviction clearance is normally not necessary.

PART A: MARINER CREDENTIALING**CHAPTER 3: EVALUATION OF CHARACTER ISSUES AND VIOLATIONS OF LAW**

(3) If the conviction is less than one year old, the application should be denied for a period of time sufficient to see if another incident will occur (at least one year from the date of the conviction).

b. Multiple Conviction.

For multiple convictions, the most recent being more than three years old, the application should be processed. The applicant should be put "on notice", in a letter, that further occurrences may jeopardize their license. If the applicant has multiple convictions, with any within the last three years, the evaluator may consider disqualifying an applicant for the license for at least one year since the last conviction and at least three years since the second most recent conviction unless satisfactory cure is shown.

2. Rehabilitation Evidence.

Acceptable evidence of rehabilitation/reform include the following: successful completion of an alcohol abuse treatment or education program; long term active membership in therapy, such as Alcoholics Anonymous; or positive character references from responsible persons who can attest to the applicant's long period of being sober and reliable and outlining the applicant's change in behavior since their offense.

G. Notice of Denial.

In all cases when an applicant is denied a license, COR or MMD, they must be notified by letter. The letter must include the reason for the denial, any remedy (e.g. assessment period, time off parole/probation, etc.), the right to appeal and the appeal process.)

PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

A. Physical Examinations.

Merchant Marine Personnel Physical Examination Report, Form CG-719K, is submitted with the application for a license or MMD when a physical examination is required. Any questions relating to physical requirements may be directed to the National Maritime Center. Guidance to assist medical personnel in conducting these examinations is found in NVIC 2-98.

B. Qualified Medical Personnel.

Physician will be used in this chapter to mean a licensed medical doctor (including doctors of osteopathy (D.O.)), a licensed physician assistant, or a licensed nurse practitioner. The above medical personnel must be licensed by a state in the U.S., a U.S. possession, or a U.S. territory. Foreign medical licenses are not accepted. A chiropractor is not acceptable as a physician; see 46 CFR 10.205(d).

C. Completing The Merchant Marine Personnel Physical Examination Report (Form CG-719K).

One of the major concerns of an evaluator is having the CG-719K completed properly. The CG-719K must be completed and signed by a physician. The license number, the state issuing the license, the address and telephone number of the physician must be included on the CG-719K. A random number of CG-719K's should be verified with the physician to check the information on the form. If any of the notations on the form are unreadable, unknown, or omitted, a quick call to the signer may clear up any misunderstanding and verify the applicant's condition. The evaluator is responsible to ensure that the applicant provides satisfactory evidence to show that he or she meets the physical requirements of the regulations. It is the applicant's responsibility to provide the necessary medical information to evaluate the application. If the information from the physician is incomplete or unacceptable, return the CG-719K to the applicant to obtain the required information.

D. Physical Standards.

The conditions discussed in this chapter are considered to be potentially disqualifying for the purpose of obtaining a license or MMD. They are not intended to be absolute or all-encompassing. One applicant could be unqualified due to a condition not listed here, while another applicant could have a listed condition and be qualified for a waiver. Waivers may be considered where extenuating circumstances are such as to warrant special consideration.

E. Unlicensed Seaman Physical Standards.

46 CFR Part 12, Certification of Seamen, refers to 46 CFR 10.205(d) when setting standards for unlicensed seamen. The following is a list of ratings and the standards they must meet:

1. Able seamen must meet the same physical standards as a licensed master, mate, or pilot.
2. Qualified member of the engine department (QMED) must meet same physical standards as a licensed engineer.
3. Tankermen must meet the same physical standards as a licensed engineer.

PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

F. Waiver Statements.

There is no regulation that requires the seaman to notify the REC when a physical waiver condition worsens during the license period. To prevent possible injury to the seaman and prevent a vessel from becoming unseaworthy the following statement will be placed on the license/MMD. "Any deterioration of a waived medical condition shall be immediately reported to the nearest REC." Under certain conditions OCMI's are authorized to grant waivers for the physical standards. This authorization does not prevent the OCMI from asking advice or further evaluation from NMC. Listed below are the standards for local waivers.

1. Vision.

There are two areas of concern with vision. One is the ability of the applicant to see at a distance (visual acuity) and the other is the ability to distinguish colors (color sense).

a. Visual Acuity Waiver.

Corrected visual acuity must always be at least 20/40 for deck officers and at least 20/50 for engineering officers (46 CFR 10.202(f)). All REC's are authorized to grant waivers to applicants who have an uncorrected vision no worse than 20/800 under the following conditions:

- (1) The applicant may not have a degenerative condition that would speed the deterioration of their eyesight. All applicants with diabetes must submit documentation from their doctor that the diabetes is not affecting the applicant's eyesight.
- (2) The license must contain a vision waiver notation that requires the mariner to wear the corrective lenses (contacts or glasses). A spare set of glasses (not contact lenses) must also be carried aboard the vessel for all individuals with a vision waiver.
- (3) The applicant must have 100 degrees, horizontal field of vision.
- (4) Every applicant with uncorrected vision of 20/400 to 20/800 must wear corrective lenses (contacts or glasses), and carry a spare set of glasses on their person. If glasses are worn, they must have an attached restraining device to keep them securely in place.

b. Color Vision.

The required tests for color vision are specified in the regulations and on the reverse of the Form CG-719K for deck officers. A deck officer must pass one of these prescribed tests. An exception may be made for restricted Inland routes. They may have their licenses endorsed "Vision Waiver: Restricted to daylight operation only." In granting a waiver the area (route) of operation must also be considered. If it is unreasonable to expect that the applicant would be able to comply with this restriction, additional area restrictions may be placed on the license. An example would be a license limited to a specific geographic area, e.g., "Montauk Point, N.Y. to Martha's Vineyard." The expectation is that the licensee would be able to comply with the daylight only operation.

PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

c. Monocular Vision.

Monocular vision is the ability to see with one eye only. A person may have both eyes functioning but due to a problem, such as cross fixation (cross-eyed), they have limited or no depth perception. These cases should be referred to NMC. For raise of grade or renewal applications, monocular vision is addressed in 46 CFR 10.207(e)(3) and 10.209(d)(3), respectively.

2. Hearing.

Hearing acuity presents two concerns for the evaluator. One is the unaided hearing response to certain frequencies and the other is speech discrimination ability at 55 decibels (dB).

a. Decibels (dB).

This is a measure of the power or loudness of sound. The higher the number, the louder the sound. Someone who can hear a 20 dB sound has better hearing than someone who can only hear a 60 dB sound. Normal conversation is at 55 dB, hence the speech discrimination test at 55 dB.

b. Standards.

Hearing shall be evaluated in accordance with NVIC 2-98.

c. Hearing Aid Waiver.

(1) Deck Department. Deck department personnel who cannot meet the above requirements may use hearing aids. Mariners with hearing aids who meet the auditory requirements of NVIC 2-98, may be granted a waiver by the OCMI. The license or MMD must show that a waiver was issued.

(2) Engineering Department. Hearing aids may not be used to meet the auditory requirements for Engineering licenses or MMDs. Concerns in the engine room include negative effects of hearing aids around loud noises. However, in some cases, impaired hearing is no worse in the engine room than an individual with hearing protection on. Outside the machinery space, such as the control room, an individual would likely need the hearing aid to use a telephone or to respond to audible console alarms. Engineers (licensed and/or documented) must be able to hear telephone bells/buzzers, general alarm bells, and CO2 sirens without aid in the engine room. A letter attesting to this ability shall be provided by the applicant from the vessels chief engineer or master. A waiver notation, if granted, shall be added to the license or MMD. Questionable cases should be referred to NMC for further review.

PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

d. Other Hearing Waiver.

Other conditions that do not meet the situations described above may be considered for a waiver when recommended by the OCMI. Such cases will be evaluated by NMC.

3. Mind Altering Drugs (Psychotropic Drugs).

Drugs used to treat psychiatric disorders are called mind altering or psychotropic drugs. Applicants requiring these drugs are no longer automatically considered ineligible for a license or MMD. Conditions treated by psychotropic drugs are separated into two distinct categories; psychosis and/or neurosis

- a. Waivers should be considered on a case by case basis for individuals with neurotic disorders (anxiety or depression). Supporting data shall include a strong recommendation from the attending physician confirming no adverse side affects from the medication over a one year period.
- b. Waivers are not normally approved for individuals with psychotic disorders (manic depression, schizophrenia). Although a person may have demonstrated control of the condition, it is not unusual that patients feel well and decide to reduce or stop medication. They often regress without realizing it. Given the limited resources available to assist a vessel's crew (as opposed to what is available ashore), an unacceptable risk to the vessel and crew may develop. All such cases shall be forwarded to NMC for evaluation. If a determination is then made that the mariner is competent to have a waiver granted, the license/MMD shall be endorsed with the appropriate waiver statement. "Physical Waiver: This waiver is granted on the condition that there is no further degradation of your condition. Any degradation shall be immediately reported to the nearest Coast Guard Regional Examination Center."

G. National Maritime Center Waivers.

Medical conditions that are beyond the scope of the REC to evaluate shall be referred to NMC. See paragraph 4.H for a discussion of those conditions.

1. As all waiver requests are from the **OCMI** and not the applicant, the applicant need not provide a letter requesting a waiver.
2. The request for a waiver should be sent directly to NMC. These requests are no longer required to be reviewed by the District offices.
3. Send only copies of the medical file and the current application package. [REMEMBER, COPIES ONLY].

PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

H. Medical Conditions Needing Further Review.

The following is a discussion of the medical conditions requiring further review by NMC.

Although not all inclusive the medical conditions discussed cover those most frequently seen.

1. Diabetes.

A physical waiver is required for all applicants seeking an original, renewal, or upgrade of a license or MMD who have insulin-dependent diabetes or poorly controlled non-insulin dependent diabetes (see figures 4-1 and 4-2). In order to be considered for a waiver, applicants must provide thorough amplifying written information from their physician including statements covering;

- a. A brief history of the applicant's diabetes, including when the diagnosis was made;
- b. The extent of applicant's diabetes education by topics (for minimum requirements see Figure 4-1);
- c. Description of any hospitalization in the past 12 months;
- d. A description of the applicant's control of the diabetes;
- e. If insulin-dependent, the applicant's ability to monitor his/her blood glucose and adjust his/her insulin dosage;
- f. A description of any other chronic medical conditions;
- g. A list of the applicant's medications, dosage, and required dosage frequency;
- h. Length of time the applicant has been on the current dosage;
- i. Copies of the applicant's medical record entries for the past 18 months; and
- j. A copy of the laboratory report of glycosolated hemoglobin (HgbA1c), within the past 30 days. NOTE: Waivers will not be granted when test results are 10.0 and over as this indicates poor control.

2. Cardiac.

Cardiac infirmities are often beyond the scope of the RECs to handle. The list below indicates those conditions requiring further information, and most likely, a waiver. Cardiac medication is a good indicator that a significant coronary condition exists. When submitting the case for a waiver review a recent (less than 12 months old) stress test will be required.

a. History Of Myocardial Infarction(s).

Any such history must be described in the attending physician's report including "class" (class III or IV) of myocardial infarction(s).

PART A: MARINER CREDENTIALING**CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS**

- b. Surgery.
Any cardiac surgeries, including cardiac pacemaker implant, bypass, etc., require further evaluation and thorough description(s) in order to facilitate thorough analysis by Headquarters medical staff.
- c. Heart Irregularity.
Irregularity sufficient to compromise cardiac function.
- d. Hypertension.
Uncontrolled hypertension or hypertension controlled by medication requiring close monitoring. Applications indicating uncontrolled hypertension or control by reserpine, guanethidine, guanadrel, methylopa, clonidine, or guanabenz must be evaluated by NMC. If the applicant's hypertension is controlled by diuretics, beta-adrenagic blocking agents, labetalol, hydralazine, minoxidil, prazosin, captopril, or calcium slow channel blocking agents, no further evaluation is required unless additional complications are noted by the examining physician.
- (1) original Licenses. Blood pressure higher than 150/90 regardless of treatment with medication.
- (2) Renewal Or Raise Of Grade. Blood pressure higher than 160/100 if under age 50 or 175/100 if 50 or over, on medication.
3. Physical Handicaps.
Conditions such as loss of limb or restricted motions of limb require a practical demonstration of ability. These demonstrations determine if an applicant can safely perform all duties entrusted to him/her by virtue of holding a license. The OCMI shall recommend the extent of the test to NMC for approval prior to the demonstration. If possible, an underway practical examination should be performed. The license may be approved at the local level with the OCMI imposing any necessary limitations.
- a. Operator of Uninspected Towing or Passenger Vessels (OUTV, OUPV) and Master Or Mate Of Less Than 200 Gross Tons.
A practical demonstration shall include the following elements:
- (1) Handling of mooring lines.
 - (2) Climbing and descending the vessel's ladder.
 - (3) Reaching, handling, grasping, and lifting lifesaving and fire fighting equipment required by the vessel's COI or applicable regulations.
 - (4) Donning and properly wearing a personal flotation device (PFDs); Helping passengers don PFDs; Casting ring buoys.
 - (5) Properly operating fire fighting equipment.
 - (6) Recovering a person who has fallen overboard.

PART A: MARINER CREDENTIALING**CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS**

- (7) Rendering first-aid to a person who may be unconscious or otherwise incapacitated.
 - (8) Using shipboard tools to repair a mechanical breakdown.
 - (9) Properly use navigation/communication equipment if applicable.
- b. Deck And Engineer Officer Licenses.
A practical demonstration shall include the following elements.
- (1) Climbing and descending the ship's ladder.
 - (2) Climbing and descending a Jacob's ladder.
 - (3) Opening and closing watertight doors.
 - (4) Exiting vessel via emergency routes.
 - (5) Rowing a lifeboat.
 - (6) Wearing an emergency breathing apparatus.
 - (7) Reaching, handling, grasping, and lifting lifesaving and fire fighting equipment required by the vessel's COI.
 - (8) Donning and properly wearing a personal flotation device (PFD) and casting ring buoys.
 - (9) Deck Officers must handle mooring lines and operate winch controls.
 - (10) Engineers must operate valves and related machinery control equipment.
 - (11) Properly use navigation/communication equipment if applicable

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

FIGURE 4-1: COMPREHENSIVE DIABETES EDUCATION PROGRAM

To include but not limited to:

1. The disease and its complications.
2. Diet management and weight control.
3. Types of insulin, characteristics and uses.
4. Storage, handling and administration of insulin.
5. Monitoring blood glucose.
6. Self-adjustment of insulin dosage in response to trends in blood glucose monitoring.
7. Effects of illness, injury, stress, heavy manual labor, exercise and other factors on diabetic control, insulin dose and diet.
8. The applicant's recognition when there is a loss of diabetic control

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 4: PHYSICAL REQUIREMENTS FOR MARINERS

FIGURE 4-2: RECOMMENDED CHECKLIST FOR DIABETES

(REC USE ONLY.) This list is for the REC to use to ensure that sufficient information is being given for the waiver. Do not send this list to the doctor.

1. Physician's statement that:

- applicant has completed a comprehensive diabetes education program.
- no hospitalizations within the last 12 months.
- applicant's diabetic control is stable.
- has total insulin dose per day varied less than ten units up or down (e.g., total range less than 20)?
- applicant is able to maintain diabetic control by monitoring blood glucose and appropriately adjusting insulin dosage.
- copies of medical record entries for last 18 months.
 - are there at least three entries?
 - are there less than six entries?
- the record supports the statement that the disease is stable. Any doubts refer to G-NMC-4C.
- no evidence of other significant conditions or diabetes- related illnesses.
[NOTE: Many illnesses may not be apparently related to diabetes; any doubts refer to G-NMC-4C.]
- Test: HgbA1C within one month of waiver request.
 - within normal limits?

2. Applicant's statement that:

- no hospitalizations within the last 12 months.
- he/she is capable of maintaining diabetic control by:
 - monitoring blood glucose.
 - adjusting insulin dose and other relevant factors.

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

A. Examinations.

When an applicant's experience and training meet the requirements of the regulations, and they are eligible in all other respects, they must be examined if required by the regulations.

1. Examination Guides.

The content of each deck examination including unlicensed examinations, is found in Commandant Publication P16721.35, Guide for Administration of Merchant Marine Deck Examinations (Deck Guide). Commandant Publication P16721.47, Guide for Administration of Merchant Marine Engineering Examinations (Engine Guide) contains similar information about the engineering examinations. Both guides provide information about the number of modules in the examination, grading procedures, and special instructions necessary to administer the examination.

2. Exceptions To Examination Requirements.

An applicant is not required to be tested in the following situations:

a. Regulatory Exceptions.

The licenses specified in 46 CFR 10.903(b) do not require an examination. In addition to these, the holder of a license issued under Subchapter B of the regulations revised in 1987, as master or mate of vessels of 500 gross tons, is not required to test for an increase in scope to 1600 gross tons on the same route. However, applicants holding a master 500 gross tons license received prior to the 1987 revisions, who have not taken the master 500/1600 gross tons exam, and apply to raise their license to master 1600 gross tons, must take the appropriate exam. A master or mate licensed for vessels of less than 200 gross tons on any rivers route may have the tonnage limitation increased up to 200 gross tons (same route) based on service only.

b. Removal Of Limitations.

A license with a special limitation imposed by an OCMI may not require an examination for removal of the limitation. No further examination is required if the original examination was of sufficient scope and depth for the change. In special cases involving the lifting of limitations, where the Commandant's evaluation is desired, the request submitted to the National Maritime Center should contain all information pertinent to the current limitation, including the license file from the issuing office, if available. If the license file is not available, the reason for the limitation shall be obtained from the issuing office and stated in the request.

3. Standard Modules.

There are over 1,000 modules supporting the deck exams and over 200 in support of the engineering exams. These modules are centrally stored on computer and downloaded at the REC when needed. They are periodically replaced, with some modules replaced each month. Modules that are used extensively, such as the Rules of the Road modules and those used for lower level licenses, are replaced more frequently. If an applicant requires a module, but it can not be downloaded in time, contact the Examination Administration Branch at the National Maritime Center. The module will be forwarded by a suitable medium, including FAX, E-Mail or overnight mail, to meet the examination date. If frequent or continuous problems with downloading are experienced, assistance must be sought through the system specialists, Commandant (G-MRI) at (202) 267-0790.

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

4. Local Examinations.

While the standard modules meet the requirements for most examinations, some situations require examinations prepared for local conditions. In these situations, the following guidelines apply:

a. Number Of Questions.

The number of questions in a locally prepared examination should not exceed the number of questions in a standard exam for a comparable license. If possible, the total number of questions should be such that the passing grade equates to an exact number of correctly answered questions.

b. Question Selections.

The examiner shall select questions based on the following factors: (1) Suitability of the individual questions for the license; and (2) Overall coverage of the subject.

c. Modification Of Standard Modules.

Often, a standard examination module may be modified to serve as a locally prepared examination by deleting questions that do not apply to the testing situation.

d. Local Knowledge For Pilot's Examinations.

RECs testing applicants for pilotage routes shall develop a module titled "Local Knowledge". If the route includes areas outside the zone of the parent MIO/MSO, the cognizant OCMI shall be consulted for local information about the area within that zone. The questions included in the local knowledge module may include anything particular to the pilotage route. Typical subjects for testing in local knowledge include: traffic separation and advisory schemes, weather, route description, currents, tides, prominent landmarks, geography, bottom configuration, local communications, availability and capability of tugboats, etc. This list is not all inclusive and not all of the above will apply to each route. For grading purposes, this is a practical navigation module (see Para 5.A.4.f.).

e. Chart Sketch.

- (1) RECs must develop standards for the chart sketch required of pilotage applicants. These standards may include, but are not limited to the symbols required, depth information, horizontal and vertical clearances, types of aids to be shown, courses and distances, shoals, reefs, and other underwater hazards, grading procedures, etc. In grading a chart sketch any information shown that would hazard a vessel is grounds for failure. For example, if a narrow channel runs 304 degrees true for 1.8 nautical miles and the applicant shows the channel at 314 degrees true, this is cause for failure. Omission of minor or inshore aids not directly affecting the route are minor errors. While each minor error is usually not sufficient grounds for failure, an accumulation of them indicates a general unfamiliarity with the route. Each REC must set the standards for the various pilotage routes within their zone(s).

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

- (2) Whenever possible, provide applicants with the outlined paper to be used in the chart sketch. If there are no local resources to print these outlines, the applicant may trace them from a chart while in the exam room. Applicants will not be permitted to bring an outline with them since pin-pricks, faint markings, incidental markings, folds, etc. could provide clues to the information required to be drawn on the sketch.
- f. Grading Of Nonstandard Examinations.
The passing grades for nonstandard examinations should be similar to the passing grades for the standard examinations. The passing grades for the standard examinations are:
- (1) Practical navigation (licenses not more than 100 gross tons) - 70%.
 - (2) Practical navigation (licenses over 100 gross tons) - 90%.
 - (3) Rules of the Road - 90%.
 - (4) All other deck and engineering subjects - 70%.
5. Orally Assisted Examinations.
Orally assisted examinations are permitted by 46 CFR 10.205(i). Applicants should attempt the standard written examination initially. If they demonstrate difficulty in reading, they may test with an orally assisted examination. This is a time consuming process. Encourage applicants to test with the standard modules and advise them of the limitations to be placed on the license. The following procedures shall be followed in administering an orally assisted examination. **Only the OCMI/REC is authorized to administer an orally assisted examination.**
- a. Standard Modules.
Candidates will normally be tested with standard examination modules unless a locally prepared module is appropriate.
 - b. Reading Of Questions.
The examiner shall read the questions to the applicant exactly as they are printed in the module. Read the questions in a normal tone of voice with the proper inflections as indicated by normal usage of the English language. When reading the four possible answers, read each one with the same tone. Do not stress or give any other indication of the correct answer. Questions may be repeated once to ensure understanding by the applicant. Do not discuss the content or meaning of either the questions or the possible answers.
 - c. Recording Of Answers.
Record the answers on a standard answer sheet. If standard modules are used to test the applicant, a notation to this effect shall be enclosed in the applicant's file. If locally prepared modules are used, the subjects included in the test must be listed in the file as indicated in 46 CFR 10.205(i).

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

- d. Renewal Of Licenses.
Licenses issued as a result of an orally-assisted examination may be renewed through an oral-assisted renewal exercise.
6. Obtaining Examinations For Remote Testing.
RECs/MUs may order large quantities of examinations from the Examinations Administration Branch at the National Maritime Center for remote testing. Allow at least four weeks for delivery. Individual modules may be provided via FAX, overnight mail, or E-mail if necessary. Modules for testing individual applicants are normally downloaded and reproduced at the REC as required. Precautions should be observed to prevent compromise once the materials are printed. Upon completion of the exam, the materials should be destroyed.
7. Conduct In The Examination Room.
A sample Examination Room Rules sheet can be found in the Deck and Engine Examination Guides. RECs should provide each applicant with this information and any local rules including the operating hours of the examination room. As part of this information, advise the candidate to read the instruction page included in every module.
8. Testing Materials.
The reference materials required and authorized in the examination room are listed in the Deck Guide and the Engine Guide.
9. Calculators.
Applicants may use calculators but not preprinted forms during the examinations. All calculators must meet the following standards:
 - a. It must not use pre-programmed strips or chips or any other pre-programmed device which may be inserted into the calculator.
 - b. It may not be a permanently-programmed, specialty computer such as a navigation computer. Computers capable of generating trigonometric functions, logs and antilogs, squares, cubes and the roots thereof are acceptable provided they meet all other requirements.
 - c. Any manually programmable calculator without simple erasure capability is not permitted.
10. Time Limits.
Refer to Deck and Engine Guides.
11. Answer Sheets.
Refer to Deck and Engine Deck Guides.

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

12. Examination Questions.

The Examination Administration Branch at the National Maritime Center tries to ensure that all test questions are clear, concise, and understandable. Occasionally errors arise.

a. Module Errors.

RECs/MUs detecting obvious errors in a module should contact the Examinations Administration Branch at the National Maritime Center immediately to resolve the situation.

b. Discussion With Applicants.

Examiners should not discuss the content or quality of a question with a candidate.. If an applicant disputes a question, advise the applicant to select the best possible answer and complete a Comment/Protest Sheet. (A sample Comment/Protest Sheet is shown in the Deck and Engine Exam Guides.) After grading, an applicant often wants to know what questions were marked wrong. Workload permitting, examiners may show applicants incorrectly answered questions. If an applicant disputes the correct answer, advise him/her to complete a Comment/Protest Sheet.. Comments will not be used to change his/her grade; however, if the applicant failed by no more than two questions, a Protest may be filed.

c. Comments.

Applicants' remarks provide valuable input into improving the quality of the questions. Applicants should be encouraged to complete a Comment/Protest Sheet for any question that can be improved. A comment may be submitted at any time in the testing process.

d. Protests.

A comment becomes a protest when all of the following conditions apply:

- (1) The form must be completed before the applicant leaves the examination room;
- (2) The candidate must have a failing grade on the module;
- (3) The comment must be about a question that was answered incorrectly; and
- (4) If credit for a correct answer were given for a question commented upon, it would change the failing grade to a passing grade.

e. Failing Modules By One Or Two Questions.

Any applicant failing a module by not more than two questions can review the module and answer sheet before leaving the exam room area. Applicants may then protest any questions answered incorrectly. Provide the applicant with a copy of the answer sheet for review to prevent alteration of the original.

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

f. Processing Protests And Comments.

The protest(s) and answer sheet(s), CG-5164, should be faxed to the Examinations Administration Branch at the National Maritime Center immediately. Protested questions are reviewed for errors. If the question or answer is wrong, the protest is allowed thus affecting the final grade. A correct answer must be given by the applicant. All work to arrive at mathematical answers must be shown and forwarded for review. A copy of the applicable portions of the chart or plotting sheet should be faxed when plotting accuracy is involved. RECs are notified of the results as soon as possible by fax with telephone follow up whenever possible. If two modules are graded together, then provide both Answer Sheets. Retain comment sheets at the unit until the last working day of the month and then forward them to the Examinations Administration Branch at the National Maritime Center.

13. Practical Examinations.

a. Lifeboatman.

Examination centers with a model lifeboat shall test lifeboatman applicants using the model. Those centers that do not have the model should require applicants to present a letter of certification from a ship's deck officer attesting to their ability to raise and lower a lifeboat and their knowledge of the proper commands and nomenclature for such. The contents of the test are specified in the Deck Guide. A sample letter of certification is included in the Deck Guide.

b. Signaling.

Applicants for ocean or near coastal deck licenses authorizing service on vessels of over 1600 gross tons must pass a practical signaling test. The details of the test are in the Deck Guide. An applicant can complete the signaling portion anytime within one year of passing the written part of the examination. There is no limit to the number of times an applicant may be retested with the flashing light examination. If an applicant continues to fail the signaling exam, he/she may issued a license limited to 1600 gross tons (46 CFR 10.401(h)). However, this limited license option is not available to maritime academy applicants. Replacement tapes for the examination are available from the Examinations Administration Branch at the National Maritime Center.

c. Able Seaman (Knot Tying).

The details of this part of the AB's examination are contained in the Deck Guide. Because of the specialized knowledge required by the examiner to supervise this part of the examination, RECs/MUs may have to contact a local Coast Guard unit for assistance in training the examiners or testing the applicants. Testing at an REC/MU is the preferred method; however, an alternative is for the candidate to provide a letter of certification from a ship's officer, attesting to the applicant's ability to make the required knots, hitches, and splices. A sample letter of certification is included in the Deck Guide.

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

14. Examination Scheduling For Academies.

The graduating classes of state and Federal maritime academies may be examined at any time after the first semester of the senior year.

15. Examination Failures.

a. Completion Of Examination.

Applicants should not be stopped from testing even if they fail three or more modules. This ensures that if there is any change to the examination through the protest process or a correction to the exam is necessary, the applicant will not be penalized.

b. License And MMD Reexamination Policy.

Applicants may be reexamined at any time mutually convenient to the examiner and the applicant. There is no minimum waiting period between the first examination and a reexamination. Applicants failing several portions of an examination or those failing one module with an extremely low score should be encouraged to study before attempting a reexamination. The MAXIMUM number of times a module may be taken by any applicant in an exam cycle is THREE. If an upper level license applicant fails only one or two modules, then the individual may be retested twice on the failed module(s) during the next three months. If three or more modules are failed, then a complete reexamination must be taken. If the applicant only fails one or two modules on the second sitting of the exam, then the individual may retest one more time on the failed module(s). However, if the applicant again fails three or more modules on the second sitting, then the individual must wait for a new exam cycle and retest on all topics. See 46 CFR 10.217(a)(1) for amplifying guidance. The specific reexamination policy for all lower level applicants is in 46 CFR 10.217(a)(2).

16. Examinations For Coast Guard Military And Civilian Personnel.

Coast Guard personnel (military or civilian) employed in an REC/MU may apply for a license or MMD. If the district commander approves the applicant's request, notify the Examination Administration Branch at the National Maritime Center of the desired license or MMD endorsement. To avoid any hint of collusion or impropriety, the Examinations Administration Branch at the National Maritime Center will provide a special examination for testing such applicants. The modules in this examination will be one-time editions similar to the standard modules. The applicant may test at any REC/MU including the one where employed.

17. Requests By Foreign Governments To Examine Individuals.

If a foreign government requests that such a program be established, the Examination Administration Branch will endeavor to accommodate them based on the request and circumstances. Once a program is established, the following procedures are required:

- a. The foreign government must send a letter on behalf of a named individual to the REC certifying that the service and training requirements of the foreign administration have been met.

PART A: MARINER CREDENTIALING**CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS**

- b. When the REC is satisfied with the individual's qualifications, the examination may be scheduled.
- c. Prior to testing, the individual must pay the appropriate user fee.
- d. Individuals successfully completing the examination will receive a U.S. Coast Guard letter attesting to that fact. This letter will not provide Coast Guard certification of competency or authorization to serve in any licensed or unlicensed capacity.

18. Examinations Monitored For Another REC.

Applicants for a pilot's license/endorsement may apply at an REC that does not have testing responsibility for the pilotage area. The applicant should provide all of the required documentation which will be forwarded to the cognizant REC for evaluation. If the cognizant REC does not provide forms with the shore outline, the outlines of the shore area to be used in the chart sketch shall also be forwarded for review. If the application is approved, the cognizant REC shall provide the local knowledge part of the examination, any other specific information necessary for the applicant or the administering REC, and return either the approved outlines of the shore area or supply the Coast Guard provided forms (where applicable) with the shore outline. After the test is administered, the testing REC shall return the answer sheets for the local knowledge questions and the chart sketches to the cognizant REC for grading. Centrally distributed examinations, such as Rules of the Road, should be graded by the testing unit and the cognizant REC advised of the scores. If the applicant passes the exam, the cognizant REC shall advise the testing REC of the specific wording to be endorsed on the license.

B. Custody And Security.

Compromise of an examination module causes the removal of that module from service and requires a replacement. To reduce the probability of compromise, standard security procedures must be followed at each unit. With the advent of RGES, electronic security as well as security for printed materials must be considered. Proper security procedures conscientiously executed by all hands are essential. The following procedures shall be followed by all RECs/MUs:

1. Responsibility.

The OCMI shall designate in writing a custodian to oversee the security of all examination materials. Alternates may also be designated. Before assuming this responsibility, the custodian shall inventory all printed exam modules currently held and review the established information systems security procedures.

2. Stowage.

Stow any printed modules held in a lockable container such as a safe, file cabinet, or desk drawer. Keep all modules in a location where unauthorized personnel cannot take a module surreptitiously. At the close of the workday, account for all modules used. Establish a routine and the responsibility for locking all stowage containers.

PART A: MARINER CREDENTIALING
CHAPTER 5: EXAMINATIONS FOR U.S. MERCHANT MARINERS

3. Receipt of Printed Modules.

Upon receipt of printed modules for special situations such as supplying a TET, inventory the contents of the shipment with the forwarding letter. Report any deficiencies to the Examination Administration Branch at the National Maritime Center. Acknowledge receipt of the modules by signing a copy of the U.S. Postal Service Return Receipt postcard and returning it to the Examinations Administration Branch. If the package is received in a damaged condition or with evidence of tampering, notify the Examination Administration Branch.

4. Examination Log.

Prior to using a module for testing, the examiner shall conduct a page check to verify the module is complete, and that it doesn't have unauthorized marks in it. A log of candidates shall also be maintained. At a minimum, the following information shall be included:

- a. Date of examination;
- b. Candidate's name;
- c. Examination title;
- d. Module number;
- e. Examiner's initials to indicate that the modules were returned intact; and
- f. Candidate's score.

5. Compromises.

A compromise occurs when the possibility exists that a module's contents have been exposed to unauthorized persons. When this occurs, notify the Examinations Administration Branch at the National Maritime Center by phone. Advise the details of the situation and the probability of actual exposure to unauthorized persons. The OCMI shall conduct a local investigation into the circumstances of the case in accordance with the Investigations Manual, COMDTINST M5527.1. Forward a copy of the completed investigation to the Examination Administration Branch.

6. Destruction Of Examination Materials.

Applicants shall turn in all scrap paper, charts, and other working materials used during an examination. Destroy these materials after any pending protests have been resolved. Outdated modules that are replaced shall be discarded and, preferably, recycled.

CHAPTER 6: TRAVELING EXAMINATION TEAMS

A. Background.

When the seventeen Regional Examination Centers (RECs) were established in 1982, the use of Traveling Examination Teams (TETs) was offered as a means to lessen the impact on mariners who live and work in areas remote from the RECs. Subsequent budgetary constraints in the mid-80's caused a substantial reduction in the use of TETs, and a reduction of services provided to marine industry personnel. The Coast Guard Authorization Act of 1986 provided a solution to this problem by authorizing the marine industry to reimburse the Coast Guard for travel and subsistence expenses incurred in administering examinations at remote locations (46 U.S.C. 7504).

B. Mission Performance Standard.

The minimum mission performance standards listed below are established for serving license or document applicants in remote areas. It is recognized that limited personnel resources and scheduling considerations may prevent the fulfillment of these standards.

1. Number Of Trips.

A TET is appropriate whenever a group of at least 20 applicants in one remote area has been determined to be fully qualified for examination. If there are enough qualified applicants, one TET trip will be made monthly to each remote area. Applicants must be determined to be qualified sufficiently before the scheduled trip to allow for the routine administration of the program (normally 7 to 10 days).

2. Testing Of Non-Students.

TET sponsors must provide non-students access to the examination. The sponsor will be permitted to pass on a reasonable portion of exam specific expenses to these examinees.

3. Dual Purpose Travel.

The TET funding mechanism is currently the only available option due to statutory authority, Coast Guard budgetary restrictions, and a desire to treat all mariners equitably. One result of requiring reimbursement is that individuals from remote areas are discouraged from seeking the required licenses. RECs should use any innovative means to reduce the need for reimbursable expenditures such as dual purpose travel. EXAMPLE: Administer examinations during a vessel inspection trip.

4. Remote Area.

A remote area is one that is more than 150 miles from the nearest REC or the site of another TET visit. OCMI discretion allows for TETs to be dispatched to locations within the 150 mile radius dependent upon personnel resources at the REC.

5. Use Of Coast Guard Auxiliary Personnel.

To augment existing REC personnel, members of the Coast Guard Auxiliary are authorized to examine applicants at the discretion of the local OCMI.

PART A: MARINER CREDENTIALING
CHAPTER 6: TRAVELING EXAMINATION TEAMS

6. Discretion Of The OCMI.

Additional TET trips (including foreign TET trips) may be scheduled at the discretion of the Officer in Charge, Marine Inspection (OCMI).

C. Reimbursement.

Except for trips made to the schools receiving federal aid under 46 CFR Part 310 for the examination of students as required by 46 CFR 310.3(b)(2), or those examined at the U.S. Merchant Marine Academy, all TET trips will be conducted on a reimbursable basis.

D. Administration.

The following procedures will apply to all TET trips, except as provided for in paragraph 6.C.

1. Travel Order Number (TONO).

When a TET trip is warranted, RECs shall forward a request for a TONO(s) and accounting data to NMC-4C. This request should be made by E-Mail or telefax. If the TET trip is approved, a TONO(s) will be issued by NMC-4C.

2. Letter Of Undertaking (LOU).

A single billing source must be provided for each group of applicants. This source may be an individual, organization, or company who agrees to reimburse the Coast Guard. This individual, organization, or company shall submit a LOU that must be received by the REC before the commencement of any travel. The LOU shall contain the following information (a sample response to requests for TET services and a sample LOU are shown in Figures 6-1 and 6-2):

- a. An agreement to reimburse the Coast Guard for all travel and per diem costs incurred in providing the TET services;
- b. The name and address of the individual, company, or organization to be billed; and
- c. An agreement to provide adequate testing facilities for the applicants to be tested. This may be waived if the OCMI will provide the space.

3. Travel Log.

A travel log shall be maintained for each TET trip. If two or more groups are tested on the same trip, the completed log must reflect how the total chargeable expenses should be prorated among the groups (See Figure 6-3). Travel logs should be retained at the REC.

4. Billing.

To facilitate billing for the TET trip, the following material shall be submitted to NMC-4C upon completion of the trip:

- a. Letter(s) of undertaking;
- b. Copy of travel orders (CG-4251);
- c. Copy of travel voucher or subvoucher (DD 1351-2); and

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING
CHAPTER 6: TRAVELING EXAMINATION TEAMS

- d. Copy of travel summary of expenses from HRSIC
- E. Acceptance of In-Kind Travel and Travel-Related Expenses.
The acceptance of company or applicant supplied meals, transportation, or lodging is prohibited, unless no other arrangements (e.g., for reimbursement in accordance with 46 U.S.C. 7504 and the procedures set forth in paragraph 6.D. of this Volume) can be made; and the acceptance of such expenses complies with the requirements of the Standards of Ethical Conduct for Employees of the Executive Branch, 5 CFR 2635. If it is necessary to accept in-kind and travel-related expenses, prior approval shall be obtained from NMC-4C. Remember that the examination procedure is the only means available to the Coast Guard for determining an applicant's professional competence. Thus, the same vigilance used in the REC examination room must be maintained in external relationships with those requesting TET assistance

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 6: TRAVELING EXAMINATION TEAMS

FIGURE 6-1: SAMPLE RESPONSE TO TET REQUEST

16721

Dear Sir:

Title 46 United States Code 7504 authorizes the reimbursement of Coast Guard expenses incurred in conducting licensing and/or seaman documentation services at a location other than at the Regional Examination Center. That reimbursement is limited to travel and subsistence expenses.

Accordingly, before the service you have requested in your (letter) (telephone call) of _____ can be scheduled, this office must be assured that the Coast Guard will be reimbursed for the expenses incurred. This assurance may be provided by completing and signing the enclosed Letter of Undertaking and returning it to this office. The letter also certifies that you will provide adequate testing facilities for the requested service.

The following conditions must normally be met before a TET will be authorized:

1. There are at least 20 applicants whose applications have been evaluated and found to be qualified.
2. A TET trip will normally be provided only for locations in excess of 150 miles from this office or another TET site.
3. The completed application and supporting documents for each individual must be received by this office at least ten working days prior to the anticipated testing date.
4. Only individuals with previously approved applications will be examined.

Sincerely,

Encl: (1) Letter of Undertaking

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

A. Background.

The Coast Guard's policy with respect to maritime training is changing as a result of several influences. These include the development of new technology, obligations resulting from the implementation of the Standards of Training, Certification and Watchkeeping (STCW), and the economic realities faced by both the Coast Guard and the maritime industry. Labor saving technological advances have resulted in smaller crews and the elimination of traditional apprentice/training billets. STCW requires mariners to demonstrate practical proficiency, as well as knowledge, prior to the issuance of documents and licenses. The Coast Guard is required to meet its responsibilities regarding marine safety and environmental protection with fewer resources each year. The maritime industry needs to operate its vessels in the most cost effective manner possible while also meeting its obligation to employ well trained, competent mariners using clearly defined and understood procedures to safely operate the vessels. Well designed training programs, including the integration of simulators, can provide the mariner with a quality training experience.

B. Requirements.

The Coast Guard will consider granting approval of a course or training program for one of the following reasons:

1. The course is required by regulation.
2. The course substitutes for part of the sea service required for issuance of licenses and certificates.
3. The satisfactory completion of a course is substituted for a required examination.

C. Course Approval Application Procedures.

1. The course approval process is explained in Title 46 of the Code of Federal Regulations, Part 10, Subpart C (46 CFR 10.301 - 10.304). An organization desiring to have a course approved by the Coast Guard must submit a Course Curriculum Package to the Commanding Officer, National Maritime Center (NMC-4B) at 4200 Wilson Blvd.; Suite 510; Arlington, VA 22203-1804.
2. Course approval submissions must document that the course covers the material necessary to satisfy regulatory training requirements. Specific course guidelines produced and used by the Coast Guard for the review of approved courses are discussed below and may be obtained through the Internet via the Marine Safety Web site at www.uscg.mil/hq/g-m/gmhome.htm or by writing the Commanding Officer, National Maritime Center (NMC-4B). The course curriculum package should consist of the following:

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

a. Cover letter.

The cover letter consists of:

- (1) the identity of the school;
- (2) the name of the course;
- (3) the length of the course;
- (4) what regulatory/STCW requirements will be satisfied;
- (5) what examination requirement the course will substitute for;
- (6) the sea service requested;
- (7) the location of the training facility; and
- (8) whether the course will be offered at satellite locations.

b. **Course framework.** This section provides an overview of the main components of the course and establishes the purpose of the course. The framework consists of:

- (1) Scope.
A brief description of the regulatory, sea service, or examination requirement the course seeks to satisfy. Where sea service credit is the objective of the course, justification must be provided for the sea service credit requested.
- (2) Objective.
A statement discussing the goal(s) and overall learning objective(s) of the course.
- (3) Entry standards. A list of the prerequisites a student must have to attend the course, such as minimum amount of sea service, mariner's document or license, etc.
- (4) Class limitations.
 - (a) Class size. State the maximum number of students to be admitted for classroom lessons and, if appropriate, for practical demonstrations or simulation program lessons, along with the number of the students per simulator.
 - (b) Student/teacher ratio. State the student/teacher ratio and discuss the organization's policy for circumstances when more than one instructor will be present during any of the lessons.
 - (c) Instructors. Provide a resume for each instructor designated to teach the course that includes a description of his or her experience, background and qualifications. NVIC-5-97 and NMC Policy Letter 6-98 provide guidance on instructor qualifications. The instructor must hold a valid Coast Guard license, MMD, or other professional certificate appropriate to the maritime subject(s) being taught, or have unique qualifications specific to non-maritime subject(s) being taught, such as welding, first aid, or CPR.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

(5) Teaching facilities and Equipment.

(a) Facility.

This should include the address and a description of the facility at which the training will be held. This includes a detailed training facility site plan, labeled, and to scale, showing the arrangement of student's desks, instructor's area, training aid placement, aisles, doors and fire exits.

(b) Course equipment.

A description of the equipment that will be used during the course. This is to include all equipment used during hands-on training and/or testing, and any simulators or simulation programs. If a simulator or simulation program is used, technical and performance specifications must be included. For courses satisfying STCW training requirements, any simulator required to be used must meet the applicable performance standards.

(c) Teaching aids.

(d) Visual aids.

A discussion of how audiovisual and other aids will be used during the training course, and which performance objectives they will impact should be included in the lesson plans.

(e) Textbooks.

Include copies of all student handouts, homework assignments and/or workbooks, and a bibliography of the student textbooks to be used.

Note: If the NMC does not have the textbooks available, copies may be required for review. Texts will be returned after the course has been evaluated.

c. Instructor's Manual.

The instructor's manual provides specific guidance on teaching strategies and techniques used during the course of instruction. Include a copy of the instructor's manual when requesting an original course approval. The manual should address the course presentation strategies and is to include the following:

(1) Course Outline.

The course outline will be given to each student. This outline should indicate the subject areas, topics and sub-topics comprising the body of the course

(2) Course Schedule.

The course schedule includes the length of each lesson and indicates whether the lesson is a classroom lecture, practical demonstration, simulator exercise, other lab exercise or examination. The subject matter headings should correspond to the subject areas listed in both the *Course Outline* and the *Learning Objective Syllabus*.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

(3) Learning Objective Syllabus.

The Learning Objectives Syllabus should be written in the IMO Model Course learning objectives format. References should be made to the learning objectives indicating which publications and teaching aids the instructor will use when preparing and presenting the course material. The syllabus is to include the total length of each subject area in hours.

(4) Lesson Plans.

Lesson plans should be provided for each subject or class session. An exception will be permitted for training organizations recognized by an accrediting or training organization whose courses are approved by a USCG accepted QSS organization.

Samples of a course outline, a course schedule, and a learning objective syllabus may be obtained through the Internet via www.uscg.mil/hq/g-m/gmhome.htm or by writing the Commanding Officer, National Maritime Center (NMC-4B).

(5) Examination and Assessment.

Include an explanation detailing the methods of evaluating students' performance throughout the course. Include the following as applicable:

(a) Written examinations.

Schools should submit copies of all written examinations (multiple choice, subjective essay, or combination) and the grading procedure to be used. The frequency of revision of exams, a description of the methods of selecting multiple choice questions for each examination to be administered, and the passing score for the examination should also be submitted.

NOTE: "Simple" multiple choice format questions about the computational process can not be accepted where computational problems are necessary for determining the student's acquisition of knowledge, such as navigation problems. However, a computational problem in which the student must work through the solution and select from multiple answer choices is acceptable, e.g. questions comparable to those used for Navigation Problems on Coast Guard license exams.

(b) Practical demonstrations.

Detailed descriptions of all practical and/or simulator demonstrations, tests, and practical exercises that describe the exercises to be presented to the student. This should include copies of the evaluation process standards for each exercise, separate checklist(s) used to evaluate and record each practical demonstration, the evaluation process to determine competency, and the process by which each student's performance will be evaluated.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

(c) Determination of final grade.

A discussion of how the final grade will be determined, including proportioning written examination scores and practical demonstration output performance as appropriate.

NOTE: Homework and other out-of-class assignments will not be considered as acceptable portions of the student's final grade.

(d) Re-test procedures.

A description of the school's policy on re-tests of failed examinations and other assessment methods and the method of providing an unsatisfactory course completion.

(e) Course Critique.

Submit a student course critique. A student course critique provides one method by which students are given the opportunity to provide feedback to the training organization on the suitability of the course, the instructor's overall performance, suitability of training aids, etc. All forms providing the student the opportunity to submit evaluation to the training organization are to be included with the approval request. Completed student course critiques should be maintained with all other records

D. Training and Granting Sea Service Substitution Criteria.

Courses that are found satisfactory in all respects, e.g., meet or exceed U.S. Coast Guard and/or IMO standards, may be evaluated by the National Maritime Center staff, upon request, to determine and grant a reasonable equivalent amount of sea service credit for the successful completion of the training. The factors considered when determining the granting of sea service credit for approved training are provided below: Sea Service equivalency can not be used to reduce sea service below that required by STCW or 46 CFR Part 10.

1. Course Characteristics

The NMC will consider the characteristics of the course and the type of training being conducted. Generally, sea service may be credited on the following basis:

Classroom lecture	2:1
Part Task Simulators	4:1
Full Mission Simulator	6:1

When training involves a combination of the above, sea service is to be awarded on a pro rata basis proportionate to the amount of time devoted to each type of training (7 hours = 1 day). For example, a course involving 14 hours of classroom lecture and 14 hours of full mission simulator exercises would receive 16 days sea service credit (2 days classroom at 2:1 and 2 days full mission simulator at 6:1). The above guidelines should be applied to new courses and to existing courses at the time the course is renewed. "Specialized" sea service may be awarded, as appropriate, on the basis of 2 days credit for 1 day of training (7 hours). The amount of sea service awarded shall not exceed 10% of the required

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

service. For example, up to 9 days tank vessel service may be awarded for a dangerous liquids course (90 days service required for endorsement).

2. Consistency with Other Courses.

Once the sea service credit has been determined the scope of training provided, the course is to be compared with similar courses which have already been approved to ensure consistency of standards.

3. Underway Training.

The accrued sea service, as a result of participation in MARAD approved schoolship programs or training cruises, is credited at 1.5:1, or "time and one-half." MARAD is the approval authority for maritime academy programs and uses this ratio, based upon a 12-hour, standard day, in addition to the fact that the program consists of a structured program of on board instruction. Sea service credit is granted for individuals/students completing cruises aboard commercial vessels and is provided at a 1:1 ratio, or day for day.

4. Constraints on Sea Service Credit.

Credit granted for training time must be in compliance with the STCW 1978 as amended; or 46 CFR Part 10, Subpart C; or Section 7315 of Title 46 U.S. Code (46 U.S.C. 7315).

- a. STCW suggests that a maximum of two-thirds of the required service for a deck officer in charge of a navigational watch can be substituted by school time. For example, if one sea-year of experience (360 days) is required of a deck license applicant, 240 days of the at-sea experience may be substituted by training. The remainder of the experience (120 days) must be obtained at sea.
- b. Satisfactory completion of approved training courses may substitute for up to two-thirds of the required service on deck or in the engine department respectively for deck or engineer licenses. Satisfactory completion of approved training courses may substitute for up to one-third of the required service for a qualified deck rating, or up to one-half of the required service for qualified ratings in the engine department, or as provided by 46 CFR 10.304(a).
- c. Sea service credit from approved training course or on a training simulator is not accepted to satisfy recency requirements. However, underway time at an approved course may be used for this purpose. An applicant who met the recency requirement prior to entering a school program shall not be penalized by attendance at an approved training course.
- d. Training received prior to obtaining a license may not be used for any subsequent raise in grade.
- e. Paragraph (d) of 46 CFR 10.304 limits the amount of credit granted for the completion of a course featuring simulator training. A maximum of 25 percent of the required service for any license transaction may be substituted for graduates of such courses.

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

- f. 46 U.S.C. 7315(b) and (c) restricts substitution of school time to one-third of the required service for an able seaman (AB), and one-half for a qualified member of the engine department (QMED) rating. When reviewing license, certificate, or document applications, evaluators shall ensure that creditable service granted to qualified graduates of approved courses is not counted twice.

5. Repeating Approved Courses.

Approved courses may be repeated for credit under certain circumstances, such as completing shiphandling training or a diesel course at different license levels, unless expressly prohibited under the provisions of the approval.

E. Instructor Qualifications.

The training organization must include a list of the experience, knowledge and skills the course instructors are to possess to effectively teach the course. When recommending a person for approval as a qualified instructor, the training facility must establish that the person has the necessary instructional experience or instructional technique training acquired, maritime related knowledge and skills, and otherwise explain why the person is qualified. When reviewing an instructor's credentials several factors are considered:

1. Experience.

The individual should have a valid Coast Guard license, document, or certificate appropriate to the content of the course. If the person does not hold a valid license, evidence must be presented that demonstrates an equivalent level of maritime (industry/field) experience, knowledge, and skill. For example, an instructor for an unlimited radar observer course should have at least a license as master of near coastal steam or motor vessels of not more than 500 gross tons with an unlimited radar observer endorsement, or other equivalent watchkeeping experience appropriate to the course.

2. Skills.

An instructor must have a high level of understanding of the knowledge and skills taught in the course, in addition to having experience in their practical application. A license does not always serve as proof that the individual has experience with or a thorough understanding of all topics covered by the license examination. On the other hand, a person without a license may have the appropriate experience, knowledge, and skills necessary to teach a specific course. In either case, the following items presented in NVIC 6-97, "Policy on Qualified Instructors and Designated Examiners Who Train or Assess The Competence of Merchant Mariners" must be verified:

a. Instructor Credentials.

A background or experience in teaching or training in instructional techniques.

b. Subject Knowledge.

A high level of understanding of the particular subject area.

c. Instructor Skills.

The ability to use appropriate training techniques to accomplish the objectives of the training

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

3. Teaching Ability.

A prospective instructor should have experience in teaching or training and/or knowledge of instructional techniques. An instructor must be able to communicate his/her experience, knowledge, and skills to the students. A highly knowledgeable person will not add to the course if he or she is unable to communicate that knowledge.

Training institutions should consult NMC Policy Letter 6-98 and NVIC 6-97 for further guidance on instructor qualifications.

F. Training Site Requirements.

The Coast Guard considers a suitable training facility an important component in providing quality training. 46 CFR, 10.303 requires: "**Each school with an approved course must: (a) Have a well maintained facility that accommodates the students in a safe and comfortable environment conducive to learning.**" The following guidelines are provided as a means to establish a suitable, shore-based, training room in which the student is provided an atmosphere conducive to learning. These guidelines are recommendations. However, where a training facility does not meet site acceptance guidelines, the training organization must present substantiating documentation supporting their contention that the site is suitable for the training offered.

1. General Considerations.

OCMIs should consider the following as the minimum standards for all approved course training facilities including local alternate (satellite) training facilities. To assist in the determination of suitability of all training facilities, obtain as a minimum, the following information before an approval is provided:

a. Site Plan.

A scaled site plan must be provided for each training facility location request. If classes are to be held in a local alternate training facility, the site plan when necessary, should be accompanied by marketing brochures or other reliable information, such as signed copies of contracts, to support the information set forth in the scaled site plan.

b. Class Size.

The maximum number of students permitted to occupy a classroom at a training facility, or alternative location, will be limited to the number permitted by the original course approval. Class size may be further limited by the physical size of the primary (original) or local alternate training facility (classroom) by the application of the following student/room size ratio:

An area of 72 ft² must be allowed for the instructor, and an area of 36ft² per student must be provided as a suitable minimum. To calculate the maximum number of students permitted in the training room, subtract 72 ft² from the total square footage of the room, and then divide the remainder by 36 ft².

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

EXAMPLE: A request is made to conduct training in a local hotel conference room:

[1] site plan area equals:	900 ft ²
[2] deduct (instructor's area)	- 72 ft ²
[3] usable student area	<u>828 ft²</u>

Dividing the student area of 828ft² by 36ft²/student results in 23 students as the maximum number permitted.

c. Class Room Practical Work.

For courses requiring practical work, such as chart exercises, each student must have sufficient table space to use the chart without folding it or interfering with and overlapping another student's chart. An acceptable chart table should measure approximately six (6) feet long by 2.5 feet at a minimum (folding tables are acceptable). The distribution of tables and chairs should include aisle space. The widths of the aisles between rows of desks should be no less than 2.5 feet and perimeter aisles should be no less than 2.5 feet unless superseded by local codes.

G. Review of Course Curriculum Packages.

1. Site Review.

The OCMI in whose zone the training is to be conducted, by direction of the National Maritime Center (NMC), will conduct the initial review of the request for course approval. A visit will be made to the training site to evaluate and assess the facilities utilized in the conduct of a course by each school. The evaluation will include, but is not be restricted to:

- a. The suitability of the facility and classroom environment,
- b. The inspection and testing of simulators, simulation programs, equipment to be used in practical demonstrations, vessels to be used for training, or any other associated training equipment;
- c. *The NMC will determine whether simulators meet training and applicable performance requirements.*
- d. The review of visual aids;
- e. The interview of instructors;
- f. The discussion of course administration; and
- g. Other issues related to the approval of the course.

2. Course Element Review.

The National Maritime Center will evaluate courses submitted for approval as follows:

- a. Whether it can be reasonably be assumed that a student who successfully completes the course would, on the first attempt, pass a comparable exam prepared by the Coast Guard. *See 46 CFR 10.303(c)*
- b. Review of the approval request regarding the objective(s) of the course.
- c. Review and verification of the qualifications of the instructor(s).

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

- d. Student proficiency objectives.
 - e. Suitability of the examinations and assessments.
 - f. Lecture and examination topics cover learning objectives and otherwise satisfy U.S. Coast Guard and/or International Maritime Organization (IMO) requirements.
 - g. Review of the description of the facility and training equipment (including simulators) and its relationship to the presentation of the course.
 - h. Comparison with other similar courses that have already been approved.
3. Unsatisfactory site reviews will be brought to the attention of the applicant and followed up by a letter stating the nature of the deficiency.
 4. Course submissions and recommendations that may impact Maritime Administration (MARAD) programs may be submitted to the Office of Maritime Labor and Training for review and comment.
- H. Conduct Of Schools with Approved Courses.
Any training facility with a Coast Guard approved course must operate within the requirements of 46 CFR 10.303:
1. For at least one year after the end of each student's enrollment, the school must maintain the students' completed examinations on file, a report of practical tests administered, and a record of their classroom attendance; and
 2. Allow at any time, the OCMI or a designated representative, to:
 - a. Inspect the facilities, equipment, and records (e.g. attendance, test scores);
 - b. Conduct interviews and surveys of students to supplement the students' evaluation of the course;
 - c. Assign personnel to observe or participate in the course of instruction (with or without prior notification); and
 - d. Supervise or administer the required examinations or practical demonstrations.
 3. If a particular course site approval allows the course to be taught in various locations (e.g., conference rooms at national hotel chains) and it is to be offered to provide training to merchant mariners for the purpose of meeting licensing requirements, the course offeror must also provide to the designated representative:
 - a. Advance notice of at least 15 days must be submitted to the OCMI within the zone of responsibility where the training will be conducted. The designated representative may, at his or her option, visit the training facility to determine that the training is being conducted in a suitable manner and in accordance with the Coast Guard approval;
 - b. A class schedule indicating the course, date, location, and the instructor(s) of the training being offered;

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

- c. The address and telephone number(s) of the central location where student records are kept and where the validity of an individual student and/or instructor's certificate may be verified; and
 - d. A list of students scheduled to attend the course. Where applicable, students repeating the course are to be indicated.
- I. Changes To Approved Courses.
- 1. Curriculum Change.
Any proposed change to an approved curriculum, including a change of simulators or training aids, must be submitted to the National Maritime Center for evaluation and written approval. A course may not be altered due to the failure of equipment necessary for the presentation or operation of the course. A training organization has the responsibility to suspend the conduct of the course if the required equipment is not operational.
 - 2. New Training Site.
Review for acceptance of a training facility, other than the one for which it was originally approved, is to be done by the OCMI in whose zone the new training facility is located. The OCMI should ensure that only the approved curriculum will be used and that the course will only be taught by qualified instructors. An on-site inspection must be made to ensure the site will be suitable to the needs of the course and the students. If the new facility is found acceptable, the OCMI will notify the National Maritime Center of its acceptance by providing a copy of the acceptance letter. Any special conditions for convening the course at the new site should be noted in the letter. If a training facility is relocating an approved course to a site which is in the area of responsibility other than that of the original OCMI, the process of acceptance is essentially the same. If the new site is acceptable, the OCMI will notify the school, the National Maritime Center, and, if necessary, identify any special requirements for conducting the course at the new site.
 - 3. Acceptance of New or Additional Instructor.
After the initial/original approval, but prior to the individual conducting the approved course, the acceptance of an additional or replacement instructor must be submitted by the applicant to the NMC for evaluation and written approval.
- J. Period of Approval.
Initial approvals are effective for a period of two years, unless sooner suspended, withdrawn or surrendered. Subsequent renewal periods may be granted for five-years, unless sooner suspended, withdrawn or surrendered.
- K. Retroactive Approval.
In some cases, schools submitting an original course approval have requested that the approval be backdated. Generally, an original approval is only granted back to the date of the letter requesting that the course be considered for approval and sea service credit.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

L. Approval Renewal Requests.

Requests for the renewal of an approved course should be submitted to the Commanding Officer, National Maritime Center (NMC-4B) at 4200 Wilson Blvd.; Suite 510; Arlington, VA 22203-1804 at least 90 days before the current approval expires. Courses that are submitted for renewal will be reviewed based on current guidelines and are to include a copy of the course outline and schedule. The letter requesting renewal should include:

1. Modifications that were made to the course;
2. What facility and/or equipment changes have occurred;
3. The number of times the course has been presented during the 12 month period immediately prior to the date of the renewal request.

NOTE: Courses that have received approval and have not been conducted during the period of approval are to be resubmitted as an initial approval request. The new approval will not exceed the initial two year period.

When a school with an existing approved course submits the letter requesting renewal, the OCMI should visit the school as directed by the National Maritime Center as part of the evaluation process and note their findings in the forwarding letter. When a course is submitted for renewal, the date of approval will generally run consecutively with the last date of expiration. If an approval expires during the approval process as a result of administrative handling, the renewal will be backdated to maintain continuity with the last expiration date. If, however, an approved course is not submitted for renewal on or before its expiration, the Course Curriculum Package will have to be re-submitted and processed as an original course approval.

M. Third Party Training Organizations.

Training organizations offering approved courses should have course approval in their own name. A training organization wishing to conduct training by the adoption of a previously approved course acquired from another training organization must submit their request to conduct the training to the NMC. The training organization is to submit the course curriculum package in the same manner as if the course were an original course approval request.

N. Approval of Foreign Training Courses.

The Coast Guard will not approve any course taught outside the territory of the United States, either by schools or institutions incorporated in a foreign country or by U.S. owned/operated schools or institutions. However, training courses offered in schools whose states are on the "white list" maintained by the IMO, will be accepted to satisfy STCW training requirements provided training does not lead to certification or licensing. A U.S. owned or operated training institution desiring to offer training outside the United States, must obtain the approval of that country's administration.

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

O. Approved Course Oversight.

Effective oversight is considered essential to the approved course program. OCMI's are encouraged to establish a schedule of oversight visits to courses within their zone. The National Maritime Center may be consulted as to the frequency and detail of course audits. Regulations and policy guidance are in development establishing formal oversight procedures.

OCMI's are to ensure that course oversight can be conducted on each alternative site. For the oversight program to succeed in improving the overall quality of instruction, schools with approved courses must understand that the Coast Guard can inspect their course at any time. Until an OCMI has developed a comprehensive plan and schedule to account for the total number of courses and the available resources to conduct oversight of all courses, in addition to proposed local alternate training facility, OCMI's should not authorize the conduct of an approved course at an alternate site within their jurisdiction. In developing the inclusive plan, priority one courses are to be audited on at least an annual basis. Approved courses presented in lieu of Coast Guard examinations are to be audited within six months of the initial "interim" approval.

1. Administrative Actions.

The following administrative actions may be taken by the designated representative after consultation with the National Maritime Center;

a. Administrative Censure.

Administrative censures are warnings issued for lesser discrepancies, to include, but not be limited to a training organization as a result of incomplete student evaluation forms, student files occasionally missing information, the inability of the training organization to produce required administrative files within a reasonable period of time, continual reuse of written examinations, inappropriate advertising of courses, etc. Discrepancies of this type are to be discussed with the training organization, followed by a written report summarizing the noted problems and setting a reasonable time period in which to cure the deficiencies, not to exceed 30 days. Administrative censure may also be used for actions involving an instructor's teaching technique. Regardless of the extent of training, instructional techniques extend beyond methodology. Any consideration by an auditor must, therefore, include the opinions of the students attending the course. Where student interviews and/or critiques substantiate an auditor's appraisal of an instructor's ineffectiveness, the training organization and the instructor are to be provided the opportunity to modify the individual's instructional technique and to be re-evaluated the next course presentation. A training organization cited with three administrative censures within a three year period or three administrative censures in one visit, may have all affected courses suspended for not less than 30 days. Administrative censures recorded by each OCMI or designated representative will be entered into a database, established and maintained by NMC, to track discrepancies and actions taken.

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

b. Suspension Of Approval.

The Commanding Officer, National Maritime Center or its designated representative have the authority to suspend approval for a course. Approvals may be suspended if the NMC, or its designated representative determine that the course does not comply with applicable portions of the Code of Federal Regulations, or has not maintained the requirements specified by the course approval, or if there are substantial deviations from the course curriculum package as submitted for approval, or if the course is being presented in a manner that is unsatisfactory, or that the course is not conducive to achieving the submitted learning objectives, or that a training organization has received multiple and/or frequent administrative censures. The NMC, or its designated representative, may suspend the course approval, require the surrender of the certificate of approval and/or direct the approval holder to cease claiming the course is Coast Guard approved. Upon suspension, the NMC is to verify that the approval holder has been notified how the course failed to meet applicable requirements and explain how deficiencies may be corrected. The NMC may suspend the approval for up to 60 days to cure the deficiencies cited. If the training organization considers the suspension to be unwarranted, they may appeal the decision to the respective Coast Guard District Commander. If the training organization elects, they may reapply for a new approval of the suspended course prior to the end of suspension, emphasizing their new operating standards, through the National Maritime Center. This request shall be treated as an original approval request.

c. Withdrawal Of Approval.

Withdrawal of an approved course can be applied, but not limited to the following: if found in violation of the regulations pertaining to the conduct of an approved course, or if the school ceases operation, or ceases to offer the course, or if there has been a determination that the approval holder has demonstrated a pattern or history of failing to comply with applicable regulations or the requirements of course approval, or substantially deviates from the approved course curricula, or presents the courses in a manner that is unsatisfactory or not conducive to achieving the specified learning objectives, or actions by instructors or training organization staff members contributing to the falsification of student documents or inappropriate issuance of a course completion certificate, or unauthorized modification of a course without having filed a request or provided appropriate notification, or prompting the students to give correct answers during an examination, or the coaching of students to correctly perform a demonstration during a performance-based assessment. A school will be notified by the NMC in writing by return receipt mail of the circumstances and pending action. At any time after the approval of a course has been withdrawn, the school may initiate another request for approval of the subject course(s). Any such request will be treated as an original course approval request.

PART A: MARINER CREDENTIALING
CHAPTER 7: MARITIME TRAINING COURSE APPROVAL

d. Supplemental Processes.

The Coast Guard recognizes that quality work produced by a training organization is worthy of being disseminated throughout the arena of maritime training. Therefore, it must be recognized that the quality of an approved course extends beyond the approval of a course package. Just as a manufacturer is required to guarantee a product to the consumer, the originator of an approved course has the responsibility to verify that their course can be effectively delivered at a satellite location. Verification by the course originator must be completed prior to the request for a satellite location of a previously approved course. A letter of verification from the approved training course originator must be forwarded when requesting approval of a satellite location. To emphasize the responsibility of the course originator, the suspension or withdrawal of an approved course at an accepted satellite location may result in an administrative censure for each occurrence to the originator's training organization. Training organizations offering a Coast Guard approved course should provide written affirmation to the mariner that the course approval is still valid at the time the course is offered to the student. The affirmation should also set forth the credit offered, based upon course completion. Courses which have had approval withdrawn must be resubmitted for evaluation to consider reinstatement of the affected course(s). The withdrawal of a course approval is indicative of a managerial system that is totally unacceptable. The new submission must include a detailed account of the training organization's adoption and implementation of a quality management system (QMS). In particular, the QMS must provide a strategic plan as part of this process which will address how the events which lead to the course approval being withdrawn will be prevented from recurring. Additional guidance is available through NVIC 7-97, *Guidance on STCW Quality Standards System (QSS) for Merchant Mariner Courses or Training Programs*.

PART A: MARINER CREDENTIALING
CHAPTER 8: RECORD MANAGEMENT FOR U.S. MERCHANT MARINERS

A. Records Management.

This section provides guidance on the maintenance of license, certificate of registry, STCW certificates and document files by Regional Examination Centers (RECs). Additional guidance can be found in COMDTINST M5212.12, Paperwork Management Manual.

1. Merchant Mariner's Document (MMD)/Sea Service Files.

Seamen documentation files are held at the REC for a period of one year from the date of the last transaction and then destroyed. All original applications shall be forwarded to Commanding Officer, National Maritime Center (NMC-4A) at the time the document is issued. When license and MMD transactions are completed at the same time, on the same application, the original application should be retained in the license file at the Regional Examination Center (REC) and a copy sent NMC-4A with a note that the original application is at the REC.

2. License And Certificate Records.

Files should be sent to the Federal Records Center (FRC) seven years after the last transaction, e.g., license renewal, upgrade, and should first be sanitized by removing examination answer sheets and other extraneous material. The following are examples of file contents that should be forwarded to the FRC:

- a. Applications and all supporting documents;
- b. Letters of service;
- c. Records of examinations; and
- d. Canceled license(s) and STCW certificates, if the mariner does not want them.
Return the canceled license(s) and STCW certificates to the mariner when possible.

3. Security Of Coast Guard Forms.

Each REC shall maintain a record of licenses and Certificates of Registry forms, Certificates of Discharge (Form CG-718A), and all other controlled forms. Each REC shall maintain a log indicating who received the forms at the REC, the individual who received the forms for use, the date distributed for use, and signature of the recipient. Before signing the receipt, the custodian shall carefully check the control numbers of the documents being delivered to determine that none are missing. The bulk supply on hand should be securely packaged, kept in a safe or locked cabinet at all times, and periodically reviewed. The available supply for day-to-day use shall be checked daily against the control record. If at any time blank license/Certificate of Registry forms, Certificates of Discharge, or other controlled forms are discovered missing a unit investigation shall begin immediately. A complete report of the circumstances shall be made promptly following the investigation to Commanding Officer, National Maritime Center (NMC-4A), via the district commander. A complete audit of all blank forms should be completed:

PART A: MARINER CREDENTIALING**CHAPTER 8: RECORD MANAGEMENT FOR U.S. MERCHANT MARINERS**

- a. Semiannually;
 - b. When staff members with access to the forms change; and
 - c. At any other time the OCMI deems it necessary.
4. License Stubs.
These records are to be maintained at the REC for a period of seven years, then destroyed at the REC.
 5. Exam Room Logs.
These logs should be retained one year then destroyed at the REC.
 6. Transferring Seaman's Files Between RECs.
Files shall be forwarded by rapidraft letter requesting a receipt signature. The rapidraft should indicate who requested the file be transferred *and* how the request was made, e.g., phone, E-mail, letter. The file should be sent certified mail, return receipt requested. The originating REC will place the rapidraft and the signed return receipt in the now empty mariner's file folder. The contents of mariners' files may be transferred on a telephone request from the applicant or another REC.
 7. Freedom Of Information Act Requests (FOIA).
When determining what information is releasable from a mariner's file under the Freedom of Information Act (FOIA), use the FOIA Manual, COMDTINST M5260.2, the FOIA officer, and the district legal staff. Be conservative in your determination, as additional items may be released under appeal; however, the file's custodian may be held personally accountable for violations of the mariner's privacy. Note that FOIA denials can only be made by designated officials, normally the district commander.
 - a. Non-Releasable Information.
 - (1) The following information must be withheld under exemption (b)(3) in 5 U.S.C. 552 because it is required by other statutes to be protected:
 - (a) The fact that the mariner holds an MMD; and
 - (b) All information contained on the Merchant Mariner's Document, Merchant Mariner's Document application or in the MMD record (manual or electronic). forward all requests for information in MMD records to Commanding Officer, National Maritime Center (NMC-4A).
 - (2) The following information must be withheld under exemption (b)(6) in 5 U.S.C. 552 as a clearly unwarranted invasion of personal privacy:
 - (a) Information regarding the arrest and conviction record, including Section IV, Narcotics Record of the License/MMD application, Form CG-719B and answers to the questions in blocks 20 and 21 of the old license application, Form CG-866;
 - (b) Exam scores and employment records, including lists of discharges and letters of service as well as employment history listed on the application; and
 - (c) Present address and home phone number.

PART A: MARINER CREDENTIALING**CHAPTER 8: RECORD MANAGEMENT FOR U.S. MERCHANT MARINERS**b. Releasable Information.

- (1) Type and grade of license and certificate of registry, including endorsements.
- (2) Issue number.
- (3) Date and port of issue.

c. FOIA Requests.

Requests must be in writing, even if the only information desired is that which is on the face of the license.

8. Shipping Articles.

Shipping articles are submitted to Commanding Officer, National Maritime Center (NMC-4A) for review and filing. The shipping articles are maintained at Commanding Officer, National Maritime Center (NMC-4A) for three years then transferred to the FRC in Suitland, MD for an additional 60 years.

9. Official Logbooks.

The Official Logbooks are permanent records. They are submitted to the nearest OCMI for review by the Investigation Department, maintained at the Marine Safety Office for six months, then transferred to the nearest FRC for 60 years. After 60 years the Official Logbooks are sent to the National Archives Regional Center for permanent storage. A record of all official logbooks and their location must be maintained by the submitting office.

10. Preparation Of Fingerprint Records.

To comply with FBI policy and procedures governing criminal record checks, a classifiable form FD-258, Fingerprint Card, must be submitted for an original license, certificate of registry, Merchant Mariner's Document and 10% of renewable licenses/MMDs and new endorsements of licenses and MMDs. Only one set of fingerprint cards needs to be submitted when the applicant applies for a license and a Merchant Mariner's Document at the same time or within 6 months of a previous application. The REC should keep a second fingerprint card on file for one year to submit in case the first fingerprint card is rejected. Particular attention must be given to obtaining legible prints. The majority of rejections are due to one or more fingers not being rolled fully, the charts being smeared as the finger is being removed from the chart, or use of too much or too little ink. Any fingerprint that is smudged or otherwise illegible will be rejected. In addition, the FBI's system will reject any card containing any discrepancy which may include a blank entry or even a middle initial inserted in the place of a full middle name. The form FD-258 must have the proper ORI code number DCCG 00000, US COAST GUARD, WASH DC. A supply of form FD-258 with the proper code may be obtained by calling Commandant (NMC-4A). Fingerprint Cards, form FD-258, shall be submitted to Commanding Officer, National Maritime Center (NMC-4A) a minimum of once each week.

PART A: MARINER CREDENTIALING**CHAPTER 8: RECORD MANAGEMENT FOR U.S. MERCHANT MARINERS**a. Applicant Fingerprint, Form FD-258.

To obtain the needed information for a criminal record check, compliance with the instructions on the back of form FD-258 is essential. Personnel must ensure that the following information is provided, either typed or legibly printed in blue or black ink.

- (1) Applicant's Name. (First, Middle, Last, Suffix)
- (2) Social Security Number.
- (3) Date of Birth.
- (4) Place of Birth.
- (5) Your No. OCA. This block must be completed with the alpha code for each REC and the applicant's social security number. The fingerprint card can NOT be processed without this code. The alpha codes are as follows:

A – Anchorage	T - Memphis
B – Baltimore	M - Miami
D – Boston	N - New Orleans
C – Charleston	Y - New York
G – Guam	P - Portland
I – Honolulu	F - San Francisco
H – Houston	S - San Juan
J – Juneau	W - Seattle
K – Ketchikan	L - St. Louis
E - Los Angeles/Long Beach	O - Toledo

EXAMPLE: For Memphis, OCA Block would read: T123456789

- (6) REC Location. The space entitled "Employer and Address" should contain the name and address of the Regional Examination Center where the application is submitted.
- (7) Reason For Fingerprinting. The reason for fingerprinting (original license, license as radio officer, certificate of registry as staff officer or MMD) must be typed or legibly printed in the space designated "Reason Fingerprinted."
- (8) Race. The space for "Race" will be completed with one of the following abbreviations only:

AI - American Indian	AN - Alaskan Native
A – Asian	PI - Pacific Islander
B – Black	H - Hispanic
W - White	

PART A: MARINER CREDENTIALING**CHAPTER 8: RECORD MANAGEMENT FOR U.S. MERCHANT MARINERS**

- b. Authenticity Of Information.
If for any reason you doubt the information provided by the applicant, a letter stating the basis for doubt (including all pertinent details and justification) shall be referred to Commanding Officer, National Maritime Center (NMC-4A) for decision.
 - c. Radio Officers.
When an applicant has been approved for a license as radio officer and subsequently, within the five year renewal period, applies for an original MMD endorsed "See License as Radio Officer," a second set of fingerprints need not be obtained or submitted to the Commandant.
 - d. Questionnaire for National Security Positions SF-86 (formally Coast Guard Intelligence Agency Check Request, Form CG-2765).
Form SF-86, Questionnaire for National Security Positions, replaces the previous form CG-2765. The SF-86 must be executed for all non-U.S. citizens born outside the U. S., attached to the application and fingerprint forms, and forwarded to Commanding Officer, National Maritime Center. The NMC will forward the completed SF-86 to Immigration and Naturalization Service for processing and verification of an alien's legal entry into the U.S. Form SF-86 is available on Form Filler. Paper copies may be ordered from regular supply sources. The applicant must complete Parts 1-14 (page #s 1-5), and sign the bottom of page 9. In addition, page 10 (Authorization For Release Of Information), must also be completed and signed.
- B. License Information System (LIS).
All license, COR, and MMD transactions are now recorded in a central computer system, the Merchant Mariner Licensing and Documentation System (MMLD). Therefore, LIS cards are no longer used.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS

A. General.

1. Additional Licenses.

As a service to mariners, RECs should tell applicants if they are eligible, as far as service is concerned, for other licenses. Applicants must be evaluated for each license. The evaluation for the additional licenses must include determining proper tonnage limitations (if any).

Candidates Applying For:

Second mate

Should Consider Applying For:

Master 1600 gross tons

Master uninspected FIV

2. Radar Observer Endorsement.

a. Upgrade From Inland To Unlimited.

Anyone with Radar Observer (Inland Waters) may upgrade to Radar Observer (Unlimited) by successfully completing a Coast Guard Approved Radar Refresher (3 day) course. Service under the Radar Observer (Inland Waters) endorsement is not required. The upgrade can be made at any time after the Radar Observer (Inland Waters) endorsement is obtained.

b. Renewing Expired Endorsements.

Anyone with an expired radar observer endorsement, regardless of the period of expiration, may renew it at anytime by satisfactorily completing either a Coast Guard approved Radar Refresher (3 day) course or a Coast Guard approved Radar Recertification (1 day) course.

c. Required Endorsement.

There are two requirements in the regulations for radar observer endorsements. One is a training requirement to qualify for licenses, the other is a manning requirement. They do not conflict.

(1) 46 CFR 10.401(g)(2) requires applicants complete an approved radar observer course in order to qualify for certain deck licenses. Once obtained, those licenses may be renewed without a current radar observer endorsement. The intent of this requirement is to substitute training (qualification as radar observer) for additional sea service called for in the Convention on Standards, Training, Certification and Watchstanding (STCW).

(2) 46 CFR 15.815 requires licensed deck officers to hold a valid radar observer endorsement at the following times: when serving on inspected radar equipped vessels of 300 gross tons or over and when serving on a towing vessel as defined in 46 U.S.C. 8904.

PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS3. Able Seaman Requirements.a. Qualification As Able Seaman.

46 CFR 10.401(g)(3) requires "qualification as an able seaman..." in order to qualify for certain deck licenses. Note that 46 CFR 10.401(g)(3) applies to ocean and near coastal licenses only. This means an applicant must have the necessary service and pass all the required examinations for the appropriate able seaman endorsement, including any written and practical examinations needed for lifeboatman if lifeboatman is required for that able seaman endorsement. (The license examination is not a substitute for the able seaman and lifeboatman examinations. See 16.C.12. of this volume.) Although applicants must meet all qualifications for the appropriate able seaman endorsement, they are not required to add the endorsement to their MMD. The intent of this requirement is to substitute training (qualification as able seaman) for additional sea service called for in the Convention on Standards, Training, Certification and Watchstanding (STCW).

b. Service As Able Seaman.

When regulations require "service as able seaman" (46 CFR 10.414(b)), mate oceans not more than 1600 gross tons), the applicant must hold an able seaman endorsement while performing the service.

4. MMD Endorsements Accompanying Licenses.

46 CFR 12.02-11(d)(1) addresses issuing MMD endorsements to licensed deck officers. Applicants who receive licenses that authorize service on vessels where MMDs are required (see 46 CFR 12.02-7), should be encouraged to obtain an MMD when the license is issued.

5. Rules Of The Road Examinations.

A rules of the road examination is only required if included as part of a professional examination, or if the applicant is increasing the scope of a license to waters covered by the international rules and has not previously passed the combined inland and international rules of the road module.

B. Creditable Service.1. Simulator Training Credited as Sea Service.

Sea service credited for satisfactory completion of a Coast Guard approved shiphandling simulator course may be credited as service at the highest license grade held at the time the course was completed. In order for a Great Lakes mate/pilot to have the simulator training credited as chief mate service, the student must have at least one discharge as chief mate. The discharge must have been issued prior to the course convening date. Bridge simulator courses do not satisfy the recency requirements of 46 CFR 10.202(e) nor the six months of able seaman service required for third mate by 46 CFR 10.407(a)(1).

2. Repeating Coast Guard Approved Courses.

A shiphandling course may be repeated for credit at each license grade unless prohibited by the course approval.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS

3. Panama Canal Service.
 - a. Towing Vessel Service.
 Personnel at the Panama Canal Commission's Marine Bureau have indicated that their towing vessels operate on what could be considered near coastal routes between 15-40% of the time, mostly on the Pacific side. Applicants may be credited with a percentage of near coastal service based on an interview or on other submitted documentation. All other Panama Canal service should be credited as inland service.
 - b. Pilot Service.
 Panama Canal pilot service can be credited on a day for day basis for inland licenses and on a three to one basis up to a maximum of 180 days toward the raise in grade of an ocean or near coastal license.
4. Service On Inland Waters Toward Upper Level Licenses.
 Service aboard vessels operating on inland waters may be credited on a two for one basis toward unrestricted ocean licenses for a maximum of six months of the required twelve months service for license upgrade. This is consistent with both 46 CFR 10.211 which allows credit for other equivalent service, and with the requirements for lower level ocean and near coastal licenses which permit substituting inland service for up to half of the required ocean or near coastal service.
5. Service On MODUs.
 Service aboard self-propelled, dynamically positioned MODUs which are not anchored or otherwise bottom bearing will be credited without restriction towards all grades of unlimited deck licenses in the same manner as conventional vessels. All other MODU service will be credited in accordance with 46 CFR 10.211(c).
6. Credit For Academy Graduates.
 Academy graduates can qualify as third mate under 46 CFR 10.407(a)(2). Their academy service can therefore be considered as equivalent to the sea service requirement for third mate (three years service in the deck department, six months of which is as able seaman). When an academy graduate that meets 46 CFR 10.407(a)(2), applies for other deck licenses such as master 1600 or master of uninspected fishing industry vessels, their academy training may be credited as three years service in the deck department, six months of which is as able seaman. None of it shall be considered service as a licensed mate. OCMI's should be cautious in crediting academy training toward licenses of not more than 100 gross tons considering section 10.B.9.b. below.
7. Service On Military Sealift Command Vessels.
 MSC's civil service personnel should present a sea service letter on MSC letterhead which will certify the sea service time. MSC will certify that time off for medical reasons, training, shore and annual leave will not be indicated as sea service.
 - a. For fleet support or High OPTEMPO ships, day for day service for underway periods. Stopovers of four days or less in U.S. ports or 14 days or less in foreign ports will be counted as sea service and credited at 100%.
 - b. Low OPTEMPO ships will be credited 60% of time served.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS

8. Service Acquired Before July 1, 1989.

Service acquired on vessels over 1000 gross tons but not over 1600 gross tons will be credited as service over 1600 gross tons toward unlimited deck licenses if it was acquired before July 1, 1989. This is because prior to the rewrite of the regulations in 1987, service on vessels over 1000 gross tons qualified applicants for unlimited tonnage licenses. The service will be accepted regardless of when application is made.
9. Service For Deck Licenses Of Not More Than 100 Gross Tons.
 - a. Proof Of Ownership And Self-Certification.

Applicants who self-certify their sea time are required to present evidence of ownership of the vessel. Proof of ownership may be the vessel's document, state registration or any other form of documentation which satisfies the OCMI that the applicant did in fact own the vessel during the period of service. This practice is to comply with a DOT inspector general audit recommendation that more of the information provided by an applicant be verified.
 - b. Minimum And Maximum Vessel Size.

The regulations do not specify either minimum or maximum vessel size for experience to qualify for deck licenses of not more than 100 gross tons, and it is not reasonable to do so by policy. Each application must be evaluated on its merit. 46 CFR 10.201(a) states that each applicant must satisfy the OCMI that he or she possesses all the qualifications for the license. Experience gained entirely on large ships is not appropriate to qualify for a small tonnage license. Likewise, experience gained entirely on sail boards, kayaks, canoes, jet skis, etc., is also inappropriate. However, OCMI's may accept a limited amount of experience gained on such vessels if the applicant's overall experience demonstrates an ability to safely operate the type of small craft envisioned by the regulations.
 - c. Age.

46 CFR 10.201(f)(2) requires applicants to be at least 18 years old to qualify for a deck license of not more than 100 gross tons. There is no minimum age for obtaining creditable sea service. However, section 10.201(a) requires applicants to satisfy the OCMI that they possess all of the qualifications necessary before a license is issued. Therefore the age at which the majority of the service was obtained should be part of the OCMI's evaluation. Each application must be evaluated on its own merit.
 - d. Operation Of Military Small Craft.

An applicant who has operated small craft while serving in the Armed Forces shall be credited for such service upon documentary evidence that operation of small craft was the applicant's primary duty during the period stated.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS

C. Raises Of Grade And Endorsements.

1. Firefighting Training.

46 CFR 10.207(f) requires applicants for a raise of grade who have not met the firefighting training requirement in section 10.205(g) to do so. This does not apply to all licenses, only those listed in 10.205(g). Any mariner who has completed approved "Firefighting (Ship)" training before December 1, 1989, does not need to attend further firefighting training.

2. Master Of 1600 Gross Tons To Third Mate.

46 CFR 10.407(c) provides for a master with a 1600 gross ton license to qualify for third mate any gross tons by showing one year as master of vessels over 200 gross tons. Section 10.402(b) states that an applicant qualifying for third mate under this section shall have a tonnage limitation placed on the license based on the applicant's qualifying experience.

3. Master 1600 GT Upon Oceans or Near Coastal Waters To Master Any GT Upon Inland Waters.

Mariners holding a license as Master 1600 GT Oceans or Near Coastal may apply for a Master Any GT Inland license utilizing 46 CFR 10.435. A tonnage limitation will be placed on the Inland license as per 46 CFR 10.402(b) and (c). Mariners may remove the tonnage limitation on the Inland license by serving one year on vessels over 1600 GT.

4. Master Of 100 GT Near Coastal To Master Of 100 GT Oceans.

The regulations do not refer separately to qualifications for master 100 gross tons oceans as they do for master 100 gross tons near coastal. Master 100 gross tons oceans is one of the tonnage increments that come under 46 CFR 10.424, the requirements for master 200 gross tons oceans. Therefore, to endorse master 100 gross tons near coastal for oceans, an applicant would have to show three years of total service, two years of which must have been as a master, mate or equivalent supervisory position while holding a license as master, mate or OUPV, or two years as licensed OUTV or second class OUTV in ocean or near coastal service. The firefighting, AB and radar observer requirements of 10.401(g) must also be met as well as additional examination requirements.

D. Tonnage Limitations.

1. Upper Level Licenses.

To qualify for an ocean or near coastal license for vessels of any gross tons, all the required service must be obtained on vessels of over 200 gross tons. Furthermore, at least one half of the required experience must be obtained on vessels of over 1600 gross tons (46 CFR 10.402(a)). If an applicant for an original or raise of grade of a license as master or mate does not have the required service on vessels over 1600 gross tons, a tonnage limitation is placed on the license based on the applicant's qualifying experience (10.402(b)). The provision made in 10.402(b) for a license issued with a tonnage limitation is for applicants lacking experience on vessels over 1600 tons, not those lacking experience on vessels over 200 tons. All of the service must have been on vessels over 200 gross tons.

PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS

2. Sail/Auxiliary Sail Licenses.

a. Vessels Not More Than 100 GT.

For Sail/Auxiliary Sail endorsements on master/mate's licenses limited to 100 gross tons or less, consider the tonnage of all the vessels listed by the applicant, and use the procedures outlined in 10.422 to compute the tonnage limitation. Hence, the license will be endorsed for steam/motor/auxiliary sail vessels with one tonnage computation, regardless of which mode the various tonnages were acquired.

b. Vessels More Than 100 GT.

For master/mate's licenses over 100 gross tons, combine the steam and motor tonnages, compute the sail/auxiliary sail separately, and place two endorsements with their respective tonnage limits on the license.

3. When Qualifying Service Is On Vessels Of Five GT Or Less.

46 CFR 10.422(e) provides that master or mate licenses issued to applicants presenting qualifying service obtained aboard vessels of five gross tons or less will be limited to vessels of no more than 25 gross tons. This provision is independent of the other provisions of section 10.422. In other words, an individual who never serves on a vessel larger than five gross tons will not be allowed to raise their tonnage limit. In order to raise that tonnage limitation, a master or mate must present evidence of service obtained aboard vessels of greater than five gross tons as follows (see 46 CFR 10.422(b)(4)):

a. An additional six months service on vessels over five gross tons will allow the tonnage to be increased to 50 gross tons; and

b. Another six months service on vessels over five gross tons (a total of twelve months service on vessels over five gross tons) will allow the tonnage limit to be increased to 100 gross tons.

E. Service Aboard Tank Vessels.

To serve as a person in charge of a cargo transfer operation, a licensed deck officer must have a MMD endorsed as "Tankerman-PIC (LG)" or "(DL)" appropriate to the cargo. The requirements for Tankerman are listed in 46 CFR Part 13.

F. River Licenses.

The 46 CFR Part 10 final rule on licensing of maritime personnel created several river licenses. This section supplements the basic structure which the regulations contain on these licenses.

1. Routes.

River licenses can be issued with three route designations; Western Rivers, Rivers other than Western Rivers, and Rivers.

2. License Examinations.

There are three different examinations for rivers licenses; 1) Master's license authorizing service on vessels of more than 200 gross tons, including 500, 1600, and any gross tons; 2) Mate's license authorizing service on vessels of more than 200 gross tons, and; 3) Master or Mate on vessels of not more than 200 gross tons. Tonnage should be determined using the qualifying service.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS

- a. All three examinations will utilize the 30 question Rules of the Road module. Because Alaskan and other rivers are governed by the COLREGS, applicants for a Rivers route or a Rivers other than a Western Rivers route who are examined with the Inland Rules of the Road module will have the standard COLREGS exclusion placed on their license.
 - b. Master and Mate examinations will each have a General module appropriate for the level. All other modules utilized will be existing or new generic modules.
 - c. Routes will be determined by which generic navigation modules are taken. Applicants for a Western Rivers route will take the OUTV Western Rivers navigation problems module. Applicants for a Rivers other than Western Rivers route will take the navigation problems module based on the Columbia River which is similar in scope to the Western Rivers module. Applicants for a Rivers route will be required to take both navigation modules.
- G. Boy Scout Sea Explorer Program.
The U.S. Coast Guard/Boy Scouts of America Inspection and Certification Agreement has been canceled. See Chapter 1, Section P.11 of this Manual.
- H. Licenses For Mobile Offshore Drilling Units (MODUs).
Holders of licenses as master, oceans, any gross tons do not have to take any additional examinations when obtaining an endorsement as offshore installation manager (OIM). Holders of such master licenses must however, meet the sea service requirements for the OIM endorsement and complete the required Coast Guard approved training courses.
- I. Liftboat Licenses.
These vessels are to be treated as if licensing individuals for Offshore Supply Vessels. The parameters for manning these type of vessels can be found in Chapter 21, Section L of this volume.
- J. T-AGOS Class Vessels.
This policy only applies to the STALWART class T-AGOS vessels, T-AGOS 1 through T-AGOS 18. They were originally admeasured as less than 1600 gross tons and later readmeasured as over 1600 gross tons. This tonnage increase prevented masters and mates limited to 1600 gross ton vessels from continuing to serve on them. The following policy is intended to allow masters and mates who have served on the STALWART class T-AGOS vessels to continue serving on them.
1. Licenses With T-AGOS Endorsements.
Licenses as master or chief mate of STALWART class T-AGOS vessels remain in effect and may be renewed. They may not be used to bypass any grade in the normal licensing progression.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING
CHAPTER 10: LICENSES FOR DECK OFFICERS2. Licenses Without T-AGOS Endorsements.

Masters and mates with 1600 ton licenses qualify for endorsements limited to STALWART class T-AGOS vessels that allow them to serve in positions they held before readmeasurement. For example, a master 1600 that served as chief mate would qualify for an endorsement as chief mate of any gross tons limited to STALWART class T-AGOS vessels. These endorsements will not be given to any other applicants. Newly hired deck officers must have an appropriate upper level license.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS**A. Introduction To Pilots.**

Pilotage in the United States has remained relatively unchanged since the days of colonization. What has evolved is a dual system of pilotage. There is a federal pilotage system, and a state pilotage system.

1. Federal Pilotage System (Not Great Lakes).

As noted in 46 U.S.C. 8502, federal pilotage applies to a coastwise seagoing vessel. A coastwise seagoing vessel, generally means one which is carrying or authorized by its documentation to engage in trade between one U.S. port and another. A vessel meeting this description must be under the direction and control of a Federally licensed pilot when the vessel is:

- a. Not sailing on register;
- b. Underway;
- c. Not on the high seas; and
- d. Propelled by machinery and subject to inspection under 46 U.S.C. Subtitle II, Part B or Chapter 37. (Subtitle II, Part B refers to the Inspection and Regulation of Vessels.)

There are a few variations regarding the Federal pilotage requirement for a coastwise seagoing vessel. First, in the area of Prince William Sound, Alaska, a coastwise seagoing vessel may qualify for certain exemptions, under certain circumstances. Refer to 46 CFR 15.812(f) for the criteria. Second, unless the Secretary determines that a hazard to navigational safety exists, a coastwise seagoing dredge is exempt from the Federal pilotage requirement. (Refer to 46 U.S.C. 8502(i)).

2. State Pilotage System.

As indicated in 46 U.S.C. 8501 and 46 U.S.C. Chapter 93, State pilotage applies to foreign trade vessels not on the Great Lakes. Foreign trade vessel means U.S. vessels sailing on registry, and foreign vessels. The requirement for a foreign trade vessel to take a State pilot varies among the States. As provided in 46 U.S.C. 8503, where there is no regulation of pilotage by the State, the Secretary may promulgate regulations which require a federally licensed pilot to be aboard a foreign trade vessel when engaged in foreign commerce and operating on the navigable waters of the United States. If the State should subsequently establish a requirement for a State pilot and notify the Secretary of that fact, the Federal pilotage requirement for foreign trade vessels would be rescinded. (Regulations promulgated under this part will be found in 46 CFR 15.1001.)

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS

3. Great Lakes Pilotage.

46 U.S.C. Chapter 93, the Memorandum of Arrangements (MOA) between the United States and Canada, and the Great Lakes Pilotage Regulations (46 CFR Parts 401-404) contain the provisions for the conditions of pilotage service on the Great Lakes for foreign trade vessels.

a. Great Lakes Pilotage Oversight.

The Coast Guard, has the responsibility to oversee and approve the pilot pools of the U.S. registered pilots which provide pilotage services on the Great Lakes. The Director of Great Lakes Pilotage determines the number of U.S. pilots needed in order to provide adequate and efficient pilotage service as described in the MOA.

b. Great Lakes Geographic Area Of Applicability.

The geographic area of applicability for pilotage on the Great Lakes includes all of the Great Lakes, their connecting and tributary waters, the St. Lawrence River as far East as St. Regis, New York, and adjacent port areas.

c. U.S. Registered Pilot.

A U.S. Registered Pilot is an individual who holds a valid first class pilot's license for the routes specified, and who also has been issued a Certificate of Registration by the Director, Great Lakes Pilotage.

d. Requirement To Take A Pilot.

A foreign trade vessel must engage a United States or Canadian Registered Pilot for the route being navigated whenever it is operating within the areas of the Great Lakes described above. This applies to all foreign trade vessels, meaning U.S. vessels sailing on registry and foreign vessels.

e. Salty Laker Trade.

For more information on this topic see 11.I of this volume.

B. Pilot Licensing.

Any individual who applies for a first class pilot's license need not hold any other license. However, the individual must satisfy certain service and round trip requirements. (Refer to 46 CFR 10.701 and 10.711)

1. Service Requirements.

An individual seeking a first class pilot's license or endorsement must meet a service requirement which is based upon a combination of the time spent in the deck department, and on vessels operating over the class of waters for which pilotage is desired.

2. Officer in Charge of Marine Inspection (OCMI) Imposed Service Requirements.

The OCMI responsible for issuing a first class pilot's license or endorsement may use his/her discretion to impose certain limitations based on the applicant's experience on a particular type and tonnage of vessel operating over a specific route for which pilotage is desired. If the route is in another OCMI zone the issuing OCMI shall obtain the concurrence of that OCMI.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS3. Substitute Service Requirements.

An applicant may substitute a portion of the standard service requirements described in 11.B.1 if he/she has nine months of shipboard experience and has completed a pilot training program approved by the Commandant. A list of approved pilot training programs is maintained by NMC.

4. Round Trip Route Familiarization Requirement And Documentation For Pilotage.

The OCMI will consider the experience and current license held by an applicant when determining the round trip requirement for an original or endorsement to an existing pilot's license. In this regard, an applicant may apply the round trips made while participating in an approved pilot training program to satisfy the route familiarization requirement. Documentation concerning these round trips must include the date, route, time of day, and name and tonnage of the vessel on which the trips were made properly certified by the master or pilot. Masters may document their own round trips for pilotage by submitting discharges and/or other acceptable proof of trips. "Observer" experience is acceptable towards satisfying the round trip requirements for route familiarization.

5. Tonnage Limitations.

To obtain a first class pilot's license or endorsement of any gross tons, the applicant must have sufficient experience on vessels of more than 1,600 gross tons (GT) while making the required number of round trips as specified by the Officer In Charge of Marine Inspection (OCMI). An applicant is considered to have sufficient experience with 18 months service in the specific capacity described in 11.B.1, and with at least two-thirds of the required round trips having been made on vessels over 1,600 GT. Otherwise, an applicant with experience on vessels of lesser tonnage may only be issued a first class pilot's license or endorsement of limited tonnage until the applicant has completed the number of round trips on vessels of over 1,600 GT as determined by the OCMI. See 46 CFR 10.711

An applicant may use the combined gross tonnage of a tug and barge(s) to obtain a first class pilot's license or endorsement of any gross tons. However, the OCMI may require that all or a portion of the applicant's experience be on self-propelled vessels of 1,600 GT or more in order to obtain a first class pilot's license or endorsement which is not restricted to tug and barge combinations.

6. Examination.

The examination subjects for an original pilot's license, and for an individual who is already licensed as master, mate or first class pilot of vessels greater than 1,600 GT are contained in 46 CFR 10.910. Information concerning development of the local knowledge portion of the exam may be found in chapter 5 of this manual.

- a. For an original first class pilot's license, the applicant must take the full examination.
- b. For an endorsement to an existing master, mate or first class pilot's license of more than 1,600 GT, the applicant need only take a partial examination covering the specific route, e.g., chart sketch and local knowledge.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS

C. Pilotage Routes For First Class Pilots And "Acting As" Pilots.

The regulations classify pilotage routes into two types, dependent upon the type of pilotage license that was issued. OCMI's will make available to interested persons, a description of the pilotage route/route segments within their respective zones. Mariners who will be completing routes, route segments and round trips to qualify as pilots (both "acting as" and applicants for a first class pilot's license) should verify in advance with the appropriate OCMI, what constitutes a qualifying trip.

1. Federal First Class Pilots.

Federal First Class Pilot's licenses are issued with endorsements which describe the geographic limits of the waters upon which the holder is authorized to serve, in accordance with 46 CFR 15.812(b)(1).

First class pilot's licenses and endorsements may be issued with inclusive route descriptions to applicants who have not made familiarization trips on every section of every waterway included within the described route. Applicants are not always required to obtain familiarization trips on each tributary along the route being applied for, nor are they always required to present evidence of having docked at each facility within the route. In addition, in many zones, applicants are not required to obtain round trips into the minor ports included in the route.

2. "Acting As" Pilots.

These individuals must complete a specified number of round trips over the route to be traversed in accordance with 46 CFR 15.812(b)(2). These individuals self-certify their qualifications for a route. They are not issued a pilot's license or endorsement that describes the specific waters upon which they are authorized to serve as pilot. For "acting as" pilots, the requirements concerning routes should parallel the route requirements for licensed first class pilots. A description of the route requirements for a licensed first class pilot and an "acting as" pilot may be obtained from the OCMI concerned. It is incumbent upon the mariner who will "act as" a pilot to determine in advance whether he/she meets the local pilotage requirements.

To qualify as an "acting as" tank barge pilot the operator should have a barge in tow for at least 2/3 of the required round trips. An OCMI may, however, further reduce or eliminate the number of round trips required with the barge in tow if he/she determines that it is appropriate for any routes or segments within the zone.

3. Docking Pilots/Masters.

In some ports, particularly on the East and Gulf Coasts, individuals frequently referred to as docking pilots or docking masters direct the docking and undocking of vessels. In most cases, these individuals are employees of tug boat companies.

Coast Guard licensing regulations do not address docking pilots or docking masters and, generally, the states also do not issue these licenses. Therefore, "docking pilot" and "docking master" are unofficial employer trade designations, rather than types of licenses.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS

Inspected, coastwise seagoing vessels, not sailing on register, when underway and not on the high seas, must be under the direction and control of a Federal pilot (46 U.S.C. 8502)(46 CFR 15.812). With respect to these vessels, the regulations are clear. If a vessel meets the above description, it must be operated under the direction and control of a federally licensed pilot at all times when it is underway in U.S. navigable waters. Any individual directing the navigation of such a vessel must have the appropriate first class pilot's license issued by the Coast Guard for the particular route in question.

4. Mooring Masters.

The regulations concerning mooring masters are found in 33 CFR 150.211.

D. License Equivalency.

The regulations recognize the ability of an individual holding a license as a pilot or a license as master, mate, or operator to serve in a related capacity within any restrictions on that license. The restrictions referred to in this case are usually associated with the tonnage and specific waters or route(s) indicated on the license.

1. Authority To Serve As Pilot.

An individual who holds a license endorsed only as master, mate, or operator may serve as a pilot under the authority of that license aboard certain types of vessels when they are underway and not sailing on register. To do so, the individual is required to make a specific number of round trips over the route to be traversed, and may have to serve aboard the type of vessel to be piloted. In 46 CFR 15.812(b)(2) the phrase "employed aboard a vessel" is interpreted to mean that the individual is a licensed member of the vessel's crew, or an appropriately licensed permanent employee of the vessel owner or operator, serving aboard the vessel.

a. Pilot Of Vessels Not More Than 1,600 GT.

An individual who holds a license as master or mate may serve as pilot of a self-propelled coastwise seagoing vessel or a vessel operating on the Great Lakes of not more than 1,600 GT subject to inspection under 46 U.S.C. Chapter 33 after making four round trips over the route to be traversed while in the wheelhouse as an observer or watchstander. If the route is to be traversed during darkness, at least one of the trips must be made during this time.

b. Pilot Of Tank Barges Not More Than 10,000 GT.

An individual holding a license as master, mate or operator may serve as pilot of a coastwise seagoing tank barge or tank barge operating on the Great Lakes of not more than 10,000 GT subject to inspection under 46 U.S.C. Chapter 37 after making twelve round trips over the route to be traversed while in the wheelhouse as an observer or watchstander. If the route is to be traversed during darkness, at least three of the trips must be made during this time. In addition, the individual must have at least six months service in the deck department on towing vessels engaged in towing.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS

c. Self Certification To Serve As Pilot.

An individual may self-certify that he/she qualifies to serve as a pilot aboard vessels described in paragraphs a or b above. If requested to do so, the individual shall provide the Coast Guard with adequate documentation concerning his/her qualifications.

2. Authority Of Pilot To Serve As.

An individual who holds a license as pilot of inspected, self-propelled vessels over 200 GT is authorized to serve as master of inspected vessels less than 100 GT, operator of uninspected passenger vessels (OUPV), and operator of uninspected towing vessels (OUTV) within any restrictions on that license. The restrictions referred to in this case apply to the specific waters or route(s) indicated on the license. (Refer to Chapter 13 of this volume regarding the authority of a pilot to serve as OUPV or OUTV).

E. Pilotage Requirements For Various Vessels.

1. Pilotage For Dual or Multi-Documented Vessels.

Pursuant to 46 U.S.C. 12103 a vessel eligible for documentation may have its certificate of documentation (COD) endorsed with one or multiple endorsements. Where a vessel possesses more than one endorsement on its COD, the actual use of the vessel determines the endorsement under which the vessel must sail. See 46 CFR 67.17-1(c). Vessels carrying two or more such endorsements are generally referred to as dual- or multi-documented vessels. For each voyage leg upon which such a vessel is engaged, it may sail under only one of its endorsements. It cannot claim to be sailing under more than one endorsement at any given time. Where a vessel is sailing under its coastwise endorsement, it is subject to Federal Pilotage requirements. Where the vessel sails under its registry endorsement, it is generally subject to state pilotage laws.

To determine if a vessel is operating under a registry endorsement, the following guidelines should be applied:

- a. carrying any domestic cargo for delivery to a foreign port;
- b. carrying any foreign cargo for delivery to a U.S. port or place embraced within the coastwise laws;
- c. carrying and foreign cargo for delivery to a foreign port (even though there may be intermediate stops in U.S. ports); or
- d. sailing in ballast from a U.S. port to a foreign port or from a foreign port to a U.S. port.

The trigger for pilotage is not whether the vessel is in coastwise trade or foreign trade, rather it is whether the vessel is sailing on a registry or a coastwise endorsement. This is significant because the emphasis is on insuring no gaps in pilotage jurisdiction even though a vessel is not, per se, engaged in trade.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS

2. Pilotage For Vessels in Ballast.

For pilotage purposes, whether the vessel is carrying cargo or passengers, or whether it is in ballast at any given moment is immaterial; all of the requirements of 46 U.S.C. 8502 still apply. 46 U.S.C. 12105 states that a vessel for which a registry endorsement is issued may be employed in foreign trade. 46 U.S.C. 12106 states that a vessel with a coastwise endorsement may be employed in coastwise trade. For pilotage purposes a vessel remains a U.S. documented vessel required to be sailing on one endorsement or the other regardless of whether the vessel is carrying cargo or passengers, or is in ballast.

3. Pilotage For "T" Boats.

Pursuant to 46 U.S.C. 8502, U.S. vessels which are inspected "coastwise seagoing vessels" may be subject to pilotage requirements.

While an individual can obtain a license to operate a "T" Boat at age 18, the 1978 Port and Tanker Safety Act established the minimum age requirement for a Federal first class pilot's license (including an "acting as" pilot) at 21 years (46 U.S.C. 7101(e)(1)).

Existing pilotage law and regulations do not permit an exemption from pilotage requirements for small gross tonnage. The "acting as" pilot established by the 1985 pilotage regulation permits coastwise seagoing vessels of not more than 1600 gross tons to satisfy their pilotage requirement by the master or mate who has, among other things, made four round trips over the route to be traversed.

4. Pilotage For Public Vessels.

Public vessels are exempt from Federal pilotage requirements, except for some Department of Transportation (DOT) vessels (see 46 U.S.C. 2109). The pilotage requirements for DOT vessels are as follows:

- a. Coast Guard and St. Lawrence Seaway Development Corporation vessels are exempt from pilotage requirements; but
- b. all other DOT vessels (such as Ready Reserve Fleet and other Maritime Administration vessels) are not exempt from pilotage requirements.

For assistance in determining the status of a vessel, it is recommended that the local Coast Guard Captain of the Port be contacted.

5. Pilotage For Dredges.

Dredges are normally exempt from Federal pilotage requirements. This exemption was granted by Public Law 101-595 of November 16, 1990 (The Federal Maritime Commission Authorization Act of 1990, title III, section 307, 46 U.S.C. 8502(i)(1) and (2)).

However, the exemption also provides that, if the Secretary determines, after notice and comment, that the exemption creates a hazard to navigational safety in a specified area, the Secretary may require that a dredge otherwise exempted by paragraph (1) take a pilot.

PART A: MARINER CREDENTIALING
CHAPTER 11: LICENSING OF PILOTS**F. Pilot License Renewal.**

At the time of renewal, an individual has two options to assure the continued validity of their first class pilot's license or endorsement. First, the individual must have made at least one round trip over the route(s) within the previous 5 years, or second, at the OCMI's discretion, the individual may be allowed to satisfy the route refamiliarization requirement by reviewing appropriate materials. In this case, the applicant may review the materials and certify to the OCMI what materials were reviewed and on what dates up to 90 days preceding renewal. If the individual does not satisfy either of the above options at the time of renewal, that portion of the pilotage license or endorsement remains invalid until one refamiliarization round trip has been made over the route. (Refer to 46 CFR 10.713)

G. Annual Physical Requirement For Pilots.

An individual who holds a first class pilot's license or endorsement or "acts as" a pilot of a vessel of 1,600 GT or more must have an annual physical examination. (Refer to 46 CFR 10.205(d)).

In accordance with 46 CFR 15.812(d), documentation proving compliance with applicable portions of the regulations, including the results of the operator's current physical examination, must be produced within a reasonable period of time, if required by the Coast Guard.

See chapter 4 of this manual for information concerning the physical requirements for an original pilot's license or endorsement to an existing license.

H. Radar Observer Requirements For Pilots.

An individual who is serving as a pilot in accordance with Federal law on an inspected vessel of 300 GT or more, and which is equipped with radar, must hold a valid radar observer endorsement. (Refer to 46 CFR 15.815(b))

I. "Salty Laker" Trade.

Canadian vessels that operate regularly on the Great Lakes during the Great Lakes navigation season but which operate outside of the Great Lakes during the non-navigation season are considered to be in this type of trade. These types of vessels would be required to engage a Great Lakes registered pilot in the designated waters of the Great Lakes on their first voyage into the Great Lakes until all foreign cargo on board is discharged or if the vessel is coming directly from a foreign port inside the system if the vessel is coming directly from a foreign port outside the system.

In addition, these Canadian vessels would be required to engage a registered pilot in the designated waters of the Great Lakes on their exit voyage from the first port where cargo is loaded, or from the last port of call within the system if the vessel is proceeding without cargo directly to a foreign port outside the system. Except as indicated above, these Canadian vessels would not be required to engage a registered pilot provided they meet all other applicable U.S. and Canadian requirements. For the purposes of the above statements, "foreign cargo" on the exit voyage means cargo destined for a port outside Canada and outside the Great Lakes, and on the entrance voyage means cargo loaded at a port outside Canada and outside the Great Lakes. A "foreign port" means a port outside Canada and outside the Great Lakes. For more information on Great Lakes pilotage, see Chapter 93 of Title 46, United States Code.

--	-------

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

A. Additional Endorsements.

As a service to mariners, RECs should advise applicants when they may be eligible, as far as service is concerned, for other endorsements. Applicants must of course be evaluated for each endorsement. The evaluation for the additional endorsements must include determining proper horsepower limitations (if any). Refer to Figure 12-1 to see if additional examinations are required.

<u>Candidates Applying For:</u>	<u>Should Consider Applying For:</u>
First assistant engineer	Chief engineer (Limited-Oceans)
	Chief engineer uninspected FIV
	Designated duty engineer - Unl.
Second assistant engineer	Chief engineer (Limited-Oceans)
	Chief engineer (Limited-N/C)
	Chief engineer uninspected FIV
	Designated duty engineer - Unl.
Third assistant engineer*	Designated duty engineer - Unl.
	Designated duty engineer - Ltd.
Chief engineer (Limited-O)*	Chief engineer uninspected FIV
Chief engineer (Limited-NC)	Chief engineer uninspected FIV
	Designated duty engineer - Unl.
Assistant engineer (Limited)	Designated duty engineer - Unl.

*NOTE: There is no need for a chief engineer (Limited-Oceans) to have a DDE endorsement since that chief engineer license covers every case where a DDE could be employed.

PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

B. MMD Endorsements Accompanying Licenses.

Engineers holding licenses that authorize service on inspected vessels of more than 2000 horsepower are entitled by 46 CFR 12.02-11(d)(2) to an MMD endorsed for any unlicensed rating in the engine department. Such license holders should be encouraged to obtain an MMD when the license is issued. In many cases an MMD is required to legally serve aboard a vessel. (See 46 CFR 12.02-7).

C. Creditable Service.

1. Minimum Vessel Size.

All service must be on vessels of at least 100 gross tons. This is consistent with the requirements for ratings as a qualified member of the engine department. See section 12.C.8 for exceptions for designated duty engineers.

2. Watchstanding Requirements.

Traditionally, the Coast Guard has held watchstanding experience to be an important part of the professional development of third and second assistant engineers. Technological and design advances over the last several years have led to the development of ships that can operate with unattended engine rooms. The certificates of inspection for such vessels still require licensed engineers to be on board (the engineer being on call as needed). Since the engineers are on call, such service shall be treated as though the license holder were in charge of a watch and will be creditable for a raise in grade

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

FIGURE 12-1: MULTIPLE ENGINEERING LICENSE EXAMINATIONS

Individuals applying for multiple engineering licenses need only be examined by one examination series. The examinations in the left-hand column adequately test for any additional endorsements that is marked on the corresponding horizontal line. The additional endorsements shall be of the same propulsion mode(s) for which the applicant is examined. Any horsepower limitations associated with the application will also apply to the additional engineering licenses. Refer to Figure 19-1 for engineering license equivalencies

ADDITIONAL ENDORSEMENTS PERMITTED							
EXAM SERIES	CHIEF- LTD OCEANS	CHIEF LTD N/C	ASST. ENG. LTD	CHIEF UFIV	ASST. ENG. UFIV	DDE UNLTD	DDE LTD

CHIEF LTD — NEAR COASTAL				•		•	
ASST. ENGINEER LTD					•	•	
CHIEF ENGINEER UFIV			•				•
ASST. ENGINEER UFIV							•
DDE UNLIMITED¹			•		•		
DDE LTD							

1. Graduates of a maritime academy with a third assistant engineer license and endorsed with DDE Limited, may apply for DDE Unlimited after obtaining six months sea service as a DDE Limited and a letter of recommendation from the company with whom they served, and be granted the endorsement without further testing.

PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

3. Service Under License In Lieu Of Service Under QMED Rating.
46 CFR 12.02-11(d)(2) implies that either a license for inspected vessels of more than 2000 horsepower (1500 kW) or an MMD endorsed for "Any Unlicensed Rating" in the engine department authorizes the holder to serve in any unlicensed capacity in the engine department. Unlicensed service obtained under such a license is acceptable even if the mariner did not hold the accompanying MMD endorsement. However, the service must have been legal, e.g., an MMD was not required under 46 CFR 12.02-7 or the mariner held an MMD with entry ratings.
4. Illegal Service.
Unlicensed service as assistant engineer or chief engineer on ocean or near coastal vessels of 200 gross tons or more is illegal and is not creditable service. The only exceptions to this are public vessels, wooden vessels of primitive build and barges.
5. Service On Uninspected Vessels.
When upgrading unlimited licenses, third, second and first assistant engineers frequently present time served as engineer on uninspected vessels that are not required to have licensed engineers and do not have engineering watchstanders. Service on these vessels may be credited as third or second assistant engineer service (depending on the license held) if the applicant was a full-time engineer and was responsible for the engineering plant. It may not be credited as first assistant engineer service since vessels that do not require licensed engineers usually do not have auxiliary, cargo and electrical systems comparable to vessels with licensed engineers. Only service as an actual first assistant engineer can satisfy the first assistant engineer requirements for advancement to unlimited chief engineer.
6. Service As Chief Or Assistant Engineer (Limited) Or DDE.
Service as chief engineer (limited), assistant engineer (limited) or DDE, may be credited as third or second assistant engineer service (depending on the license held). Only service as an actual first assistant engineer can satisfy the first assistant engineer requirements for advancement to unlimited chief engineer.
7. Qualifying Service For Chief Or Assistant Engineer (Limited).
The phrase "equivalent supervisory position" concerning qualifications for licenses as chief and assistant engineer (limited), refers to service in a position as an engineer rating on vessels where engineering licenses and QMED ratings are not required (e.g., tugs, fishing vessels, etc.).
8. Qualifying Service For Designated Duty Engineer (DDE).
The above interpretation of "equivalent supervisory position" also applies to DDE. To be creditable toward DDE, the service must have been as a full time engineer in an operating engine room. OCMI's may accept service on vessels less than 100 gross tons provided the vessel has a "walk in" engine room with an engineering plant comparable to vessels over 100 gross tons (e.g., electrical generators and other auxiliaries independent of the main engines).

PART A: MARINER CREDENTIALING**CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS**

9. Credit For Academy Graduates: Limited Chief Engineer.
When academy graduates, who are qualified as third assistant engineer under 46 CFR 10.516(a)(3), apply for licenses as chief engineer (limited - oceans), chief engineer (limited - near coastal), or chief engineer of uninspected fishing industry vessels (UFIVs), they may be allowed three years sea service credit for their academy training, when they have acquired one year of sea service as a licensed engineer. Two years of the credit may be considered, for evaluation purposes only, as QMED service. None of it shall be considered service as a licensed engineer.
10. Academy Graduates: Designated Duty Engineer-NMT 4000 Horsepower.
When an academy graduate can demonstrate that industry specific training has been provided prior to graduation, an endorsement for designated duty engineer (DDE) - Limited-4000 hp (3000 kW), may be applied for and added to a third assistant engineer license without further testing. Where the training program is unable to demonstrate that industry specific training has been provided prior to graduation, the applicant may reapply for the endorsement after completing the following:
- a. 60-days of sea service in any capacity in the engine room; or,
 - b. an approved program of industry specific training following graduation.
11. Credit For Academy Graduates: Designated Duty Engineer-Unlimited.
Since persons serving under a DDE Unlimited license may be the sole engineer on board these vessels and do not have a more experienced engineer to turn to, hands-on experience as a DDE-Limited Engineer is an important supplement to their onshore training. When applying for an endorsement as designated duty engineer (DDE) -Unlimited HP (more than 4000 hp/ 3000 kW), they may be allowed, for the purpose of evaluation only, to present a written recommendation on company letterhead after six months sea service in a licensed capacity and be granted this endorsement without further examination.
12. Maritime Administration Vessels In Reduced Operating Status (ROS).
The Maritime Administration maintains some of their vessels in ROS with a limited crew, usually by contract with a commercial shipping company. Service on ROS vessels will be credited as normal sea service when they are underway and fully manned. During all other times service should be credited as follows:
- a. For Original Third Assistant Engineer.
One day credit for every three days worked up to a maximum of three months credit. None of the credit shall be considered QMED service.
 - b. Raise Of Grade.
Service as a licensed engineer will be evaluated under 46 CFR 10.211(b)
 - c. License Renewal.
One day credit for every three days worked toward meeting the sea service requirement for renewal.
 - d. License Endorsements.
No credit will be given toward horsepower increases or qualification in another propulsion mode.

PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

13. Service On T-AKR Fast Sealift Ships.

The T-AKR fast Sealift ships (former Sealand SL-7s) are maintained in reduced operating status with a partial crew. The crew receives experience that is similar, to a degree, to the experience received on an underway vessel. However, the engineers do not normally stand "steaming" watches while in reduced status. Therefore, first assistant engineers may receive 50 percent credit for their service, up to a maximum of six months creditable service. Third and second assistant engineers may only receive credit for underway watchstanding service.

D. Propulsion Modes.

Engineering licenses are issued for service on steam vessels or motor vessels, or both.

1. Minimum Service Requirements.

For original or raise of grade of engineer licenses, at least one-third of the required service must have been obtained on vessels of the particular mode of propulsion for which application is made. An applicant holding a license endorsed for a single propulsion mode may qualify in the other propulsion mode by meeting one of the provisions of 46 CFR 10.502(b). Applicants may also qualify by accumulating the additional time needed to have one-third of the total required experience on vessels of that mode. This is one of the few instances where service acquired before the issuance of a license may be used for the addition of an endorsement (46 CFR 10.207(c)(3)).

EXAMPLE: A third assistant engineer of steam and motor vessels (3 A/E Steam & Motor) presents ten months service on motor vessels and 2 months service on steam vessels. The applicant qualifies for second assistant engineer of motor vessels (2 A/E Motor) but lacks two months service on steam vessels to qualify as 2 A/E Steam. After obtaining the license as 2 A/E Motor, the applicant may later obtain two more months service as 3 A/E Steam and qualify for 2 A/E Steam.

2. Gas Turbine Vessels.

A motor license and a steam license both qualify the holder to serve on board gas turbine propelled vessels. No specific endorsement is needed. Service obtained aboard gas turbine propelled vessels may be credited as both motor service or steam service, but can not be credited twice. For example, an applicant for a raise of grade from 3 A/E of Steam and Motor Vessels to 2 A/E of Steam and Motor Vessels has 360 days of gas turbine service. The time may be credited as 120 days towards each mode and 120 days towards satisfying the 360 day requirement.

3. Coast Guard Approved Courses.

A course approved for engineers adding a propulsion mode may be repeated for credit at each license grade.

PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

4. Equivalent Service.

Equivalent service allowed under 46 CFR 10.211(b) is considered as neither motor service nor steam service. It can be used to meet the total service requirements but not the service required to qualify for a particular mode of propulsion. Credit given for academy service is neither steam service nor motor service. The one-third criteria of 46 CFR 10.502(a) for qualifying in a particular propulsion mode should only be applied to the service needed along with the academy credit.

E. Horsepower Limitations.

Total main engine shaft horsepower is to be used when evaluating engineering service. The horsepower of auxiliaries will not be considered regardless of how large they may be. Refer to the Marine Safety Information System (MSIS), Merchant Vessels Of The United States, CG-408, and publications such as Jane's Fighting Ships and Lloyd's Register for horsepower.

1. Raising Or Removing Horsepower.

The procedures for raising or removing horsepower limitations on licenses are contained in 46 CFR 10.502 and 10.503. Cases requiring special consideration may be referred to NMC-4C for evaluation.

2. Minimum Service.

For engineers qualifying in both propulsion modes, the horsepower limitation will be computed for each propulsion mode. 46 CFR 10.502 requires one third of the minimum service requirements to be on the particular propulsion mode for which applied. If all of that "one third" is on vessels of at least 4000 horsepower, the applicant qualifies for an unlimited horsepower license in that mode. If it is not, compute a horsepower limitation for that propulsion mode by applying the 25 percent and 50 percent criteria of 46 CFR 503(b) to the entire minimum service requirement.

3. Limited Engineering License Raises Of Grade (Other Than Designated Duty Engineers).

Although the regulations state the service requirements for all limited engineer licenses in terms of the total service required, horsepower limitations for raises of grade should be determined based on the additional service needed for the raise of grade.

EXAMPLE: An assistant engineer of uninspected fishing industry vessels applies for a raise of grade to chief engineer and presents a year of service in addition to the three years already presented to qualify for the assistant engineer license. Although 46 CFR 10.530(c) requires four years of service to qualify for this license, the horsepower limitation should be based on the one year of additional service needed to raise the license from assistant engineer to chief engineer. This is consistent with the way horsepower limitations are determined for upper level licenses. However, for an original license as chief engineer of uninspected fishing industry vessels, the horsepower limitation is based on the entire four years of service required.

PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

4. Designated Duty Engineer.

The only horsepower levels for designated duty engineer are 1000, 4000, and any horsepower. They are determined by the amount of qualifying service rather than the horsepower of the vessels on which the service was obtained. The criteria for each limit is set forth by 46 CFR 10.524(b).

F. Fishing Industry Vessel Licenses.

Fishing industry vessel licenses are only needed for offshore service. They are issued to comply with 46 U.S.C. 8304, which requires engineers on vessels of at least 200 gross tons operating upon the high seas to be licensed.

G. Service Aboard Liquefied Natural Gas (LNG) Vessels.

The chief engineer, first assistant engineer and cargo engineer serving aboard LNG vessels shall be specially trained to carry out their duties. Successful completion of an approved Tankerman - PIC LG course can be used for this purpose.

H. OCMI's Discretion.

In unusual circumstances, an OCMI may endorse a license for a limited increase in horsepower in a lower grade, after reviewing the applicant's experience, the license(s) held, and examinations taken. Similarly, the OCMI may permit an applicant holding a license endorsed for 4000 horsepower or more to be examined for a raise to the next higher grade of license. This shall be limited to 20 percent of the horsepower of the license held (not to exceed 2000 horsepower). These provisions shall be used only when the applicant has a firm commitment of employment; the increase in scope or raise of grade shall be limited to cover the vessel to which the applicant will be assigned. Extreme caution must be applied in cases of this nature.

I. Licenses For Mobile Offshore Drilling Units (MODUs).

The regulations prescribe chief engineer and assistant engineer licenses for MODUs. They permit service on both self- propelled and non-self-propelled units. In every case a certain amount of service is required to be on self-propelled units to qualify for a MODU license.

1. Licenses Limited To Non-Self-propelled MODUs.

Although the regulations do not provide for licenses limited to non-self-propelled MODUs, the Coast Guard recognizes there is a need for such licenses. A license limited to non-self-propelled MODUs may be issued to applicants that qualify for a standard MODU license in all respects, including total sea service, other than having the required service aboard self-propelled MODUs. Such applicants may elect to take a limited examination. A limited examination is a standard examination with inapplicable questions deleted.

2. Removing Non-Self-Propelled Limitations.

Licenses limited to non-self-propelled MODUs may be converted to standard MODU licenses by showing the necessary service aboard self-propelled MODUs and completing any examination deficiencies.

PART A: MARINER CREDENTIALING
CHAPTER 12: LICENSING FOR ENGINEERING OFFICERS

J. North American Trailing Company Self-Propelled Dredges.

North American Trailing Company owns four self-propelled dredges that are over 2200 gross tons. Chief engineers (limited) and designated duty engineers may serve on the vessels as licensed engineers on inland waters, but because of the vessels' tonnage, not on the Great Lakes or offshore waters. Unlimited chief and assistant engineer licenses are needed to serve aboard the vessels when they operate on the Great Lakes or offshore. To meet the needs of the industry, a holder of a second assistant engineer license of motor vessels of any horsepower may upgrade to a chief engineer license limited to the dredges operated by North American Trailing Company of not more than 5000 horsepower. The applicant must submit a letter from the company requesting this limited chief engineer license and pass the engineering safety module of the chief engineer's examination. The intent of the endorsement is for the company to meet the manning requirements and allow licensed engineers on board North American Trailing Company's dredges to continue to obtain qualifying service toward a first assistant engineer license.

K. T-AGOS Class Vessels.

This policy only applies to the STALWART class T-AGOS vessels, T-AGOS 1 through T-AGOS 18. They were originally admeasured as less than 1600 gross tons and later re-admeasured as over 1600 gross tons. This tonnage increase prevented chief engineers (limited) and assistant engineers (limited) from continuing to serve on them. The following policy is intended to allow engineers that have served on the STALWART class T-AGOS vessels to continue serving on them. Service aboard them is creditable toward unlimited licenses (note: they are 1600 horsepower).

1. Licenses With T-AGOS Endorsements.

Licenses as chief engineer or first assistant engineer of STALWART class T-AGOS vessels remain in effect and may be renewed. They may not be used to bypass any grade in the normal licensing progression.

2. Licenses Without T-AGOS Endorsements.

Chief engineers (limited) qualify for endorsement as chief engineer of STALWART class T-AGOS vessels if they served as chief engineer on them. They qualify for endorsement as first assistant engineer of STALWART class T-AGOS vessels if they served as assistant engineer aboard them. Second and third assistant engineers and assistant engineers (limited) qualify for endorsement as first assistant engineer of STALWART class T-AGOS vessels if they served as assistant engineer aboard them. These endorsements will not be given to any other applicants. Newly hired engineers must have an appropriate upper level license.

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS****A. Operator Uninspected Towing Vessels (OUTV).**

The Coast Guard's authority to issue licenses for Operators of Uninspected Towing Vessels (OUTV) can be found under Title 46 U.S.C. 7101. Title 46 U.S.C. 8904 requires licensed operators aboard all commercial vessels of 26 or more feet in length engaged or intending to engage in the act of towing. The only exception are vessels of less than 200 gross tons engaged in the mineral and oil industry and having offshore mineral and oil industry sites or equipment as their ultimate destination or place of departure. When on the high seas, OUTVs are limited to vessels less than 200 gross tons. This is to conform with the Officers' Competency Certificates Convention, 1936, 46 U.S.C. 8304, which requires vessels of 200 gross tons or more on the high seas (seaward of the Boundary Line) be manned by licensed masters and mates.

1. Background On Routes.

When the OUTV license was originated in 1973 there were five general routes: oceans, oceans not more than 200 miles offshore, inland, Great Lakes, and Western Rivers. The routes were compatible with the four different sets of navigation rules in effect at the time: COLREGS, Inland, Great Lakes, and Western Rivers. Applicants had to be examined on the rules applicable to each route. Except for the ocean routes each route was separate with no route being superior to another. Applicants qualifying for ocean routes also qualified for inland waters without showing 90 additional days on inland waters. Experience on ocean routes would necessarily include service on inland waters since ocean voyages would begin and end on inland waters. When the inland navigation rules were later applied to all inland waters including Great Lakes and Western Rivers, the Coast Guard determined that the route for inland waters should include Western Rivers and Great Lakes.

2. Current Routes.

OUTV licenses are issued with the following routes. Each route includes all the routes listed below it. Although masters and mates may have routes for Western Rivers, rivers other than Western Rivers, or (all) rivers, these route descriptions are not the ones that apply to OUTV. The route descriptions to be used for OUTV are prescribed by 46 CFR 10.464(b) and are listed below. OCMI's should use the routes listed. Limited local routes should be used when an applicant requests or when an applicant's experience is so limited that a limited route is necessary

- a. Oceans (domestic trade) waters;
- b. Near coastal waters;
- c. Great Lakes and inland waters;
- d. Western Rivers; and
- e. Limited local area designated by the OCMI.

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS**3. Route Endorsements.a. Qualifying Experience.

An OUTV seeking an increase in scope satisfies the service requirement of 46 CFR 10.464(c)(1)(iii) by presenting three months of service in the highest route applied for. For example, an applicant with a Western Rivers OUTV license seeking an endorsement for near coastal waters need only present evidence of three months of service on near coastal waters. Service on Great Lakes or inland waters is not required.

b. Examinations.

Check Commandant Publication P16721.35, Guide for Administration of Merchant Marine Deck Examinations (Deck Guide) to see what additional testing may be required for an increase in scope. A rules of the road examination should be given to all applicants for additional endorsements unless the exam was completed within the last 12 months.

c. Ocean (Domestic Trade).

Note that 46 CFR 10.464(e) has firefighting, radar observer and able seaman requirements for the ocean (Domestic Trade) route. "Qualification as Able Seaman..." in this regulation has the same meaning as when it is used in 46 CFR 10.401(g). See section 10.A.3 of this volume for a discussion of this requirement.

d. Oceans.

Prior to implementation of the new licensing structure in 1987, some OUTVs held unlimited ocean routes. Those licenses did not conform to STCW so when they were renewed they were reissued as "Master of Ocean Motor Vessels of not more than 200 gross tons (restricted to uninspected towing vessels); also Operator of Uninspected Towing Vessels Great Lakes and Inland." The OUTV phrase must be included because the 200 gross ton limitation should not apply on Great Lakes and inland waters. These licenses may not be modified. To increase tonnage or obtain a standard master's license, applicants must be evaluated as an OUTV upgrading to master. These existing licenses may be renewed; however, no original licenses with the above endorsement shall be issued.

e. Limited Routes.

When requested by an applicant, OCMI's should liberally interpret their authority to issue licenses with limited local routes. For example, an OUTV Western Rivers wants to operate on the Gulf Intercoastal Waterway but does not want to take the entire inland OUTV exam. The OCMI may modify an inland exam by deleting inappropriate questions and issue an inland endorsement with appropriate limitations. The intent of having limited local routes is to give applicants the option of taking a simplified or limited examination if they only need a limited license. It is not intended to be a tool for the OCMI to limit the applicant to a small geographic area.

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS**4. Oral-Assisted Examinations For OUTVs.

46 CFR 10.205(i)(1) provides for oral examinations for applicants who have demonstrated difficulty in reading and understanding the exam questions. An OUTV license issued as a result of an oral-assisted exam shall be limited to the specific route upon which the majority of experience was obtained rather than the standard broad routes. The route is limited because such applicants, with limited reading ability, have only their past experience to rely on while operating. Applicants who can pass a written examination can refer to references such as the coast pilot when operating in areas where they have no experience. Applicants should also be evaluated to determine if they can read and understand cargo information cards. If not, the license shall preclude service on vessels towing (regardless of mode) barges carrying cargoes regulated under 46 CFR, Subchapter O.

5. Advancement To Other Licenses.

Many master and mate licenses do not have a specific provision for using OUTV service. For those licenses, service as OUTV should be considered to be equivalent to service as mate. It should not be considered to be equivalent to service as master.

6. Masters, Mates, Pilots Obtaining OUTV Licenses.a. Background.

When the OUTV license was instituted in 1973, many master and mate licenses had trade restrictions or narrow geographic limitations. In keeping with Congress's intention when the OUTV license was created, the Coast Guard's policy has been to allow masters, mates and pilots to operate uninspected towing vessels in circumstances not authorized by their licenses by providing an easy means to obtain an OUTV license. Depending on the license held, the OUTV license could be obtained merely upon request or by showing some additional service and passing a limited examination.

b. Masters And Mates.

There is no longer a need for policies that provide special paths from master or mate to OUTV. The current licensing structure no longer contains master or mate licenses with trade restrictions (except uninspected fishing industry vessels) or narrow geographic limitations. In addition, 46 CFR 15.910 allows many masters and mates to serve as OUTV without specific endorsement although the limitations on some licenses do apply. (See chapter 19 of this volume for more detailed information.) Masters and mates who want an OUTV license must meet all the requirements of 46 CFR 10.464.

c. Pilots.

Licensed first class pilots may obtain a license as OUTV upon application. No additional service is required. Applicants must pass an appropriate rules of the road examination if they have not passed such an exam within the last 12 months. The training requirements of 46 CFR 10.464(e) apply if the license is for ocean (domestic trade) waters. The route of the OUTV license will be for the broad geographic area

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS**

that includes the waters authorized on the pilot license. For example, "First class pilot on the Chesapeake Bay" would qualify for an OUTV license for Great Lakes and inland waters; "On the Mississippi River" would qualify for an OUTV license for Western Rivers; and "[Any portion of the] Great Lakes" would qualify for an OUTV license for Great Lakes and inland waters.

B. Operator Uninspected Passenger Vessels (OUPV).

The Coast Guard's authority to issue licenses for operators of uninspected passenger vessels (OUPV) can be found under Title 46 U.S.C. 7101. Title 46 U.S.C. 8903 requires each self-propelled uninspected passenger vessel, as defined in 46 U.S.C. 2101, to be operated by a licensed operator. Vessels such as pure sail vessels, oar-propelled vessels and white-water rafts are not considered self propelled and therefore do not require licensed operators

1. Service Requirements.

a. General Experience.

An applicant for a license as operator of uninspected passenger vessels must present evidence of at least one year's experience in the operation of vessels. However, 46 CFR 10.202(h) allows the OCMI to reduce the service requirements. If service requirements are reduced, the license should have appropriate restrictions.

b. Proof Of Ownership And Self-Certification.

Applicants who self-certify their sea time are required to present evidence of ownership of the vessel. Proof of ownership may be the vessel's document, state registration or any other form of documentation that satisfies the OCMI that the applicant did in fact own the vessel during the period of service. This practice is to comply with a DOT inspector general audit recommendation that more of the information provided by an applicant be verified.

c. Minimum And Maximum Vessel Size.

The regulations do not specify either minimum or maximum vessel size for experience to qualify for an OUPV license and it is not reasonable to do so by policy. Each application must be evaluated on its merit. 46 CFR 10.201(a) states that each applicant must satisfy the OCMI that he or she possesses all the qualifications for the license. Experience gained entirely on large ships may not be appropriate to qualify for an OUPV license. Likewise, experience gained entirely on sail boards, kayaks, canoes, jet skis, etc., may also be inappropriate to qualify as an OUPV. However, OCMI's may accept a limited amount of experience gained on such vessels if the applicant's overall experience demonstrates an ability to safely operate the type of six-passenger craft envisioned by the law. When upgrading a limited jet ski license issued under paragraph 13.B.2.b, the jet ski service used to qualify for it shall be credited toward the service required to qualify for an unrestricted OUPV license.

d. Service Upon Other Types Of Small Craft.

Service on various types of motor-propelled craft of reduced size, such as yachts, fishing boats, tugs, and public vessels shall be credited upon documentation that the applicant's service was directly related to the operation of such vessels.

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS**

- e. Operation Of Military Small Craft.
An applicant who has operated small craft while serving in the Armed Forces shall be credited for such service upon documentary evidence that underway operation of small craft was the applicant's primary duty during the period stated.
2. Routes And Limitations.
An operator of uninspected passenger vessels is limited to either near coastal waters (not more than 100 nautical miles (200 km) offshore), Great Lakes and inland waters, or inland waters (not including the Great Lakes). An OCMI may restrict a license to a limited geographic area when the qualifying experience is very limited in scope; operators of tenders at yacht clubs and marinas for instance.
- a. Boy Scout Sea Explorer Program.
The U.S. Coast Guard/Boy Scouts of America Inspection and Certification Agreement dated 1 October 1979, has been cancelled. See Chapter 1, paragraph P.11 of this manual.
 - b. Jet Skis.
Although operating jet skis is not considered appropriate as the sole means to qualify as an OUPV, there are instances when jet ski operators must be licensed. Therefore, OCMI's may issue licenses for jet ski operators following the same philosophy and requirements contained in 46 CFR 10.466(g) for formal camps, yacht clubs and marinas. Applicants must document a need for such a license. Licenses should be very limited as to type of service and area of operation. As discussed above, only a limited amount of service on jet skis can be accepted toward an unrestricted OUPV license.
 - c. Navigable Waters Of The U.S.
At one time OUPV licenses could be issued with the route, "navigable waters of the United States." That route encompassed coastal waters of the United States not more than 3 miles offshore and many internal waters. This route is no longer used when issuing original OUPV licenses; however, existing licenses should be renewed without change unless the holder qualifies for a route extension to near coastal waters (not more than 100 miles (200 km) offshore).
3. Age.
46 CFR 10.201(f)(2) requires applicants to be at least 18 years old to qualify for an OUPV license. Part 10.202(h) allows the OCMI to lower the age requirement. The OCMI must determine if the lower age limit makes putting restrictions on the license appropriate.
4. OUPV To Master, Mate And Increase In Scope.
- a. Creditable Service.
46 CFR 10.207(c)(3) does not prohibit experience used to qualify as an OUPV from being used to meet the service requirements for limited master or mate licenses.
 - b. To Mate Great Lakes And Inland.
Applicants holding OUPV licenses may advance to Mate Great Lakes and Inland 100 gross tons by taking a partial exam as permitted by (46 CFR 10.454(d)). Commandant

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS**

Publication P16721.35, Guide for Administration of Merchant Marine Deck Examinations (Deck Guide) specifies the partial exam to be given. Note that to obtain a Great Lakes route, the applicant must have three months of service on the Great Lakes.

c. To Mate Near Coastal.

Applicants holding OUPV licenses with a near coastal route may advance to Mate near coastal by passing a partial exam based on the Subchapter T regulations (46 CFR 10.427(b)). Commandant Publication P16721.35, Guide for Administration of Merchant Marine Deck Examinations (Deck Guide) specifies the partial exam to be given. Note that this only addresses the examination to be taken. It does not relieve an OUPV (only 90 days of offshore service required) from having the 180 days of offshore service required by 46 CFR 10.427(a)(1) for mate.

d. To Master.

Per 46 CFR 10.903, an OUPV who applies directly for a license as master must take the entire examination for master. Many applicants choose to avoid the master exam by taking the partial exam for mate and then upgrading to master by showing the required experience with no additional exam required. Even if an OUPV accomplishes this during a single visit, RECs should consider it two transactions: OUPV to mate, then mate to master.

e. Inland To Near Coastal.

Applicants increasing the scope of their licenses from OUPV inland to near coastal, need only show the necessary offshore service. A rules of the road examination is only required if the combined inland and international rules module was not previously passed. A practical navigation module is also required if the applicant did not take a practical navigation test as part of the OUPV exam. (Practical navigation modules were not part of OUPV exams prior to December 1987.)

5. OUPV License Endorsed On Master/Mate License.

If an OUPV holds a master or mate license, the OUPV license will be endorsed on it; separate licenses will not be issued.

C. Uninspected Fishing Industry Vessels (UFIVs).

1. General.

A Fishing Industry Vessel License is issued for ocean and near coastal routes only. 46 U.S.C. 8304, with certain exemptions, requires all masters and mates on all vessels of at least 200 gross tons operating upon the high seas to be licensed. The only difference between the requirements for the ocean and near coastal license is the examination. For a license limited to near coastal waters the celestial module will not be administered.

PART A: MARINER CREDENTIALING**CHAPTER 13: LICENSING FOR OPERATORS OF UNINSPECTED VESSELS****2. Qualifications For License As Master.**

Applicants require four years of total service on ocean or near coastal routes. One year of this service must have been as licensed master, as unlicensed master, or as licensed mate or equivalent supervisory position while holding a license as master, mate, operator of uninspected towing vessels, or operator of uninspected passenger vessels. It has been determined that the wording "unlicensed master" refers to an unlicensed individual in charge of operating uninspected fishing industry vessels of less than 200 gross tons or those fishing industry vessels over 200 gross tons operating solely within the Boundary Line.

3. Tonnage Limits.

There are three criteria for determining tonnage limitations for licenses for uninspected fishing industry vessels; service on vessels over 50 gross tons; service on vessels over 100 gross tons; and computations under 46 CFR 10.402(b) based on the size of vessels constituting 25% and 50% of the qualifying service. Each method is independent of the others. Apply the criteria that results in the highest tonnage limitation.

[EXAMPLE: An applicant for master UFIV has all qualifying service on a vessel of 800 gross tons.]

FIRST CRITERIA: More than two years of the service (including mate) was on vessels over 50 gross tons so applicant qualifies for a 500 gross ton limitation.

SECOND CRITERIA: More than two years of the service (including mate) was on vessels over 100 gross tons so applicant qualifies for a 1600 gross ton limitation.

THIRD CRITERIA: Qualifies for the highest tonnage on which 25% of the service was performed. That tonnage is 800 gross tons, which rounded up to the next thousand, is 1000 gross tons. Also qualifies for 150% of the highest tonnage on which 50% of the required service was performed. 150% of 800 gross tons is 1200 that, rounded up to the next thousand, is 2000 gross tons.

RESULT: Of the tonnages computed (500, 1000, 1600 and 2000), 2000 gross tons is the highest so the applicant qualifies as master of UFIV of not more than 2000 gross tons.

5. Merchant Mariner's Documents (MMDs) For Radio Officers	A14-3

PART A: MARINER CREDENTIALING
CHAPTER 14: STAFF AND RADIO OFFICERS

A. Certificates Of Registry As Staff Officers.

1. Statutory Authority.

The authority for the issuance of certificates of registry is in 46 U.S.C. 7101. Statutory qualifications for certificates of registry are in 46 U.S.C. 7102, 7104, 7105, 7107, 7108 and 7109.

2. General.

The statutes allow only certificates of registry to be issued for pursers, medical doctors (formerly surgeons) and professional nurses. The regulations specify various grades of purser. There are no grades for medical doctor or professional nurse.

3. Ratings.

The holder of a certificate of registry may apply to have a rating endorsed on the certificate. The only ratings currently allowed are: marine physician assistant and hospital corpsman.

a. Marine Physician Assistant.

To qualify for an endorsement as marine physician assistant, an applicant must successfully complete an accredited course of instruction for a physician's assistant or a nurse practitioner program. Physician's assistant courses must be approved by the American Medical Society or the National Commission on Certification of Physician's Assistants. When answering inquiries from the public, it is important to understand that the marine physician assistant rating only means the holder has met the Coast Guard's requirements for that rating. It does not necessarily mean that the holder meets the requirements of any other federal, state, or local agency for physician assistants.

b. Hospital Corpsman.

The requirements for this rating are fully explained by 46 CFR 10.809(b).

c. Pharmacist's Mate.

Original endorsements as pharmacist's mate are no longer issued. The holder of a pharmacist's mate rating may renew it or convert it to a hospital corpsman rating.

4. Justifying The Need For Certificates Of Registry.

46 CFR 10.805 requires that applicants present a letter justifying the need for the certificate of registry. This applies to all applicants, both civilian and military. It also applies to all original certificates of registry regardless of the grade of the certificate. The wording of the regulation is vague and does not prohibit the applicant from writing the letter. Regardless of the source of the letter, OCMI's must be satisfied that there is a real need for the certificate of registry. Note that staff officers are only required to be registered if they serve on Great Lakes vessels (other than those ferrying passengers and cars) and ocean vessels. (46 U.S.C. 8302)

PART A: MARINER CREDENTIALING
CHAPTER 14: STAFF AND RADIO OFFICERS

5. Expiration.
46 U.S.C. 7107 requires certificates of registry be issued for five-year periods with the understanding that radio officers must keep their FCC license valid for their license or document to be valid.
6. Currency Of State Licenses For Medical Doctors And Registered Nurses.
For a certificate as medical doctor or professional nurse to remain valid, 46 U.S.C. 7107 requires the holder to keep the state license as medical doctor or registered nurse current. This is the holder's responsibility. There is no need for the expiration date of a certificate of registry to coincide with the expiration date of a state license. The state license must, however, be current when the certificate of registry is renewed.
7. Requirement For Merchant Mariner's Document.
Note that 46 CFR 10.805(b) requires applicants to hold or apply for a merchant mariner's document
8. Temporary Permits.
No temporary letter authorizing employment as a staff officer may be issued without the approval of Commanding Officer, NMC.

B. Licenses For Radio Officers.

1. Statutory Authority.
The authority to grant licenses as radio officer is 46 U.S.C. 7101. Statutory requirements for licenses as radio officer are found in 46 U.S.C. 7103.
2. Application Procedure.
In addition to meeting the standard requirements for all licenses, Regional Examination Centers (RECs) will review the application including all supporting documentation and interview the applicant.

Note: A National Agency check is no longer required to be submitted in the application procedure.

3. Application Approval.
The material listed below must be sent to Commanding Officer, NMC.
 - a. Form CG-719B.
License And Renewal Application (original).
 - b. Form FD-258.
Applicant Fingerprint Forms (2).
 - c. Radiotelegraph Operator License.
Copy (REC should sight original) of applicant's current Federal Communications Commission (FCC) first or second class radiotelegraph operator's certificate.

PART A: MARINER CREDENTIALING
CHAPTER 14: STAFF AND RADIO OFFICERS

- d. GMDSS Operator Certificate.
Copy (REC should sight original) of applicant's current Federal Communications Commission (FCC) GMDSS operator's certificate. This copy is required only when applying for STCW certification or endorsement for GMDSS radio operator. (See 46 CFR 10.205(n).)
 - e. GMDSS Course Completion Certificate.
Copy (REC should sight original) of applicant's completion certificate of a Coast Guard approved course for operator of radio in the GMDSS. This copy is required only when applying for STCW certification or endorsement for GMDSS radio operator.
 - f. Form CG-2765.
U.S. Coast Guard Intelligence Agency Check Request Form is now obsolete and the Intelligence Agency Check is no longer required for radio officers.
4. Currency Of FCC Licenses.
For a radio officer license to remain valid, 46 U.S.C. 7106, and the wording on the license itself, require the holder to keep the FCC license current. This is the holder's responsibility. There is no need for the expiration date of a radio officer license to coincide with the expiration date of the FCC license. The FCC license must, however, be current when the radio officer license is renewed.
 5. Merchant Mariner's Documents (MMDs) For Radio Officers.
Radio officers should be encouraged to apply for MMDs when they receive their licenses. An MMD is required to serve on most vessels that are required to carry a radio officer. Refer to chapter 15 for information on issuing MMDs to radio officers.

N. Surrender Of Merchant Mariner's Documents By Retiring Merchant Mariners.	A15-18

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

A. General Provisions.

1. Authority.

A merchant mariner's document (MMD) issued by an Officer in Charge, Marine Inspection (OCMI) in accordance with 46 U.S.C. 7302 is required aboard those U.S. merchant vessels specified in 46 U.S.C. 8701. These vessels include those at anchor, docked, and loading or unloading passengers or cargo, but not those laid up, dismantled, or out of commission.

2. Seamen's Records.

Records of merchant mariners and vessels have been maintained by the Commandant since 1937. Only those records reflecting activities within the five preceding years are kept at Headquarters; all others are stored at the Federal Records Center in Suitland, MD. Records of merchant mariners who became inactive prior to 1937 are available from the, Judicial, Fiscal and Social Branch, National Archives, Washington, D.C. 20408.

3. Merchant Mariner's Documents (MMDs).

MMD Form CG-2838 replaces previously-issued Certificates of Identification, Certificates of Service, and Certificates of Efficiency. These certificates, no longer acceptable for employment, may be exchanged for current MMDs bearing corresponding endorsements. [NOTE: Holders of able seaman and lifeboatman certificates issued prior to 25 June 1936 must now be treated as original applicants.] An MMD is subject to suspension and revocation (S&R) under 46 U.S.C. 7701 on the same grounds and in the same manner as licenses of officers and Certificates of Registry. An MMD issued to a licensed officer is a certificate of service authorizing the officer to serve in unlicensed capacities, in the department in which licensed (see 46 CFR 12.02-11(c)).

4. Appeals.

Any applicant adversely affected by a decision of or action by the OCMI shall be advised of the appeal procedures contained in 46 CFR 12.02-25.

B. Types Of Transactions.

1. Original Applications.

The new application form shall be used by all applicants for an original MMD.

2. Supplemental Applications.

The new application form shall be used:

- a. When applications are made for qualified ratings requiring evidence of experience or training (see Section 15.E.1 below);
- b. When the seaman's name has been changed (see section 15.F);
- c. When correcting the date and/or place of birth, or describing the evidence establishing citizenship subsequent to issuance of the original document; or

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

When application is made to remove a previously imposed vessel restriction. The applicant's service record, evidence of birth or citizenship, and identification of the surrendered document should be noted on this application. However, such applications should be coordinated with the OCMI responsible for placing the original restriction to determine all fulfilling requirements. Applicants shall be required to document all required service.

3. Additional Endorsements, Exchange, And Replacement Of Documents.

The new application form shall be used by applicants for exchanging and replacing documents, and requesting certain additional endorsements, as follows:

- a. For additional endorsements not requiring proof of sea service or training (see section E of this chapter);
- b. To report the exchange of Continuous Discharge Books (CDBs) for MMDs or vice versa (see section L of this chapter);
- c. For the exchange of MMDs bearing "Z" or "Bk" numbers; and
- d. To report the replacement of mutilated documents (see section 15.K.2).

4. Duplicate Documents.

The new application form shall be used to apply for duplicate MMDs, Continuous Discharge Books (CDBs), and Certificates of Discharge (record of service), (see section 15.K.1), and to request a continuation of a CDB (see section 15.L.3).

5. Renewal Of Documents.

- a. The renewed MMD will be issued for a period of five years from the date of the original application. Mariners who hold a license and an MMD should be encouraged to renew the MMD at the time of license renewal to allow for concurrent renewal dates.
- b. Original and supplemental, MMDs will be issued for a period of five years.
- c. On the application, the word renewal should be shown in the type of transaction section. The expiration date shall be noted in section VIII.

C. Application For An Original MMD.

1. Required Documentation.

No evidence of service is required to obtain entry ratings. The applicant must present proof of a drug test, a social security card, and proof of legal entry into the United States. Evidence of service must be presented to establish an individual's qualifications for qualified ratings. Service on U.S. flag merchant vessels will be documented by certificates of discharge or letters from the employer. Evidence of service aboard foreign merchant marine and military vessels is also acceptable, however, local evaluations shall be made to determine the equivalency of such service to that obtained aboard U.S.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

merchant vessels. For military service, documentation shall be a Transcript of Sea Service from the U.S. Navy, Coast Guard, or Army Transportation Corps, or equivalent documentation providing vessel information, capacity served, and dates aboard each vessel.

Applicants who have been disenrolled from a federal, state, or Great Lakes maritime academy or another Coast Guard approved maritime training center who present evidence of sea service during their training may receive up to six months' credit towards a qualified rating in the department in which the service was obtained. They must present a transcript from the school verifying completion of at least one semester and the amount of sea service obtained.

When the OCMI has issued an MMD to a cadet prior to completion of the lifeboatman requirements, a letter of qualification as lifeboatman may be issued in lieu of an endorsement to the MMD. This letter shall state that the cadet is a qualified lifeboatman and may fill the lifeboatman billets required aboard on the school ship by the COI. If a cadet is disenrolled from the school prior to graduation, but has qualified as a lifeboatman, an MMD for entry ratings may be issued with the lifeboatman endorsement; a letter of commitment from an employer is not required.

2. Required Information.

a. Name.

The applicant's name, as shown on a birth, baptismal, or naturalization certificate, must appear in full. It is common practice for a child to be known by a nickname or derivative of the legal name; as adults, these names tend to stick and few individuals seek court orders to adopt such names. When the name by which the applicant is known is different from that appearing on the documentation of citizenship, certified copies of a court order or other official document such as a marriage license, effecting a change of name must be presented and submitted to the National Maritime Center (NMC-4A) with the new application form. Without a court order, the name on the documentation of citizenship must be used.

b. Address.

A permanent address should be listed rather than a temporary local address. If the applicant's permanent address is outside the U.S., the applicant should furnish the name and address of a U.S. facility, such as an embassy. Such information should be entered in the space entitled "Record of Qualifying Service."

c. Minimum Age Requirements.

No MMD shall be issued to an applicant under 16 years of age. An applicant between 16 and 18 who presents a notarized statement of parental or guardian's consent may be issued an MMD, unless the applicant is disqualified by a reason other than age. When applicable, a statement that such consent has been presented shall be made in the space entitled "Service Record." The notarized statement may be attached with the application.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

d. Complexion.

An entry shall be made that best describes the hue or general color of the applicant's skin, e.g., fair, olive, ruddy, red, yellow, black, or brown. In the last two examples an adjective more closely describing tint may be prefixed: light, medium, or dark. In these instances abbreviations may be used, e.g., LT brown. A common misconception is the complexion description of a light skinned person of color; if applicable in such instances, "fair" may be used to describe complexion.

e. Digital Data Card System.

The "Digital Data Card System" (DDCS) has replaced the need for photographs. Photographs are taken at the REC by the DDCS camera that reproduces the image digitally for placement on the MMD. Photographs are stored in the DDCS system memory and may be reproduced at a later date if/when necessary. Photographs are now needed only when an applicant desires to apply for or renew an MMD by mail. In such cases, submitted photographs are "photographed" and digitally reproduced by and stored in the DDCS. If the applicant is applying by mail, he shall provide two (three, if the REC wants a picture in file) unmounted photos, 2 X 1.5 inches in size, taken within one year of the application. They must show the full face, at least one inch in height, measured from bottom of chin to normal hairline, with head uncovered. Color photographs are acceptable. Polaroid or other "instant" type photographs may be accepted if:

- (1) All photographs submitted do not contain any obvious differences;
- (2) The quality of the photograph is such that the image will remain identifiable for the life of the document; and
- (3) The background to the image on the photograph is plain, flat, and clearly defines the intended image.

f. Citizenship.

Applicants who claim to be citizens of the United States must present acceptable evidence of citizenship (see 46 CFR 12.02-13) at the time of filing the original application. Acceptable evidence of citizenship is listed in 46 CFR 10.205(c), in the order of desirability. [NOTE: 46 CFR 10.205(c), with the exception of paragraphs (c)(1)(ii) and (c)(1)(viii), applies to persons who are native-born; paragraphs (c)(1)(ii) and (c)(1)(viii) apply to naturalized persons.] As birth records have been maintained throughout the U.S. since 1919, affidavits of citizenship shall not be accepted unless an applicant presents evidence of an unsuccessful attempt to obtain a birth certificate. [NOTE: In such cases, affidavits shall be returned to applicants after notation on the application form that they were submitted and copies have been made.] Information in the citizenship section of the application must be (a) USA; (b) another country (specific country) and a resident alien; (c) another country (specific country) and a nonresident alien.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

g. Drug Convictions.

If an applicant indicates drug use or conviction, other criminal convictions, or National Driver Register motor vehicle convictions, refer to Chapter 3 of this volume.

h. License Or Certificate Record.

Particular attention should be given to statements pertaining to the applicant's license or certificate record. Evasive statements on the application, such as "Never previously issued seamen's documents from this office," SHALL NOT be accepted. All previous MMD/license histories shall be listed. All actions under 46 U.S.C. 7701, including voluntary surrenders, shall be indicated. If the application contains a "Yes" answer regarding suspension, revocation, or voluntary surrender of a previously issued MMD, Commandant (G-MOA-2) shall be requested to provide detailed information in the matter.

i. Record Of Qualifying Service.

When a company letter is presented indicating qualifying service, the source, date, type, and amount of service should be entered in the space "Record of Qualifying Service" on the new application form. When the qualifying service is from Certificates of Discharge, indicate "Certificates of Discharge (or computer printout) indicating ____ days of service." There is no need to list each vessel and dates of service. When a Transcript of Sea Service is accepted, the respective spaces shall show branch of service, the names of the vessels, the ratings in which the applicant served, and the complete dates of such service or a certified copy of the Transcript of Sea Service shall be attached to the application form. An additional sheet shall be attached to the application when the information exceeds the allotted space on the form.

j. Section V - Certification And Oath.

This section shall be signed and dated by the applicant. The oath must be administered by authorized Coast Guard personnel. However, when completing a transaction by mail, the oath must be administered and verified by a certified notary public and signed by the applicant. RECs shall ensure that the oath is signed and properly witnessed.

k. Preparation Of Fingerprint Records.

To comply with FBI policy and procedures governing criminal history evaluations, the National Maritime Center (NMC-4A), requires that two classifiable Form FD-258 fingerprint cards be submitted for an original license and certificate of registry and with each application for an original Merchant Mariner's Document. The REC shall submit one card for an original license or certificate of registry and one card attached with one staple in the upper left corner with an application form for a MMD. The second card shall remain at the REC for use if the first card is unclassifiable. Only the two fingerprint cards need to be submitted when the applicant applies for a license and a Merchant Mariner's Document at the same time or within 6 months of a previous application. Particular attention must be given to obtaining legible prints. The majority of rejections are due to one or more fingers not being rolled fully, the

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

charts being smeared as the finger is being removed from the chart, or use of too much or too little ink. Any fingerprint that is smudged or otherwise illegible will be rejected. In addition, the FBI's system will reject any card containing any discrepancy which may include a blank entry or even a middle initial inserted in the place of a full middle name. The Form FD-258 must have the proper ORI code number DCCG 00000, US COAST GUARD, WASH DC. A supply of Form FD-258 with the proper code may be obtained by calling the National Maritime Center (NMC-4A).

(1) Applicant Fingerprint Form, FD-258.

To obtain the needed information for a criminal record check, compliance with the instructions on the back of Form FD-258 is essential. Personnel must ensure that the following information is provided.

- (a) Applicant's Name. (First, Middle, Last, Suffix)
- (b) Social Security Number.
- (c) Date of Birth.
- (d) Place of Birth.
- (e) REC Location. The space entitled "Employer and Address" should contain the name and address of the Regional Examination Center where the application is submitted.
- (f) Reason For Fingerprinting. The reason for fingerprinting (original license, license as radio officer, certificate of registry as staff officer or MMD) must be typed or legibly printed in the space designated "Reason Fingerprinted."
- (g) Race. The space for "Race" will be completed with one of the following abbreviations only:

American Indian (AI); Alaskan Native (AN);

Asian (A); Pacific Islander (PI);

Black (B); Hispanic (H); or,

White (W).

(2) Authenticity Of Information.

If for any reason you doubt the information provided by the applicant, the case shall be referred to the National Maritime Center (NMC-4A) for decision, with a letter stating the basis for doubt (including all pertinent details and justification).

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

(3) Radio Officers.

When an applicant has been approved for a license as radio officer and subsequently, within the five year renewal period, applies for an original MMD endorsed "See License as Radio Officer", a second set of fingerprints need not be obtained or submitted to the Commandant.

l. Caution Against Fraudulent Applications.

An application not completed truthfully should be considered fraudulent, and any license or MMD initially issued under such an application should be voided ab initio (as if never issued; see Commandant Decision on Appeal 2025). All applicants shall be advised of the penalties for making false statements on an application form (see 18 U.S.C. 1001). Failure of the applicant to answer questions on the application may cause considerable delay in processing and issuing the document, and the applicant shall be so informed. Items not applicable should be noted by "N/A" or "None," as appropriate. When a fraudulent application is discovered the applicant shall be notified that any initial document thereby issued is "null and void" and be directed to immediately return it to the OCMI. A document that has been re-issued based on a fraudulent application cannot be declared "null and void." In these cases the documented person must be charged and taken to a hearing. These cases shall be reported to the Senior Investigating Officer (SIO). See chapter 3 of this manual.

(1) Fraudulent MMD Returned.

If the MMD is returned it shall be canceled.

(2) Fraudulent MMD Not Returned.

If the applicant refuses to return the MMD after receiving notification, the applicant's file should be forwarded to the unit's SIO for further action. An investigating officer will then determine if the case warrants filing charges against the individual with the U.S. Attorney. The OCMI should develop a working relationship with the U.S. Attorney to determine what cases should be criminally pursued and what type of documentation should be submitted. The investigating officer should make every effort to recover the certificate regardless of whether criminal charges are pursued.

m. Drug Tests.

When drug tests are required at the time of the application, the applicant shall provide proof of a test within the previous six months or of being subject to a random drug testing program for at least 60 days within the previous 185 days. Tests must be conducted by laboratories certified by the Substance Abuse and Mental Health Services Administration (SAMSA, HHS), an agency of the Department of Health and Human Services. See section 1.G.5. of this volume for more information on drug tests.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

n. National Driver's Register (NDR) Authorization Forms.

46 U.S.C. 7505, requires all applicants for merchant mariner credentials to sign a consent form giving the Coast Guard the authority to obtain a check on the mariner from the National Driver Register (NDR). This form has been incorporated into the application (CG-719B) and RECs shall ensure section 9 is filled out on the application.

3. Additional Requirements For Aliens Seeking Original MMDs.

a. General Requirements.

In addition to meeting all other requirements for original MMD applications, each alien must furnish the information listed in the following paragraphs. Applications from aliens may be accepted and processed at the REC, and original documents issued, without prior Headquarters approval. An alien is a non-U.S. citizen by birth.

b. Evidence Of Legal Entry/SSN.

Alien applicants for original MMDs are required to present evidence of lawful admission to the United States for permanent residence or for employment. This evidence may be an alien registration card issued by the Immigration and Naturalization Service (INS) or a passport entry visa or notation. The evidence should be carefully examined and, when questionable, authenticity verified with INS authorities. As with all applicants, each alien must present a social security card. This requirement is to assign a seaman identification number and establish a computerized mariner's record. In instances where social security cards are stamped "Employment Not Authorized," as in the case of certain nonresident aliens, a document may still be issued. Possession of a merchant mariner's document is not an implied right to employment. Responsibility for employing nonresident aliens, as with other document holders, lies with the employer. Illegal employment is monitored by the Social Security Administration and the Immigration and Naturalization Service.

c. Special Entries On Application Forms.

The evidence of lawful admission to the United States shall be cited on the application in the citizenship section. When the applicant is being processed for permanent residency, an entry to this effect, with the appropriate registration number or passport citation, shall be made on the application.

d. Questionnaire for National Security Positions SF-86 (formally, Coast Guard Intelligence Agency Check Request, Form CG-2765.

Form SF-86, Questionnaire for National Security Positions, replaces the previous form CG-2765. The form SF-86 must be executed for all non-U.S. citizens born outside the U.S., attached to the application and fingerprint forms, and forwarded to Commanding Officer, National Maritime Center. The NMC will forward the completed SF-86 to Immigration and Naturalization Service for processing and verification of an aliens's legal entry into the U.S. Form SF-86 is available on Form Filler. Paper copies may be ordered from regular supply sources.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

The applicant must complete Parts 1-14 (page #s 1-5), and sign the bottom of page 9. In addition, page 10 (Authorization For Release Of Information), must also be completed and signed.

D. Temporary Certificate Of Identification, Form CG-2838(T).

Effective 15 November 1992, the Temporary Certificate of Identification, Form CG-2838(T) (TMMD), will not be issued for entry ratings. Applicants for an original MMD, shall be issued Form CG-2838 if they meet all the requirements, e.g., proof of service when needed, social security card, proof of citizenship or legal entry, drug tests, physicals and examinations where required.

1. When To Issue.

The Temporary Certificate of Identification, Form CG-2838(T), may be issued in the following situations:

- a. When a mariner has lost the U.S. Merchant Mariner's Document, needs to report for work within 48 hours, and the National Maritime Center (NMC-4A) cannot verify the ratings and duplicate number.
 - (1) The mariner must appear at the REC and complete the application, for a duplicate document and pay the appropriate fee for duplicate MMD.
 - (2) The REC shall call the National Maritime Center (NMC-4A) for verification. If NMC-4A can not verify the ratings and duplicate number, the applicant may be issued a Temporary Certificate of Identification with entry ratings. For a rating other than entry ratings, the applicant must provide proof of the rating held. The proof should be in the form of certificates of discharge or an equally valid form of documentation which satisfies the local OCMI.
- b. In special cases the OCMI may determine that a Temporary Certificate of Identification (TMMD) is needed. Commandant (NMC-4A) shall be notified of the circumstances and duration of the Temporary Certificate of Identification. If the determination is for a specific group, the National Maritime Center (NMC-4A) shall be consulted prior to issuing the temporary certificate.

2. Prefix "T".

The prefix "T" precedes the applicant's social security number (SSN) in the block for "MMD No.";

3. Temporary Certificate Of Identification.

The Temporary Certificate of Identification shall be valid for the term of the voyage or six months from issue date, whichever is longer. In special cases, the period of validity shall be established by the OCMI and the National Maritime Center (NMC-4A) advised of the term.

4. Impression Seal.

An impression seal shall be used to emboss parts of the mariner's signature and photograph.

5. Instructions For Filling Out Form CG-2838(T).

In cases where Temporary Certificate of Identification, Form CG-2838(T) are issued, the following instructions should be used:

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

- a. The applicant shall execute an Application for Original, Supplemental, or Duplicate Merchant Mariner's Document, ensuring that all sections of the application are completed.
 - b. The applicant should ensure that the application indicates that a Temporary Certificate of Identification (TMMD) was issued, the reason for the TMMD, and the expiration date is shown in block #46.
 - c. A photograph shall be attached to the TMMD and to the application form. Extra photographs shall be returned to the mariner for later use.
 - d. The original application with the photograph shall be forwarded to the National Maritime Center (NMC-4A), and a copy shall be maintained at the REC.
- E. Application For Additional Endorsements.
1. Endorsements For Higher Ratings.
The new application form shall be filed when an applicant is applying for an unlicensed rating higher than the presently held rating and the higher rating requires presentation of evidence of qualifying service. All additional qualifying service shall be specified on the form. These transactions normally require a physical, drug test, and professional examinations. Reports of Physical Examination shall be forwarded with this form.
 2. Additional Qualified Member Of The Engineering Department (QMED) Or Unqualified Ratings.
Additional endorsements of MMDs for ratings not requiring qualifying experience, or for additional QMED ratings, shall be reported in Section VIII of the new application form, which is forwarded to the National Maritime Center (NMC-4A).
 3. Additional Endorsements Not Requiring Professional Examinations.
Documents with entry ratings which are surrendered for additional unqualified ratings not requiring professional examination shall be reissued and endorsed with the additional ratings upon filing of the application form.
 4. Affirmation Of Narcotics Involvement.
If the applicant affirms any narcotics convictions, other criminal or NDR convictions, a local evaluation of the applicant's eligibility shall be made to determine whether action under 46 U.S.C. 7704 is warranted. REC personnel should check the Coast Guard Wanted/Locator list to determine if the applicant appears on the list. If the applicant's name appears on the list, the local Investigating Officer should be contacted. An MMD shall not be issued until the applicant has provided satisfactory evidence that he or she is no longer involved with narcotics or any criminal activity. If a conviction has occurred since the document was issued, the evaluation shall follow the guidelines set forth for an original document, see section 3.A.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

F. Change Of Name.

If a mariner requests a new MMD due to a legal change of name, the mariner shall be required to submit a supplemental application, with a certified copy of the evidence of the new legal name, e.g., court order, certificate of marriage. The application should show the new name followed by the previous name in parentheses. The mariner shall then be issued an MMD showing the new legal name. If a "Z" or "Bk" number appears on the old document it shall be replaced with the applicant's SSN at that time. The application shall be forwarded to the National Maritime Center (NMC-4A); the old document shall be destroyed at the REC.

G. "Z" And "Book" Numbers.

"Z" and "Book" numbers were control numbers issued by Commandant (G-MVP-1) from 1937 until 1978. They required an authorization from G-MVP-1 for each MMD/CDB issued. In 1978, the Coast Guard began using the mariner's social security number as their identification. The mariner's social security number must appear on the MMD. No other identifying numbers such as "Z" or "Book" number shall appear on the MMD.

H. Requests For MMDs From Other Agencies.

To maintain necessary central records and administrative control, RECs receiving requests for issuance of MMDs for special official purposes shall refer them to the National Maritime Center (NMC-4A). Requesting agencies shall be advised to route such requests directly to the National Maritime Center (NMC-4A), stating the reason(s) for such requests. In cases where time concerns are pressing, telephone requests may be approved by the National Maritime Center (NMC-4A), with follow-up letters to be forwarded.

I. Issuance Of MMDs To Employees Of The National Oceanic And Atmospheric Administration (NOAA).

1. General.

Applications for MMDs endorsed in entry or qualified ratings may be accepted from NOAA employees. If the applicant is in all respects qualified for the endorsement requested, the approved document shall not be limited to NOAA vessels. However, if the applicant fails to meet the general requirements for the endorsement, service and examination requirements may be tailored to service aboard NOAA vessels. In such cases, the MMD issued shall be endorsed "Valid for use aboard NOAA vessels only." Except as modified by this subpart, all usual procedures shall be followed in issuing MMDs so restricted.

2. Evidence Of Service.

A letter from a NOAA vessel's commanding officer or a NOAA district officer shall be accepted as documentation of service. If the qualifying service for a QMED endorsement has been obtained aboard vessels of more than 100 gross tons (GT), and at least 75 percent of that time has been obtained aboard vessels in underway operations, the MMD should not be limited to NOAA vessels, if the applicant is qualified for an unrestricted document in all other respects.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

J. Permanent MMD, Form CG-2838.

All applicants may be issued a permanent MMD at the time of application without prior Headquarters approval. Applicants shall execute the application form generated by the Merchant Mariner Licensing and Documentation (MMLD) system. The issuing officer shall determine whether this application will suffice for permanent record purposes. The evidence of sea service presented shall be noted on the application and returned to the applicant. Upon issuance of the MMD, the applicant's complete record (along with the Form FD-258, and Form CG-2765 if the applicant is an alien) shall be forwarded to the National Maritime Center (NMC-4A). A copy of the application shall be retained by the issuing REC.

K. Duplicate, Mutilated, And Replacement Documents.

1. Duplicate Merchant Mariner's Documents.

a. Duplicate Document For Entry Rating.

If a merchant mariner's document (MMD) is lost and the mariner needs it for immediate employment and the National Maritime Center (NMC-4A) cannot verify by phone, a duplicate MMD may be issued on Form CG-2838(T), provided that an application form has been filed. A check should be made of the "Seamen Wanted" List and the local investigation department's wanted list.

b. Duplicate Document For Qualified Ratings.

Unless there is an immediate need for the MMD, the application shall be forwarded to the National Maritime Center (NMC-4A) for approval. If a mariner needs a duplicate MMD for immediate employment, REC personnel shall contact the National Maritime Center (NMC-4A) by phone for verification of ratings and duplicate number. Phone verifications shall be requested only if the need is important enough for the mariner to be in the office at the time of the request or to have made an appointment to appear within 24 hours of the request. The mariner should also be prepared to show an immediate need for the duplicate MMD. In cases of immediate need, if the National Maritime Center (NMC-4A) cannot verify the rating the same day of the request, shipping articles, payroll slips, or similar records indicating the ratings that the mariner worked may be used to verify the rating for the MMD. If satisfactory evidence cannot be obtained, the document must not be issued. Before issuing a duplicate MMD, the following actions shall be taken:

- (1) Check the Seaman's Locator/Wanted list.
- (2) Contact Commandant (G-MOA-2) for any pertinent information concerning affirmed suspensions, revocations, or voluntary surrender of an MMD before issuing the duplicate MMD.
- (3) Obtain satisfactory evidence of no further involvement with narcotics if use or addiction of narcotics is affirmed.
- (4) Issue MMD but initiate an investigation to determine if action under 46 U.S.C. 7704 is warranted when a narcotics conviction is affirmed.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

c. Application For Duplicate Documents.

(1) Use Of Application Form.

All applications for duplicates of MMDs, Continuous Discharge Books (CDBs), and certificates of discharge (records of service) shall be made in duplicate using an application form. The application shall be forwarded to the National Maritime Center (NMC-4A), which will provide the required information and return the application to the Regional Examination Center (REC) to issue the document.

(2) Preparation Of The Form.

All applicable items on the form shall be filled in before the form is accepted. The port (REC) shall be entered in block 1. The applicant's name must appear in full and the applicant's Social Security number (SSN), and the "Z" or "Bk" number, shall be included to aid identification. No application shall be accepted without a United States SSN. The name must be exactly the same as that under which the applicant was previously documented. [NOTE: Particular care should be taken that Hispanic applicants do not transpose their middle and last names.] The applicant's permanent address should be listed, rather than a temporary local one. Present or Previous MMD/License History shall include all MMD or license transactions, including a temporary MMD, which the mariner has had during his/her career as a merchant mariner. Section V, Request for Duplicate License, MMD, or CD, Block 37-39 shall have the license serial/MMD number, date of issue, and port (REC) of issue of the lost document. The time, manner and place of loss, and a summary of recovery efforts shall be shown in section V, block 42. The applicant must sign and date the application.

(3) Yes And No Questions.

All "yes" and "no" questions in section II, block 24 and section VI, must be answered and initialed by the mariner. The mariner shall be advised, either in written or verbal form, of the possible consequences of a false answer. When the document is issued section VI shall be completed indicating the expiration date, ratings issued, date and signature of the issuing official and port (REC) where issued.

(4) Photographs.

All applicants for duplicate MMDs or CDBs may apply in person at the REC or, if applying by mail, send in two photos of the type previously described. Photographs are then digitally reproduced and stored in the DDCS memory. The application is then forwarded to the National Maritime Center (NMC-4A) for approval. If the application is for a CDB or the applicant has requested that the duplicate MMD be issued at another REC, both photos shall be forwarded to the National Maritime Center (NMC-4A).

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

(5) Collection Of Fees.

In case of the loss of an MMD or CDB by shipwreck or other marine casualty, the seaman shall be supplied a duplicate without cost as specified in 46 U.S.C. 7501(a). All discharge data available from Coast Guard records will be entered into the CDB. In all other instances of loss, the Coast Guard, under 46 U.S.C. 7501(b) and 10311(d)(2), may issue duplicate merchant mariner's documents, Certificates of Discharge and CDBs upon payment to the government of service charges for processing them. The fee currently prescribed for issuance of duplicate merchant mariner's documents and Certificates of Discharge, Form CG-718A, and CDBs by 46 CFR 12.02-18 shall be collected at the time of application.

d. Preparation Of Duplicate Documents.

(1) Identification Number.

All duplicate MMDs shall contain the applicant's SSN in lieu of any "Z" or "Bk" number previously assigned. No prefix should be attached to this number. Duplicates shall be given a suffix ("D1," "D2," etc.) after the SSN only in the space designated "Z or Bk Number."

(2) Questions Of Birth Or Citizenship.

Duplicate MMDs shall NOT be issued with question marks entered in the spaces for place of birth and citizenship. In cases of doubt, applicants must present the necessary evidence of citizenship to be issued a duplicate document. If an applicant presents evidence of an unsuccessful attempt to obtain a birth certificate, and cannot present evidence of citizenship in any of the forms prescribed in 46 CFR 10.02-5(c), the document shall indicate the place of birth and citizenship claimed by the applicant. If the date of birth cannot be proven, the REC shall issue the MMD with dashes inserted in that space; the applicant's claim shall not be accepted.

(3) Endorsements On Duplicate MMDs.

The endorsement on a duplicate MMD shall reflect current terminology. All superfluous ratings shall be eliminated unless the applicant requests otherwise (this request may be made orally).

e. Issuance Of Duplicate Merchant Mariner's Documents.

(1) By Mail.

Duplicate MMDs may be mailed to applicants at their request. Duplicate Certificates of discharge may be mailed via regular mail if no additional fee is to be collected.

(2) By Another REC.

When a duplicate MMD is requested to be issued at an REC other than the one at which the application was made, both copies of the application form shall be forwarded to the National Maritime Center (NMC-4A), with the required photograph(s). A notation shall be made on the application that the applicant desires the document be issued at a REC other than where the application is initiated. The NMC will return the application containing the information necessary for preparing the MMD to the REC requested to issue the document.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

(3) Reporting Requirements.

The original application for all duplicate MMDs and Certificates of Seamen's Service issued shall be returned to the National Maritime Center (NMC-4A) after entering the issuing information required in Section VI. If duplicate documents are mailed, the issue date shall be the date of mailing. The original application should not be sent to the National Maritime Center (NMC-4A) until the document is mailed or delivered to the applicant. The ratings, date of issue and signature of the issuing official shall be shown.

(4) Warnings Regarding Loss Of Documents.

When duplicate MMDs are issued, the holder shall be warned of the gravity of losing the original. The holder should also be informed that the lost document is no longer valid and should be returned to the Coast Guard if subsequently recovered.

(5) Recovery Of Lost Documents.

Documents that have been lost and subsequently turned in to the Coast Guard shall be held for 30 days. If not claimed in that time, they shall be destroyed and the National Maritime Center (NMC-4A) so advised by rapidraft or E-mail.

(6) Disposition Of Un-issued Duplicate Documents.

When duplicate MMDs, CDBs, and Certificates of Discharge are not issued within six months of preparation, attach the un-issued document to the original application and return them to the National Maritime Center (NMC-4A) with a notation that they were retained for six months at the REC and include the dates of attempts to contact the applicant to arrange for issuing documents.

2. Mutilated Documents.

a. Replacement By The OCMI.

If a mutilated MMD identifies the holder, all data is distinguishable and shows no evidence of alteration, a new MMD shall be prepared and delivered without charge (the replacement shall update all incorrect information). A record of this exchange shall be forwarded to the National Maritime Center (NMC-4A) on an application form. Sections I, II, VI, and VII shall be completed insuring ratings, date of issue and signature of the issuing official are included.

b. Data Unidentifiable Or Altered.

If the data on a mutilated MMD cannot be distinguished or the holder cannot be identified, the transaction shall be treated as a lost document, and the original shall be destroyed locally. If data on an MMD shows evidence of alteration, the investigations office should be contacted and appropriate actions taken.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

3. Replacements For Other Transactions.

When a mutilated MMD is surrendered for an additional endorsement, change of name, etc., the transaction should be completed as appropriate and the surrendered document destroyed locally. A notation shall be made on the application that the old document has been locally destroyed.

L. Continuous Discharge Books (CDBs).

1. Issuance Of CDBs.

With certain exceptions, all merchant mariners sailing on vessels of over 100 gross tons for foreign voyages and 75 gross tons for coastwise voyages must be issued a Merchant Mariner's Document. If an applicant insists on receiving an original CDB, an application shall be completed with the appropriate box checked. The REC will prepare and issue the CDB in the same manner as a MMD.

2. Exchange Of CDBs For MMDs.

An applicant seeking to exchange a CDB for an MMD (Form CG-2838) may do so at any time. All MMDs shall bear the applicant's SSN, instead of any "Z" or "Bk" number previously held. A report of such an exchange shall be made to the National Maritime Center (NMC-4A) on an application form; a notation will be made on the application that the applicant held a prior document bearing a "Z" or "Book" number. The CDB shall be returned to the mariner as a record of service.

3. Continuation Of CDB.

A mariner possessing a CDB in which all but three or fewer spaces are used may submit the new application form for a continuation book. The appropriate portions of this form will be executed and the original forwarded to the National Maritime Center (NMC-4A). A continuation of the CDB, showing the mariner's SSN, will be issued by the REC without charge.

M. Merchant Mariner's Document (MMD) Forms.

1. Preparation Of Documents.

MMDs are now prepared with the computerized DDCS system using form CG-2838. If an item called for on the MMD form is not applicable, N/A, or NONE should be entered in the space.

a. Name.

The MMD shall be issued according to the name shown on the application which must be the legal name shown on a birth certificate, court order, or marriage license.

b. Social Security Number (SSN).

The applicant's SSN shall appear in the space for "SSN" on the front of the MMD. All original, supplemental, renewal, and duplicate documents shall bear the SSN. An MMD shall not be issued until a Social Security card, receipt of Social Security card, or a signed document from Social Security Administration showing application for duplicate Social Security number has been shown to the REC personnel.

c. Place Of Birth.

If native-born, enter the state in which the applicant was born. If not native born, enter country of birth.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

- d. Citizenship.
Enter the name of the country of which the applicant is a citizen. Acceptable evidence of citizenship must be shown before the document is issued. For nonresident aliens, the notation "NRA" must be placed immediately following this notation. If a determination of citizenship cannot be made, contact the local Immigration and Naturalization Service (INS) for assistance. If INS is unable to make a determination, the citizenship block should read "NON-US" or "NON-US-NRA" (NRA = Non Resident Alien).
- e. Address.
The permanent address shown on the application shall be used.
- f. Signature.
Applicants shall sign their full first name, middle initial, and last name, and any suffix such as Jr., III, in ink.
- g. Complexion.
The applicant's complexion shall be stated as recorded on the application (see section C.2.d of this chapter).
- h. Issued By.
Enter the REC issuing the document.
- i. Location Of Expiration Date.
The expiration date shall be placed on the face of the MMD, beneath the mariner's picture and on the back of the MMD beneath the thumb print.
- j. Signature Of Issuing Official.
The issuing official shall sign directly above the line labeled "Examiner" being careful not to obscure the endorsements. "By direction of OCMI" appears beneath the name of the "Examiner".
- k. Endorsements.
The rating endorsement(s) for which the applicant is qualified shall appear on the reverse of the permanent document beneath the physical description data line. Endorsements must clearly state the qualifications of the holder.
- (1) Entry Ratings.
All MMDs issued for entry ratings shall be endorsed for Ordinary Seaman, Wiper, and Steward's Department (FH). No other entry rating endorsement shall be issued, except as provided in section 15.M.1.k.(4)(a) and (b) below. All entry ratings shall be endorsed on an MMD except when a higher rating for a department is warranted by service and testing. A physical is no longer required for food handlers.

PART A: MARINER CREDENTIALING
CHAPTER 15: DOCUMENTING U.S. MERCHANT MARINERS

(2) Ratings In Several Departments.

If an MMD applicant is qualified to serve in more than one department, the ratings for which the applicant is qualified in each department will be endorsed separately. For example, a fireman/watertender who is also qualified as a lifeboatman and in the Steward's Department (FH) will have the MMD endorsed, "Fireman/Watertender, Lifeboatman, Ordinary Seaman, Steward's Department (FH)." QMED will be used only when the applicant is qualified for all QMED ratings.

(3) Endorsements For Licensed Or Staff Officers.

An MMD issued to a licensed officer or staff officer shall be endorsed with entry ratings and in accordance with 46 CFR 12.02-11.

(4) Marine Training Program Endorsements.

Special endorsements shall be issued to students engaged in training programs that include an institution-sponsored sea period. Students at institutions that do not provide a sponsored sea period, and where the students must seek employment on their own, entry-level endorsements shall be issued. Should doubt arise as to a specific endorsement, the approval letter for the particular institution should be consulted. Cadet (Deck) or Cadet (Engine) endorsement(s) shall be issued, in accordance with 46 CFR 12.25-25, to cadets enrolled at the U.S. Merchant Marine Academy; those cadets involved in the Dual Licensing Program shall receive both endorsements. Cadets at state academies generally do not require MMDs, as their sea training is normally conducted on state operated training ships. Should issuance of MMDs to such cadets become desirable or necessary, the foregoing endorsements (as appropriate) shall be used.

(a) "Student Observer-Any Department" endorsements shall be issued, in accordance with 46 CFR 12.25-30, to students enrolled in programs dealing with marine management, operations, naval architecture, oceanography, and similar subjects.

(b) Apprentice mate or engineer endorsements shall be issued, in accordance with 46 CFR 12.25-35 and -40, to students enrolled in approved training programs, other than at federal or state academies, that lead to issuance of deck or engineer licenses.

N. Surrender Of Merchant Mariner's Documents By Retiring Merchant Mariners.

Several maritime labor organizations require pension applicants to surrender their merchant mariner's document as a condition for receiving benefits. This practice is precluded by 46 U.S.C. 7303 which requires each document be retained by the mariner to whom it is issued. However, in an effort to assist mariners in obtaining their entitlements while preventing any violation of law, the REC should accept the document for deposit. A receipt on letterhead, or a locally approved form, should be given to the mariner. The mariner should be advised that upon request the document will be returned only to the mariner with or without receipt. The document may be held locally or sent to the National Maritime Center (NMC-4A) with a copy of the receipt to be filed in the mariner's official record.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS**

- | | |
|---|-------|
| 5. Endorsement For Designated Duty Engineers (DDEs) | A16-6 |
| G. Tankerman Ratings | A16-6 |

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS****A. Introduction.**

To provide a reasonable degree of safety in the operation of a vessel, certain members of the crew must be qualified to steer the vessel, maintain an efficient lookout, handle the lifeboats, operate the main propulsion plant and necessary auxiliaries, etc. The pertinent statutes are as follows:

- | | | |
|----|------------------------------|--|
| 1 | 46 U.S.C. 7306 through 7311a | Able seaman (AB); |
| 2 | 46 U.S.C. 7313 and 7314 | Qualified member of the engineering department (QMED); |
| 3. | 46 U.S.C. 7316 | Lifeboatman; and |
| 4. | 46 U.S.C. 7317 | Tankerman. |

B. Physical Examinations For Qualified Ratings.

Form CG-719K, Merchant Marine Personnel Physical Examination Form, shall be used when applicants for AB, tankerman, or QMED ratings receive physical examinations. The results of the examination and any approved waivers shall be forwarded to Headquarters along with the form CG-719B.

C. Able Seaman (AB) Ratings.**1. Able Seaman Endorsements.**

Only the following endorsements for an AB should be entered on merchant mariner's documents (MMDs):

- a. Able Seaman-Unlimited;
- b. Able Seaman-Limited;
- c. Able Seaman-Special;
- d. Able Seaman-Offshore Supply Vessels;
- e. Able Seaman-Fishing Industry;
- f. Able Seaman-Sail; and
- g. Able Seaman-Mobile Offshore Units.

See 46 CFR 12.05-7(c) and (d) for conversion of prior endorsements to those indicated above.

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS**2. Minimum Service.

An applicant needs the following minimum service to qualify for the various categories of able seaman:

- a. Able Seaman-Unlimited. Three years service on deck of vessels operating on the oceans or the Great Lakes;
- b. Able Seaman-Limited. Eighteen months service on deck of vessels of 100 gross tons or over which operate on the oceans, Great Lakes, or navigable waters of the United States;
- c. Able Seaman-Special. Twelve months service on deck on vessels operating on the oceans, Great Lakes or the navigable waters of the United States;
- d. Able Seaman-OSV. Six months service on deck on vessels operating on the oceans, Great Lakes, or the navigable waters of the United States.

3. Character Of Qualifying Service.a. Background.

The sea service requirements for the able seaman ratings are set forth in 46 U.S.C. 7307 through 7311a. The source statute as recodified in 1983 was 46 U.S.C. 672. Originally, that statute provided for three types of able seaman ratings. The service required for what are now AB-Unlimited and AB-Limited had to be on vessels of 100 gross tons or more. In 1980, Congress modified the statute to, among other things, provide an orderly ladder of advancement based on experience levels. It created the current AB ratings and specified the required sea service to qualify for each. It eliminated the minimum vessel size requirement for qualifying sea service toward AB-Unlimited. It specified that the service must be service on deck and it defined "service on deck."

b. Service On Deck.

Qualifying service for all able seaman ratings except Able Seaman-MOU must be service on deck. Under 46 U.S.C. 7301, service on deck is "service in the deck department in work related to the work usually performed on board vessels by able seamen and may include service on fishing, fish processing, fish tender vessels and on public vessels of the United States." The intent of this requirement is to advance individuals to the rating of AB based on their familiarity with the various duties and tasks performed under that rating. The applicant's experience shall be reviewed to ensure that the basic experience is within these statutory guidelines. Although there is no minimum vessel size specified, evaluators should keep in mind the duties of an able seaman when evaluating sea service to determine if it can be considered "service on deck." [NOTE: Pub.L. 101-595, Title VI, 602(e)(3), Nov. 16, 1990, noted under 46 U.S.C. 7306, requires that any service that was used to qualify for Able Seaman-

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS**

Fishing Industry shall be accepted for Able Seaman-Special or Unlimited. For Able Seaman-Limited, that service shall be accepted provided it was on board vessels of at least 100 gross tons.]

4. Service As A Maintenance-Person.

Time served in the maintenance department of a vessel, where a maintenance department is allowed by the vessel's COI, is considered 50% deck service and 50% engine service, unless the certificate of discharge specifies otherwise. The portion of service on deck may be credited toward required service for AB.

5. Qualifying Service On Mobile Offshore Units.

Experience in the deck department of a mobile offshore unit (MOU) is creditable toward able seaman endorsements even if the rig is temporarily bottom bearing. The following are considered deck department positions: roustabouts, roughneck, tool pusher, rig superintendent, driller, derrickman, and crane operator. In some cases a barge engineer on a moveable rig is part of the deck department. Companies must be contacted and a letter provided verifying the applicant's deck department service in each case. Welders are not part of the deck department and their service is not qualifying for AB.

6. Qualifying Service On Fixed Platforms.

Experience gained on fixed structures may substitute for up to one third of the service requirement for any able seaman rating provided that:

- a. The structure is equipped with Coast Guard approved lifeboats/survival capsules;
- b. The applicant shows evidence of having been trained in the use and maintenance of that equipment; and
- c. All regular drills are held on the structure as evidenced in the company log.

7. Examinations.

Applicants for an AB-OSV endorsement must be examined with the proper examination for that endorsement. Previous policy allowing applicants to test with the AB-Unlimited examination, then qualify as lifeboatman and present only sea service for the AB-Unlimited endorsement, is canceled. The nature of the examinations are different because the AB-OSV exam includes numerous questions on lifesaving not included in the AB-Unlimited exam. Previous applicants for AB-OSV who passed the AB-Unlimited exam may receive the AB Special, Limited or Unlimited endorsement until March 25, 2000 in accordance with the policy in effect at the time of testing. RECs should give this new policy widespread publicity.

8. Able Seaman-Fishing Industry.

An individual may be rated as Able Seaman-Fishing Industry if the individual has at least 6 months service on deck on board vessels operating on the oceans or the navigable waters of the United States (including the Great Lakes). The endorsement Able Seaman-Fishing Industry permits the holder to serve as AB only on fish processing vessels.

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS**9. Able Seaman-Sail.

An individual may be rated as Able Seaman-Sail if the individual has at least 6 months service on deck on sailing school vessels, oceanographic research vessels powered primarily by sail, or equivalent sailing vessels operating on the oceans or navigable waters of the United States (including the Great Lakes). The endorsement permits the holder to serve as AB only on sailing school vessels.

10. Able Seaman-MOU.

The regulations do not specify an endorsement as Able Seaman-MOU, but the Coast Guard instituted the endorsement in response to industry needs. Mobile offshore units (MOUs) include non-self-propelled and self-propelled mobile offshore units while under tow or at the exploration or exploitation site operating exclusively in mineral and oil exploration and exploitation. This includes drilling, accommodation, construction, maintenance, pipelaying and firefighting vessels. It does not include supply and towing vessels. The general requirements of 46 CFR 12.01 and 12.02 apply.

a. General Requirements For Able Seaman-MOU.

Applicants must be at least eighteen years of age, speak and understand the English language as required to perform able seaman and emergency duties, and meet the same physical standards that apply to the other able seaman endorsements. Able Seaman-MOU may only serve as AB on mobile offshore units.

b. Service Requirements For Able Seaman-MOU.

Applicants must have twelve months service (360 eight-hour days) on vessels of at least 65 feet or more on ocean, coastwise or inland routes. A U.S. Coast Guard approved training program may substitute for up to one third of the service. Such a course should include realistic survival craft and survival equipment training.

c. Examination(s) For Able Seaman-MOU.

Applicants must pass the examination for Able Seaman-MOU. Applicants must also complete the practical and written examination for either lifeboatman or lifeboatman-MOU prior to obtaining an Able Seaman-MOU endorsement.

11. Ratings As Boatswain, Etc.

The provisions of 46 CFR 12.05-11 automatically provide that the holder of an MMD endorsed as AB need not obtain an additional endorsement to serve as any unlicensed rating such as boatswain (the leading seaman and immediate supervisor of unlicensed deck personnel who supervises the maintenance of deck gear), etc. The rating of boatswain may be issued to an applicant who qualifies for the rating of AB in both experience and professional knowledge, but has defective vision or color blindness. [NOTE: Such a rating should only be issued if the applicant has at least 3 years of qualifying service and passes the required professional examination].

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS**12. Able Seaman Endorsements For Licensed Deck Officers.

When deck officers qualify for an endorsement as able seaman they will be tested as follows:

License Held	AB Written	LB Written	AB Practical	LB Practical
Master/Mate 0 - 1600 GT	X	X	X	X
Master/Mate Any GT	None	None	None	X
Pilot	X	X	X	X
Operator	X	X	X	X

13. Service By Able Seaman - OSV.

46 U.S.C. 7310 is not specific as to the type of vessels that may employ an Able Seaman-OSV. It only says the vessels must be less than 500 gross tons and support exploration, exploitation or production of offshore mineral or energy resources. Therefore, an Able Seaman-OSV may be employed aboard any such vessel, including an uninspected towing vessel, involved in this industry.

D. Lifeboatman Rating.1. Qualification Requirements.

In order to qualify for the endorsement of lifeboatman, the applicant must produce documentary evidence of at least one of the requirements stated in 46 CFR 12.10-3. No certificate of efficiency as lifeboatman is required of any person employed on any unrigged vessel, except on a seagoing barge and on a tank barge navigating waters other than rivers and/or canals. For the purpose of this section, an unrigged vessel is a barge which is not self-propelled.

2. Practical Demonstration Of Skills.

In accordance with 46 CFR 12.10-5, candidates must successfully complete the written part of the examination and demonstrate their ability to serve as lifeboatman. Chapter 5 contains guidance on administering the practical examination.

3. Able Seaman Ratings That Include Lifeboatman Certification.

MMDs endorsed as able seaman (either unlimited, limited or special) need not carry a separate lifeboatman endorsement since these able seaman endorsements include certification as lifeboatman. However, mariner's that qualify for the lifeboatman endorsement should carry it on their MMD if they hold Able Seaman OSV, Sail or Fishing Industry since those ratings do not include certification as lifeboatman. They do include certification as lifeboatman limited to vessels to which the able seaman endorsement applies. [EXAMPLES: AB-OSV is a lifeboatman on OSVs; AB-Fishing Industry is a lifeboatman on fish processing vessels.]

E. Lifeboatman-MOU Rating.

This endorsement no longer exists. See Able Seaman-MOU on page 4 of this chapter for clarification.

PART A: MARINER CREDENTIALING**CHAPTER 16: QUALIFIED RATINGS FOR MERCHANT MARINER'S DOCUMENTS****F. QMED Ratings.**

A qualified member of the engine department is any person who holds an engine department rating issued by the U.S. Coast Guard that is below licensed officer and above wiper.

1. Sea Service.

An applicant for an MMD endorsed as a QMED rating must have a minimum of six months of underway service in a rating at least equal to that of wiper. This service may have been aboard government or military vessels or other vessels not required to carry certificated personnel. OCMI's shall evaluate such service to ensure that it is the equivalent of service as a wiper. The presence of a "walk in" engine room, generators independent of the main engines and other independent auxiliaries indicates that a vessel's construction may require a crew member performing a wiper's duties.

2. Service As A Maintenance Person.

Time served in the maintenance department of a vessel, where a maintenance department is allowed by the vessel's COI, is considered 50% deck service and 50% engine service, unless the certificate of discharge specifies otherwise. The portion of service in the engine department may be credited toward the service required for a QMED rating.

3. Endorsement Of QMED Ratings.

All QMED ratings shall be endorsed separately. When a mariner has met the requirements for all QMED ratings, the document shall be endorsed "QMED-Any rating." The holder of a merchant mariner's document endorsed with one or more qualified member of the engine department ratings may serve in any unqualified rating in the engine department without specific endorsement.

4. Applicants Examined For Other Ratings At The Same Time.

An applicant for one QMED rating may be examined at the same time for all ratings for which eligible. An applicant being examined for one of the QMED ratings who has previously completed the QMED-General section within the past 12 months is not required to be tested on this section again.

5. Endorsement For Designated Duty Engineers (DDEs).

Under 46 CFR 12.02-11(d)(2), Designated Duty Engineers of 4000 horsepower and unlimited horsepower qualify to have their MMDs endorsed as "Any unlicensed rating in the engine department." Designated Duty Engineers of 1000 horsepower do not qualify.

G. Tankerman Ratings.

See Chapter 17

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART A: MARINER CREDENTIALING

CHAPTER 17: TANKERMAN

To Be Developed.

**PART B: VESSEL MANNING
FOREWORD**

The administration of safe manning for regulated U.S. vessels is the distinct responsibility of the U.S. Coast Guard. Internationally, the Administration's responsibility is rooted in the International Convention for the Safety of Life at Sea (SOLAS), 1974, as amended, Chapter V Regulation 14 (see IMO Resolution MSC.325(90)). An inherent function of the Officer in Charge, Marine Inspection (OCMI) is to establish the minimum number of mariners required, including the qualifications and conditions of service, for the safe operation of inspected and certain uninspected vessels. Accordingly, verification for compliance with those terms and conditions, as well as with applicable statutes for all commercial vessels, is a primary duty of the Marine Inspector.

In carrying out this charge, a host of elements and variables require due consideration and coordination with the vessel owner/operator, including the broad application of domestic regulations, international standards, watchkeeping provisions, vessel particulars, and operational factors. With a view of maintaining national consistency, the information in this Part (B) [legacy Chapters 20-26] has been reformatted and structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively.

Chapter B1 contains policy and guidance for uniform application of the statutes and regulations that relate to the manning of inspected and uninspected vessels. This material should be used to determine and verify compliance with the minimum safe manning levels, in conjunction with the applicable manning laws, regulations, and official directives. Chapter B2 provides sample manning scales for both general and specific classes of inspected vessels and is intended to help explain the various statutes, regulations, court decisions, and practices associated with minimum manning requirements. Chapter B3 provides supplementary policy and guidance on the manning requirements for credentialed officers, as well as a detailed discussion on the impact of various international standards. Chapter B4 contains supplemental policy and guidance on the impact of laws and international treaties related to the assignment of seamen, credentialed ratings, and non-credentialed crew. Chapter B5 outlines various watchstanding requirements and shipboard working conditions relevant to U.S. vessels. Chapter B6 discusses the acceptance of automated systems to replace specific personnel or to reduce overall crew requirements. Chapter B7 discusses the statutes and regulations that apply to various uninspected vessels, including certain yachts.

NOTE: Unless specified otherwise, the term "credential" used throughout Part B, Chapters 1-7, of this Volume includes legacy merchant mariner licenses (MML), merchant mariner documents (MMD), certificates of registry (COR), and STCW certificates which ceased to be valid after April 9, 2014. For the purposes of these Chapters the terms credentialed master, mate, engineer, and operator mean an officer endorsement as prescribed in 46 CFR Part 11. Unless expressly stated otherwise, the terms rating and crewmember pertain to endorsements as prescribed in 46 CFR Part 12. In general, the term "unlicensed" used throughout Part B refers to ratings and crewmembers, including non-credentialed crew (not otherwise subject to 46 U.S.C. 8701) in some cases. See the Annex for samples of merchant mariner credentials. (2014)

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING****A. Introduction. (2014)**

Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. This Chapter contains guidance for correct, uniform application of the statutes and regulations that relate to the manning of inspected and uninspected vessels. This material is used by Coast Guard marine safety personnel to determine and verify compliance with the minimum safe manning levels, in conjunction with the applicable manning laws, regulations, and official directives. Chapter B2 is intended to assist in the translation of the various statutes, regulations, court decisions, and practices into minimum manning requirements by presenting sample manning scales for both general and specific classes of inspected vessels. Chapter B3 provides supplementary policy and guidance on the manning requirements for credentialed officers, as well as a detailed discussion on the impact of various international standards. Similarly, Chapter B4 contains supplemental policy and guidance on the impact of laws and international treaties, which may imply or indirectly require the assignment of seamen, credentialed ratings, and non-credentialed crew. Chapter B5 outlines various watchstanding requirements and shipboard working conditions relevant to U.S. vessels. Chapter B6 discusses the acceptance of automated systems to replace specific personnel or to reduce overall crew requirements. Chapter B7 discusses the statutes and regulations that apply to various uninspected vessels, including certain yachts.

B. Authority.**1. Statutes And Implementing Regulations. (2014, 2017)**

- a. Division of crew into watches: 46 U.S.C. 8104; 46 CFR 15.705.
- b. Work hours and rest periods: 46 U.S.C. 8104; 46 CFR 15.1111; 46 CFR 15.710.
- c. Able seamen: 46 U.S.C. 7306-7312 and 8702; 46 CFR 15.1103; 46 CFR 15.840.
- d. Lifeboatmen: 46 U.S.C. 7316 and 8101; 46 CFR 15.845 and 199.100.
- e. Mates: 46 U.S.C. 7102 and 8301; 46 CFR 15.1103; 46 CFR 15.810.
- f. Masters: 46 U.S.C. 7102 and 8301; 46 CFR 15.1103; 46 CFR 15.805.
- g. Radar observers: 46 CFR 15.815.
- h. Chief engineers: 46 U.S.C. 7102 and 8101; 46 CFR 15.1103; 46 CFR 15.820.
- i. Engineers: 46 U.S.C. 7102, 8101 and 8301; 46 CFR 15.1103; 46 CFR 15.825.
- j. Pilots: 46 U.S.C. 7101, 8101 and 8502; 46 CFR 15.812.
- k. Lookouts: 46 CFR 15.850.
- l. Fire patrolmen and cabin watchmen: 46 U.S.C. 8102; 46 CFR 15.855 and 78.30.
- m. Radio officer/radiotelegraph operator watches: 46 U.S.C. 7101-7103, 7318 and 8101; 46 CFR 15.1103; 46 CFR 15.830.
- n. GMDSS Operator(s) and GMDSS Maintenance: 46 CFR 15.817; 47 CFR 80.1073 and 80.1074.
- o. Tankermen: 46 U.S.C. 3703, 7317, 8703, 9101 and 9102; 33 CFR 155.710; 46 CFR 31.15 and 15.860.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

- p. Operators: 46 U.S.C. 8104(h), 8903 and 8904; 46 CFR 15.535, 15.601, 15.605, 15.610 and 15.705.
- q. Staff officers: 46 U.S.C. 7101, 7102 and 8302; 46 CFR 15.835.
- r. Qualified members of the engineering department (QMEDs): 46 U.S.C. 7313 and 7314; 46 CFR 15.1103.
- s. Ordinary seamen: 46 U.S.C. 8702; 46 CFR 12.25-10 and 15.840.
- t. Crew citizenship: 46 U.S.C. 8103 and 12131; 46 CFR 15.720.

The manning regulations previously in 46 CFR Part 157 (1986 edition), were revised to reflect technological developments, the recodification of Title 46, United States Code (USC), and changes in terminology associated with merchant vessel manning. The former Part 157 was also relocated to Part 15 for convenience. (52 FR 38614, October 16, 1987). The Secretary of the Department of Homeland Security (Secretary) has authorized the Commandant to perform the functions required of the Secretary by these laws. This authority has been further delegated in Part 1 of Titles 33 and 46, Code of Federal Regulations (CFR), this manual, and instructions issued to marine safety personnel.

2. General Manning Authority. (2014)

The general regulations for manning of vessels are contained in 46 CFR 15 (Subchapter B, Merchant Marine Officers and Seamen). Requirements concerning certificated lifeboatmen, fire patrolmen, and other vessel specific manning standards are detailed in the parts of the regulations dealing with the inspection of that particular type of vessel. The general manning and crewing requirements for vessels and facilities operating on the U.S. Outer Continental Shelf are contained in Part 141 of Title 33 (Subchapter N, Outer Continental Shelf Activities).

3. State Manning Requirements. (2017)

Under the federalism principles articulated by the Supreme Court of the United States in the consolidated cases of *United States v. Locke and Intertanko v. Locke*, 529 U.S. 89, 120 S.Ct. 1135 (March 6, 2000), States generally cannot regulate vessel personnel qualification or manning requirements. One exception, however, is that States may establish pilotage requirements in the bays, rivers, harbors, and ports of the United States unless the law specifies otherwise (see Section B3.D). Ultimately, federalism is a question of constitutional law that cannot be conclusively answered by the OCMI, and your district legal office should be notified of instances, if any, of such State regulation. Contact your district legal office with any questions. When in doubt, vessel operators should independently check State law.

NOTE: While an individual State of the United States may issue a “certificate of number” (aka Boat Registration Certificate) to an appropriate vessel (33 CFR Part 173), in no such case may a State issue or endorse a Certificate of Inspection, Safe Manning Document or any international statutory certificate. Only U.S. federal agencies are granted the authority to act as the Flag Administration for international conventions and instruments. (2017)

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING****C. Responsibility Of The Officer In Charge, Marine Inspection (OCMI). (2014, 2017)**

Under 33 CFR 1.01-20, the OCMI is responsible for the enforcement of vessel inspection, navigation, and seamen's laws within a specific zone. In this capacity, the OCMI is responsible for establishing manning levels for various types of vessels. The Certificate of Inspection (COI), Form CG-841, states the minimum number of credentialed officers and crewmembers necessary for the safe operation of inspected vessels, as required by 46 U.S.C. 8101 and 46 CFR 15.501. Also, many uninspected U.S. merchant vessels are subject to the manning requirements of 46 U.S.C. 8103, 8104, 8304, 8701-8703, 8903 and 8904. The International Convention for the Safety of Life at Sea (SOLAS), Chapter V, Regulation 14 requires each vessel to which SOLAS Chapter I applies to be issued a "Safe Manning Document." Refer to Chapter B3 for a more detailed discussion on Safe Manning Documents for inspected and uninspected vessels. The watch system is not required to be stated on the COI.

NOTE: Reference MSM Volume II, Section B.1.D.1.h. for information on trial trips/sea trials. Minimum manning levels should be agreed to and verified by the OCMI in advance. (2017)

1. In establishing the safe manning level for a certificated vessel, the OCMI should consider the following factors, in addition to statutory and regulatory requirements:
 - a. Size of the vessel;
 - b. Route;
 - c. Hull and equipment maintenance needs (protective coatings, cargo gear, equipment sophistication, etc.);
 - d. Type and horsepower of propulsion machinery;
 - e. Maintenance of machinery and equipment;
 - f. Degree of automation of deck and engineroom equipment;
 - g. Type of cargo;
 - h. Cargo transfer system;
 - i. Fire protection systems (crew operational requirements)
 - j. General arrangement of vessel equipment as it relates to crew operational requirements;
 - k. Lifesaving equipment
 - l. Level of qualification of each crew position to perform tasks demanded by the vessel's Mission;
 - m. Number of passengers carried;
 - n. Hazards peculiar to route and service;
 - o. Hours of operation within a 24-hour period;
 - p. Successful operation of similar vessels;
 - q. Reasonable work/rest hour limits;
 - r. The existing safety record of the vessel; and
 - s. International Maritime Organization guidelines (IMO Resolution A.1047(27), entitled "Principles of Minimum Safe Manning") and other international standards, as applicable (See paragraph C.2. below).

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

2. In addition to the factors above, for vessels on international voyages, the OCMI should take proper account of existing international (IMO, ILO, ITU, and WHO) instruments in force and any applicable coastal state agreements (i.e. MOU/MOA) which deal with:
 - a. Watchkeeping;
 - b. Hours of work or rest;
 - c. Safety Management;
 - d. Certification of seafarers;
 - e. Training of seafarers;
 - f. Occupational safety, health, and hygiene;
 - g. Crew accommodations and food;
 - h. Security; and
 - i. Radio communications.

The international instruments pertaining to these factors are discussed in greater detail throughout Part B, Chapters 1-7, of this Volume.

D. Determining Minimum Manning (Manning Proposal). (2014, 2017)

In establishing minimum manning required for safe operation, in addition to mandated levels of manning for safe navigation, the OCMI should also consider other vessel operations, such as cargo handling, emergency evolutions, and preventive maintenance. The sample manning scales in Chapters B2 and B7 have been provided as guidance. The OCMI is not compelled to assign manning levels according to the sample scales presented, as they are neither mandatory, nor all inclusive. To supplement a manning request or when alternatives to the sample manning scales are sought, the cognizant OCMI should request the company responsible for the operation of the vessel to prepare and submit its proposal for the minimum safe manning of that vessel. The company should;

NOTE: In preparing a proposal for the minimum safe manning of a vessel on an international voyage, the company should apply the principles, recommendations and guidelines contained in IMO Assembly Resolution A.1047(27). (2014)

1. Make an assessment of the tasks, duties and responsibilities of the vessel's complement required for its safe operation, security, protection of the marine environment, and for dealing with emergency situations. For vessels equipped with Dynamic Positioning Systems (DPS), and/or other specialized operating systems, the proposal should include any particular manning requirements as specified in the applicable operating manual;
2. Ensure that fitness-for-duty provisions and work/rest hour requirements are considered;
3. For seagoing vessels subject to STCW, make an assessment of numbers and grades/capacities in the vessel's complement required for its safe operation, security, protection of the marine environment, and for dealing with emergency situations. The

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

Manning and STCW Certification Reference Tables in Chapter B2 provide guidance on the numbers of credentialed deck and engineer officers appropriate for different sizes of vessels (tonnage), trading areas, and aggregate propulsion power;

4. Prepare and submit to the cognizant OCMI a proposal for the minimum safe manning based upon the above assessment. The proposal should include how the vessel's complement will deal with emergency situations, including the evacuation of passengers, where necessary. Owners/operators are encouraged to prepare and submit completed sample tables of duties and rest logs to conceptually facilitate the OCMI's evaluation of the manning proposal. In many cases these samples can be modeled after similarly operated U.S. flagged vessels within a company's management;
5. Ensure that the proposed minimum safe manning is adequate at all times and in all respects, including meeting peak workload situations, conditions and requirements, and for vessels on international voyages, is in accordance with the principles, recommendations and guidelines contained in IMO Assembly Resolution A.1047(27); and
6. Prepare and submit to the cognizant OCMI a new proposal for the minimum safe manning of a vessel in the case of changes in trading area(s), construction, machinery, equipment, operation and maintenance or management of the vessel, which may affect the safe manning. Title 46 CFR 15.505 requires that all requests for changes in manning as indicated on the COI, Safe Manning Document (SMD), or Safe Manning Letter (SML) must be made to the OCMI who last issued the COI or SMD/SML, unless the request is made in conjunction with an inspection for certification, in which case the request should be addressed to the OCMI conducting the inspection. Refer to the Minimum Safe Manning Proposal (Template) in the Annex.

E. Proposal Evaluation. (2014, 2017)

1. The OCMI should evaluate a company's proposal for minimum safe manning and ensure that:
 - a. The proposed vessel's complement contains the number and grades/capacities of personnel to fulfill the tasks, duties and responsibilities required for the safe operation of the vessel, for its security, protection of the marine environment, and for dealing with emergency situations; and
 - b. The master, officers and other members of the vessel's complement are not required to work more hours than is safe in relation to the performance of their duties and the safety of the vessel, and that the requirements for work and rest hours, in accordance with applicable international and national regulations, can be complied with.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

2. If the company's proposal is determined to be insufficient, the OCMI should respond providing justification and outline manning levels that are considered acceptable. This may include requesting an amended minimum safe manning proposal.
3. The OCMI should only approve a proposal for the minimum safe manning of a vessel and issue a COI or SMD/SML if he/she is fully satisfied that the proposed vessel's complement is established in accordance with the principles, recommendations and guidelines contained herein, and is adequate in all respects for the safe operation and security of the vessel and for the protection of the marine environment. The established manning level must not be less than the minimums stipulated by law or regulation. The proposal and resulting determination should be thoroughly documented in MISLE.
4. Unless expressly provided for under law or regulation, the OCMI should consider the circumstances very carefully before allowing a COI or SMD/SML to contain provisions for less than three qualified officers in charge of a navigational watch, while taking into account all the principles for establishing safe manning as applicable. See Chapters B2, B5, and B7 for additional information on vessels permitted to maintain a two-watch system. Refer to the MMS Work Instruction in the Annex.

F. U.S. Coast Guard Oversight. (2014, 2017)

During inspection activities, Coast Guard personnel shall verify compliance with the manning level specified on the COI, or SMD/SML, as well as with any other applicable manning regulations. This should include a review of credentials and the crew list to ensure authenticity, validity, and service within any endorsement restrictions. Coast Guard personnel should be mindful that an MMC authorizes the holder to serve in any capacity endorsed thereon, or in any lower capacity in the same department, or in any capacity covered by a general endorsement with respect to grade, propulsion mode, propulsion power, tonnage, route, and special limitations/waivers. Evidence that the vessel or its crew does not correspond with the relevant requirements or that the vessel is otherwise being operated in such a manner as to pose a danger to persons, property or the environment may lead to clear grounds for a more detailed/expanded inspection and/or audit of the safety management system (if applicable). See paragraph K.3 of this Chapter as well as Chapter B5 of this Manual for additional information. Refer to the Safe Manning Verification Check-sheet in the Annex.

NOTE: MMCs can be verified in MISLE under the Parties tab by selecting System: MMLD or online using the MMC Verification Tool. (2017)

1. Examples of Clear Grounds. (2014)
Examples of clear grounds include but are not limited to;
 - a. The vessel is found not in compliance with the minimum manning specified on its COI or SMD/SML (see 46 U.S.C. 3313).

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

- b. Failure of a crewmember to have/hold an appropriate certificate;
- c. Absence in the watch of a person qualified to operate equipment essential to safe navigation, radio communications, or pollution prevention;
- d. Failure to comply with applicable work hour limits/hours of rest provisions;
- e. Inability of crewmember(s) to perform their assigned duties during abandon ship or fire-fighting drills;
- f. Inability of watchkeeping officers(s) to communicate in English;
- g. Inability of crewmember(s) to operate shipboard equipment necessary to complete operational tests as required during the general examination;
- h. Objective evidence to indicate that the master and/or crew are not familiar with their specific duties and with ship arrangements, installations, equipment, procedures, and ship characteristics that are relevant to their routine or emergency duties;
- i. Indications that key crewmembers are not able to communicate or coordinate with each other or with other persons on board; and
- j. The company fails to submit a new proposal for the vessel's minimum safe manning when changes in trading area(s), construction, machinery, equipment, operation and maintenance or management of the vessel have taken place which affects the minimum safe manning.

NOTE: Changes in management or operating company that necessitate the reissuance or amendment of the COI/SMD should prompt an administrative review of safe manning. See paragraph B1.D.6. (2017)

2. Expanded Inspections. (2014)

The following guidance should be adhered to when conducting an expanded inspection:

- a. The expanded inspection should focus on identifying all related deficiencies and subsequently providing the master an opportunity to correct them before concluding the inspection.
- b. For certain vessels, non-compliance may indicate a potential safety management system failure, warranting an additional ISM audit. Guidance regarding the enforcement of the ISM Code is contained in MSM Volume II, Section E.3.A.
- c. Coordination with the Investigations Division may be necessary should the expanded inspection indicate a possible violation or question crew competency.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**3. Control Procedures and Deficiencies. (2014)

A more detailed/expanded inspection and/or audit of the safety management system (if applicable), could result in a non-conformity, deficiency, removal of the COI or SMD/SML, and/or violation of law or regulation. In the case of an inspected vessel, the OCMI can consider the removal of the COI or issuing a deficiency where the conditions of the vessel or its crew do not correspond substantially with the applicable regulations. The Vessel/Facility Inspection Requirements, Form CG-835, should be issued to document deficiencies, including prior to departure (“NO-SAILS”) when warranted. All deficiency descriptions should be as specific and descriptive as possible using quantifiable language and include the convention or regulatory cites for reference. A compliance date appropriate to the nature of each deficiency should be assigned. In making the determination, the OCMI should consider the following: the nature and severity of the deficiency, the time normally needed to correct such a deficiency, the availability of resources to correct the deficiency, and the vessel’s itinerary. For uninspected vessels, the OCMI can consider the removal of the SMD/SML. However, this may not have the same, immediate, effect as removing the COI or issuing a NO-SAIL requirement to an inspected vessel. In the case where the conditions of an uninspected vessel or its crew do not substantially correspond with the applicable regulations and a serious threat to the safety of personnel or the vessel or a serious risk to the environment is clearly evident the OCMI should consider available authority alternatives for ensuring compliance prior to departure. In either the case of an inspected or uninspected vessel, evidence, such as persistent non-compliance with rest hour requirements, may warrant a violation or personnel investigation. The marine inspector should ensure all actions are documented in MISLE. Any actions that restrict the movement or operations of a vessel should be accompanied by a MISLE “Operational Control.”

G. Administration Of Manning Scales. (2014)

For the purpose of manning, the cognizant OCMI refers to the zone in which the vessel primarily operates. The vessel should be included in the cognizant OCMI’s MISLE Fleet of Responsibility. When a vessel is certificated in one zone for operation in another, to ensure all OCMI specific interests are addressed, the development of the vessel’s minimum safe manning should be coordinated between both OCMI’s. If a vessel changes its primary area of operation to another zone, the OCMI should ensure that any outstanding inspection activities are updated, filed and entered into MISLE. The receiving OCMI should add the vessel to their MISLE Fleet of Responsibility. For transient vessels that call regularly on multiple OCMI zones, the cognizant OCMI is the OCMI that issued the COI. Manning of special or unique vessels shall be coordinated with Commandant (CG-CVC). Consult Volume I of this manual concerning waivers and appeals of manning requirements. In accordance with 46 CFR 15.510, any person directly affected by a decision or action taken under Part 15, by or on behalf of the Coast Guard, may appeal in accordance with 46 CFR 1.03.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING****H. Citizenship Requirements For Seamen On U.S. Documented Vessels And Foreign Vessels Within U.S. Jurisdiction. (2014, 2017)****1. Definition Of Seaman. (2014, 2017)**

In general, the term "seaman" is interpreted broadly by the Coast Guard to mean any individual engaged or employed in the business of a vessel or a person whose efforts contribute to accomplishing the vessel's business, whether that person is involved with operation of the vessel. This interpretation is consistent with expressions of congressional intent, and with judicial opinions regarding the use of the term "seaman" throughout Title 46 of the U.S. Code.

- a. A crewmember may be a seaman although he or she is not occupying a position required by the Certificate of Inspection or other Safe Manning Documentation. However, persons who are on board the vessel in a capacity other than as crewmembers are considered passengers and are not subject to the citizenship requirements; except if the person is filling a position that is designated as a "person in addition to the crew". Reference MSM Volume II Section A Chapter 3.H.2 for additional information on Persons On-Board Other Than the Minimum Operating Crew. For information on Riding Gangs, reference Chapter B.1, Section J.6.
- b. Under normal conditions, the Coast Guard does not consider a person who is briefly visiting the vessel in a consulting capacity (e.g., a vendor's technical representative) to be a crewmember. Similarly, the Coast Guard does not apply citizenship requirements to shoreside personnel who come on board vessels while they are not underway to load or unload cargo or to perform services such as maintenance of shipboard equipment. However, under most circumstances, individuals being compensated for performing their jobs while the vessel is underway are considered seamen for the purpose of applying citizenship requirements. Waiters, entertainers, industrial personnel, oil recovery workers, riding maintenance crews, and others employed in the business of the vessel are considered seamen.
- c. The actual details of a particular situation will determine whether in fact the individual in question is a seaman for the purpose of 46 U.S.C. 8103.

2. General Citizenship Requirements.

46 U.S.C. 8103(a) states that only a citizen of the United States may serve as master, chief engineer, radio officer, or officer in charge of a deck or engineering watch on a vessel documented in the United States. Section 8103(b) further states that each unlicensed seaman must be a citizen of the United States or an alien lawfully admitted to the United States for permanent residence, and not more than 25 per cent of the total number of unlicensed seamen on the vessel may be permanent resident aliens. 43 U.S.C. 1356 also imposes U.S. citizenship requirements on U.S. vessels and certain foreign vessels engaged in Outer Continental Shelf (OCS) activities on waters above our OCS.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

- a. 46 U.S.C. 8103 Exemptions. (2014)
Yachts, fishing vessels fishing exclusively for highly migratory species, and fishing vessels fishing outside the exclusive economic zone of the United States are specifically exempted from the unlicensed seaman citizenship requirements. Except for the master, any unlicensed persons serving aboard such vessels do not have to be U.S. citizens. 46 U.S.C. 12131 provides that a documented vessel may be placed under the command only of a citizen of the United States, even if the individual is unlicensed. (See B1.H.4. or Chapter B7 of this Volume for further discussion.)
- b. 43 U.S.C. 1356 Determining Citizenship Requirements. (2017)
The implementing regulations for § 1356 are found in 33 CFR Part 141. The citizenship requirements will not apply to a foreign-flagged unit which has been determined to be majority foreign owned and/or controlled. To be considered foreign-owned and/or controlled, the unit must be more than 50 percent owned and/or controlled by a foreign citizen(s) or entity. However, U.S. citizenship requirements may be imposed if the President determines that the vessel's flag country, or the nation that the owners or charters are citizens of or incorporated within, are discriminating against American vessels by excluding U.S. citizens and resident aliens from U.S. vessels engaged in offshore activities off of its shore. For guidance concerning those units determined to be subject to the citizenship requirements e.g., a unit that has a majority U.S. interest or is flagless, see Chapter B1.H.5.e. below.
- (1) Provisions For Bareboat Chartered Vessels. (2014)
Ownership and control of an OCS unit can be significantly altered by bareboat charter. [e.g. the owner/operator of a foreign vessel bareboat chartered to a U.S. citizen or corporation must employ U.S. citizens/resident aliens. Or if a foreign-flagged, American owned vessel is under a long term bareboat charter to a foreign citizen or corporation, it may be eligible for an exemption. (See B1.H.5.e of this Chapter for additional guidance.)] Refer questions involving bareboat charter to Commandant (CG-CVC).
- c. 46 U.S.C. 8103(k) Large Passenger Vessels. (2017)
See 46 CFR 15.530 for requirements pertaining to non-resident alien crewmembers holding Coast Guard-issued MMCs on U.S. flag large passenger vessels. For a detailed discussion on these requirements, see 74 FR 47729.
3. Subsidy Vessels.
Citizenship requirements for U.S. vessels for which a construction or operating differential subsidy has been granted are stated in 46 U.S.C. 8103(c) and (d).
4. Commercial Fishing Vessels. (2014)
The citizenship requirements applicable to fishing industry vessels are based on the specific class of vessel and its area of operation.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

- a. Within U.S. Exclusive Economic Zone (EEZ). (2014)
 46 U.S.C. 8103(i) provides that each unlicensed seaman on board a U.S. flagged commercial fishing, fish processing or fish tender vessel that is engaged in the fisheries in the navigable waters of the United States or within the EEZ must be:
- (1) a citizen of the U.S.;
 - (2) an alien admitted to the U.S. for permanent residence;
 - (3) any other alien allowed to be employed under the Immigration and Nationality Act 8 U.S.C. 1101 et seq; or
 - (4) an alien allowed to be employed under the immigration laws of the Commonwealth of the Northern Mariana Islands if the vessel is permanently stationed at a port within the Commonwealth and the vessel is engaged in the fisheries within the exclusive economic zone surrounding the Commonwealth or another United States territory or possession.

This provision allows 100% of the unlicensed seamen employed on such vessels operating within our EEZ to be resident aliens. However, not more than 25% of the unlicensed seamen on each vessel may be non-resident aliens identified in subparagraph B1.H.4.a.(3) above. (As noted previously in paragraph B1.H.2.a, a fishing vessel fishing exclusively for highly migratory species is exempt from these requirements.)

- b. Outside U.S. EEZ. (2014)
 A fish processing vessel and fish tender vessel operating outside the U.S. EEZ must meet the more stringent citizenship requirements of 46 U.S.C. 8103(b). A combination catcher/processor is considered a fish processing vessel unless it engages exclusively in fishing without processing any catch. A fishing vessel fishing outside the EEZ is exempt from the citizenship requirements for unlicensed seamen. (See Chapter B7 of this Volume for more information.)
- c. Distant Water Tuna Fleet. (2014, 2017)
The Coast Guard and Marine Transportation Act (CGMTA) of 2006 (Pub. L. 109-241, Sec. 421), as amended by the 2010 Coast Guard Authorization Act (CGAA, Pub. L. 111-281, Sec. 904), the Coast Guard and Maritime Transportation Act of 2012 (Pub. L. 112-213, Sec. 701), and the Howard Coble Coast Guard and Maritime Transportation Act of 2014 (Pub. L. 113-281, Sec. 601) specifies the requirements, restrictions and limitations for a foreign citizen manning exemption on Distant Water Tuna Fleet (DWTF) purse seine fishing vessels licensed to fish under the 1987 South Pacific Tuna Treaty (SPTT). Owners/operators of these vessels should provide documentation, in accordance with the established Commandant (CG-CVC) procedure, to validate and receive a determination for credential equivalency and

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

foreign citizen manning exemption applicable to their vessel. Those vessels that are found to satisfy the requirements and provisions of the CGMTA 2006, as amended, will receive a foreign citizen manning exemption letter from the Coast Guard, accepting the use of foreign citizens to meet U.S. manning requirements (excluding the master). The latest policy guidance is found in the 27 March 2015 CG-CVC Policy Letter 13-04 CH-01.

5. Waivers.

46 U.S.C. 8103(b)(3) authorizes the Secretary to waive a citizenship requirement, other than the requirement that applies to the master of a documented vessel, with respect to an offshore supply vessel or other similarly engaged vessel that operates from a foreign port; a mobile offshore drilling unit or other vessel engaged in support of exploration, exploitation, or production of offshore mineral energy resources operating beyond the waters above the U.S. OCS; and any other vessels if the Secretary determines, after investigation, that qualified seamen who are citizens of the United States are not available. Under the Act of December 27, 1950, (46 App. U.S.C. 1 note; 64 Stat. 1120), "An Act to authorize the waiver of the navigation and vessel-inspection laws" the Coast Guard is directed to waive compliance of the navigation and vessel-inspection laws upon the request of the Secretary of Defense, to the extent deemed necessary in the interest of national defense by the Secretary of Defense. 43 U.S.C. 1356 authorizes "exemptions" from citizenship requirements for vessels operating on waters above the U.S. OCS.

a. Offshore Supply Vessels (OSVs) And Mobile Offshore Drilling Units (MODUs). (2014, 2017)

46 U.S.C. 8103(b)(3)(A) and (B) as implemented by 46 CFR 15.720, provides a general waiver from the citizenship requirements authorizing the employment of foreign nationals, except for the master and radio officer, aboard OSVs operating from foreign ports and MODUs operating beyond the waters above the U.S. OCS. As noted below, this general waiver does not apply if the OSV or MODU, though it has departed from a foreign port, engages in operations on the U.S. OCS. In these cases, the vessel may be subject to the separate citizenship requirements of the Outer Continental Shelf Lands Act, 43 U.S.C. 1356(c). See subparagraph B1.H.5.e. below, 33 CFR 141, and NVIC 7-84 for guidelines on exceptions from OCS citizenship requirements and procedures relating to waivers from these requirements. U.S. vessels operating under the waivers provided for under 46 U.S.C. 8103(b)(3)(A) or (B) do not have secure areas (see 33 CFR 101.105) and therefore are not required to observe TWIC requirements. However, all other MTSA requirements remain unchanged. This waiver allows offshore supply vessels and mobile offshore drilling units to employ foreign crew when operating from a foreign port or beyond the Outer Continental Shelf (see 72 FR 3492 [January 25, 2007]). However, when these vessels are not operating under these waivers (e.g., within the U.S. Outer Continental Shelf and shoreward), they do have secure areas and are required to comply with TWIC requirements.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

NOTE 1: Section 617 of the Coast Guard Authorization Act of 2010 (PL 111-281) amended 46 U.S.C. 2101(19) by removing the tonnage limitation in the definition of ‘offshore supply vessel.’ As a result, OSVs as defined under 46 U.S.C. 2101(19) are covered under this waiver, while operating from a foreign port, regardless of tonnage limitation (46 CFR 15.720(b)(1)). The 1,600 GRT (GT ITC if GRT is not assigned) limitation specified in 46 U.S.C. 8103(b)(3)(A) pertains to other similarly engaged vessels, which are not covered under 46 CFR 15.720(b). For other vessels in service similarly engaged, see Section H.5.b. of this Chapter. (2014)

NOTE 2: The term OSV, as used in this section, includes those vessels certificated under Subchapters L, I and T as noted in 46 CFR 125.100(b), as well as crew boats certificated as small passenger vessels when carrying individuals other than those defined in 46 U.S.C. 2101(21) [see H.R. Rep. No 98-338, at 138 (1983) (commenting on Section 3301 of P.L. 98-89 (S. 46))] while engaged in support of exploration, exploitation or production of offshore mineral or energy resources. However, it does not include multi-service (Certificated) vessels operating in any service other than as an OSV (see Chapter B2, Section V). For other vessels in service similarly engaged, see Section H.5.b. of this Chapter. (2014)

- (1) This waiver was necessary to allow the described vessels to operate in areas subject to foreign jurisdiction, not necessarily for global circumnavigation, where local citizenship requirements may apply and where the recruitment of U.S. citizens may be impractical. Due to the limited possibilities for employment of non-U.S. credentialed officers in most segments of the maritime industry, the U.S. has not entered into agreements with other Parties that would allow the endorsement of certificates issued in accordance with the International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW), as amended. In consideration of this conflict and until such a time that the U.S. fully implements STCW Regulation I/10, through 46 CFR Part 11 Subpart J, owners/operators of vessels subject to 46 CFR 15.720(b) may request that the cognizant OCMI add the following endorsement to the COI;

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

WHEN OPERATING FROM A FOREIGN PORT, NOT ON U.S. WATERS, FOREIGN NATIONALS WITH VALID STCW CERTIFICATES, ISSUED BY A COUNTRY DEEMED BY THE IMO TO BE GIVING FULL AND COMPLETE EFFECT TO THE STCW CONVENTION, AS AMENDED, MAY SERVE AS AN OFFICER WITHOUT ADDITIONAL ENDORSEMENT, PROVIDED THE MASTER ADHERES TO TITLE 46, CODE OF FEDERAL REGULATIONS (CFR) 15.720(D). THE MASTER OF THE VESSEL MUST BE A U.S. CITIZEN, DULY CERTIFICATED BY THE UNITED STATES.

THIS ENDORSEMENT ESTABLISHES CONFORMITY WITH THE SAFE MANNING REQUIREMENTS OF THE UNITED STATES PERTAINING TO 46 CFR 15.720(B) IN FULL CONSIDERATION OF THE GUIDING PRINCIPLES FOR PORT STATE CONTROL (APPENDIX 11, IMO RESOLUTION 1052(27), AS REVISED).

Failure to comply with the COI will constitute a violation of 46 CFR 15.515. While operating within the terms of this endorsement, the Master should pay due regard to paragraphs (2) and (3) below. The Coast Guard will advise the maritime industry when the United States has entered into an agreement for the recognition, by endorsement, of certificates issued by or under the authority of another Party. Questions and Port State Control concerns may be addressed to Commandant (CG-CVC-1) via the Cognizant OCMI.

- (2) Vessel owners/operators should be cognizant of the citizenship waiver limitations for vessels returning to the U.S. after operating from a foreign port. The citizenship waiver found in 46 CFR 15.720(b)(1) applies only to OSVs operating from a foreign port. While it is beyond the scope of this guidance to describe every situation that constitutes "operating from a foreign port," any voyage that begins, terminates or includes intermediate port calls at a U.S. port or place is not considered "operating from a foreign port." The citizenship waivers in 46 CFR 15.720(b) do not apply to any vessel operating in the waters above the U.S. OCS. See 46 CFR 15.720(c). The term "operating" in that subsection is not limited solely to resource exploration or exploitation activities but includes field or ocean transits. Subject vessels must be manned with a crew that is fully compliant with the U.S. citizenship, credentialing, and Transportation Worker Identification Credential (TWIC) requirements.
- (3) 46 CFR 15.720(d) requires the master to assure that any replacements of crewmembers by non-U.S. citizens be with an individual who holds a credential that is equivalent in experience, training, and other qualifications to the U.S. credential required for the position. The master of the vessel should ensure that the mariner's qualifications as stated on his or her STCW endorsement are equivalent or superior to the officer endorsement qualifications required by the vessel's COI. Operators of vessels required to comply with the provisions of

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

SOLAS Chapter IX are reminded that, in accordance with clause 6.2 of the ISM Code, it is the responsibility of the Company to "ensure that each vessel is manned with qualified, certificated and medically fit seafarers in accordance with national and international standards."

- b. Other Vessels Engaged In OCS Activities. (2014)
The above general waiver only applies to OSVs and MODUs. Vessels of less than 1,600 GRT (GT ITC if GRT is not assigned), which are not OSVs, but are "similarly engaged" and operated from a foreign port; and vessels which are not MODUs, but are nonetheless engaged in support of exploration, exploitation or production of offshore energy resources beyond the waters above the U.S. OCS must apply to Commandant (CG-CVC) for an individual waiver. For additional clarification on tonnage applicability see paragraph B2.A.2. The CG-CVC waiver should be similarly endorsed in accordance with paragraph B1.H.5.a.(1).
- c. Miscellaneous Vessel Types.
Vessel operators of any other vessel may apply for a waiver under subsection 8103(b)(3)(C) when "qualified seamen who are citizens of the United States are not available." Due to the availability of U.S. merchant mariners, requests for waivers under this section are rare. These requests usually must be supported by Department of Labor (DOL) certifications that qualified citizens cannot be found for the identified positions.
- d. Commercial Fishing Vessels. (2014)
Section 8103(i) of title 46 U.S.C. allows 100% of the unlicensed seamen on commercial fishing vessels operating inside the U.S. EEZ to be permanent resident aliens. There is no waiver of citizenship requirements necessary for such vessels. Commercial fishing vessels operating inside the U.S. EEZ wishing to employ more than 25% of the unlicensed crew who are non-resident aliens (Section 8103(i)(2)) should request a waiver in accordance with 46 CFR Part 28 Subpart I. Also, fish processing vessels and fish tender vessels operating outside the EEZ are required to meet the statutory requirements of Section 8103(b) and may request a waiver in accordance with 46 CFR Part 28 Subpart I.
- e. OCS Citizenship "Exemptions" (Waivers).
43 U.S.C. 1356 and 33 CFR 141 provide three individual classes of exemptions for vessels and other units (including facilities, rigs, platforms or structures), engaged in OCS activities in waters above the United States OCS.
- (1) U.S. Controlled Or Owned Vessels/Units.
A temporary exemption may be granted to U.S. controlled or owned vessels/units if there are not a sufficient number of U.S. citizens or resident aliens qualified and available for work. Congress has made the Coast Guard the agency

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

responsible for accepting such waiver requests and granting such waivers if no U.S. citizens or resident aliens can be located for employment. (Refer to NVIC 7-84 for guidelines on exceptions from OCS citizenship requirements and procedures relating to waivers from these requirements.)

(2) National Registry Manning Requirement.

A foreign-flag, American-owned vessel/unit may receive an exemption for the marine crew from the citizenship requirements if the flag country of the vessel had a national registry manning requirement in effect before 18 September 1978 that required the flag country's nationals aboard vessels/units flying its flag. Also, contractual agreements made on an individual basis for a specific vessel may warrant the issuance of an exemption if such agreements were in effect before 18 September 1978.

(3) Presidential Declaration.

The President of the United States may grant an exemption for any position aboard a vessel if he determines that employment of American citizens or resident aliens would not be consistent with the national interest. This exemption would potentially be applied to address a national emergency or circumstances involving special foreign policy implications.

6. Enforcement. (2017)

Whenever a question arises as to whether or not a particular individual is properly documented as a permanent resident alien or other alien allowed to work, the Coast Guard officer should consult with local officials of the U.S. Customs and Border Protection (CBP) or U.S. Citizenship and Immigration Services (USCIS). Coast Guard units that are normally involved in enforcement of laws relating to fisheries should establish contact with the local CBP or USCIS office to discuss how questions concerning aliens will be addressed when they arise.

I. Crew Vacancies And "Sailing Short." (2014)

(See 46 CFR 15.725)

1. Introduction. (2014)

46 U.S.C. 8101(e) permits a master to "sail short," e.g., without meeting the manning requirements stated on the COI, under certain unusual circumstances. At the outset of a voyage a vessel should "possess" the complement of credentialed officers and crewmembers stipulated on the COI. The Shipping Articles, Form CG-705A, if required, would provide acceptable evidence of this. When vacancies occur at or after the time the crew is required to be aboard as specified in the Shipping Articles, the vessel may sail short, provided the vacancy was without the consent, fault, or collusion of the master, owner, or any other person interested in the vessel, and the master has made a

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

conscientious effort to find a qualified replacement. In addition, the master must be satisfied that the vessel is safe to make the intended voyage.

2. Restrictions.

Convenience-type discharges, vacation time granted in accordance with collective bargaining agreements, etc., are considered "consent" actions and, therefore, not appropriate reasons for sailing short. Desertion, failure to join, hospitalization, etc., are considered "no consent" cases and, may be grounds for sailing short if the master considers the remaining complement sufficient. However, at each port or place called at during the voyage (including the port of departure), the master has an obligation to obtain qualified replacements if they are available. The master need not obtain permission to sail short, but must report the situation in writing within 12 hours of arrival at the port of destination. The master's decision to sail short is subject to the OCMI's review and appropriate administrative action should be taken if warranted (see the Commandant's Decisions on Appeal, Nos. 2136 (Dillon) and 2172 (Chapman)).

NOTE: The difference between the sailing-short provision and a national defense waiver is based upon timing and purpose. The waiver is a shortage sanctioned for national defense considerations, and is obtained before the voyage. Sailing short is based solely on the master's judgment, and is the subject of an after-the-fact report, and is not based on national defense considerations. See MSM Volume I, Chapter 2.M.3.d. for Guidelines for National Defense Waivers of Manning Requirements. (2017)

3. Filling Vacancies With Foreign Crewmembers. (2014)

46 U.S.C. 8103(e) provides that if a documented vessel is "deprived for any reason of the services of an individual (except the master and the radio officer)" while on a foreign voyage, the resulting vacancy can be filled with an individual not a citizen of the United States "until the vessel's return to a port at which in the most expeditious manner a replacement who is a citizen of the United States can be obtained." The non-U.S. citizen crewmember should hold an equivalent certificate of competency appropriate for the position being filled. The vessel would be expected to replace the non-U.S. citizen crewmember at any subsequent port call where a qualified U.S. citizen could be dispatched to meet the vessel. Operators are reminded that, whenever a vessel is deprived of the service of a member of its complement and the master or person in charge is unable to find appropriately credentialed personnel to man the vessel, a report of sailing short must be filed in writing with the Officer in Charge, Marine Inspection (OCMI) having cognizance for inspection in the area in which the vessel is operating, or the OCMI within whose jurisdiction the voyage is completed. See 46 CFR 15.725 and paragraph B.1.H.5.a.(2). Vessels that have "secure areas" and are required to comply with the TWIC requirements should refer to the applicable procedures on security measures for access control per 33 CFR 104.265.

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING****J. Maintenance Department.****1. Background.**

In recent years, labor-saving devices and operational innovations have been introduced on merchant vessels that permit adjustments in the composition of the minimum crews required by the Coast Guard. These adjustments provide the vessel's master the flexibility to use the crew more effectively while still ensuring that sufficient qualified personnel are carried for continued safe operation of a vessel. Such adjustments may include maintenance-persons within the deck and engineering departments, or through the formation of a maintenance department. Personnel so assigned would perform duties on a regular work day basis, and would not be considered members of an established watch, as defined in 46 CFR 15.705.

2. Manning Factors.

The OCMI's authority for approving requests for changes in the required crew composition is contained in 46 CFR 15.501 and 46 U.S.C. 8101. These sections state that the COI issued to an inspected vessel specifies the minimum complement of licensed individuals and crew considered necessary for the safe operation of the vessel. Among the factors to be considered by the OCMI in determining the minimum crew complement are: installed equipment, degree of automation, use of labor saving devices, work hour limits, and the organizational structure of the vessel.

3. Crossover Between Deck And Engine Departments. (2014)

A modern vessel with a traditional deck/engine department organization may typically require 6 ABs and 3 QMEDs. When permitted by the COI, some of the individuals in a vessel's required crew complement may be engaged as maintenance-persons (deck or engine). All personnel so designated will hold ratings as AB for deck maintenance-person or an appropriate rating for engine maintenance-person. Deck or engine personnel assigned to their respective departments are subject to the crossover prohibition of 46 U.S.C. 8104(e). If the vessel establishes an acceptable maintenance department, the persons assigned to the maintenance department are available as a vessel's maintenance crew and are not subject to the crossover prohibition. These personnel may then be employed in a manner best satisfying the vessel's needs that is left to the discretion of the vessel master provided the master operates the vessel in accordance with the approved automation plan. Vessels reorganized with a maintenance department or maintenance-persons assigned to deck and engine departments would normally require credentialed ratings including 3 ABs in the deck department, and at least 5 maintenance-persons. (See Chapter B4 of this Volume for further discussion and sample manning scales for vessels which employ maintenance-persons as required crew.)

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**4. Watch Augmentation. (2014)

The required personnel in the maintenance department shall hold appropriate rating endorsements (AB, QMED, etc.) so that they may be used by the vessel's master to augment navigational or machinery space watches should the need arise. For those personnel not assigned to the maintenance department, watch assignments would be governed by departmental affiliation, except under circumstances noted in 46 U.S.C. 8104(f). For personnel assigned to the maintenance department, watch augmentation will be based on individual qualifications. For example, an individual who holds both deck and engine qualifying ratings assigned to the maintenance department may be assigned to deck or engine watches. During periods in which these maintenance-persons are used to augment navigational or machinery space watches, they become part of the watch and are subject to successive watch rotation (46 CFR 15.705). Engagement of maintenance-persons with the intention of assigning any individual alternately between deck and engineering watch sections on a routine basis would be considered a violation of 46 U.S.C. 8104(e).

5. Maintenance Department Request. (2014)

A request for implementation of a maintenance department on an inspected vessel will require complete documentation from the vessel's operator describing how such a department will function within the shipboard management arrangements. The request must be made to the OCMI who last certificated the vessel or is currently conducting an inspection for certification. The documentation must include an operating manual for the vessel that describes the structure of the maintenance department, qualifications of the maintenance-persons, the responsibilities and duties of all vessel personnel when the maintenance department concept is implemented, various operating conditions under which personnel would be rotated out of the department (e.g., watchstanding augmentation), and a planned maintenance program. For vessels subject to the ISM Code, this information can be included in a revised section of the Safety Management System and submitted in lieu of a separate operating manual. (Consult Chapter B4 for additional information concerning Maintenance Departments.)

6. Riding Gangs. (2017)

Section 312 of The Coast Guard and Maritime Transportation Act of 2006, Pub. L. 109-241, 120 Stat. 516, added Section 8106 and amended 2101(26a) as well as 8103(j) and 10301(b) of Title 46, United States Code. These sections should be referenced interdependently as they are intended to commonly apply only to U.S. freight vessels on international voyages (H.R. CONF. REP. 109-413, at 70 (2006), as reprinted in 2006 U.S.C.A.N. 579, 592). For vessels subject to 46 USC 8106, MMCs are generally not required by 46 USC 2101(26a), except as provided in the Defense Acquisition Regulations in 48 CFR 212, 247, and 252 (see 76 FR 61279 [October 4, 2011]). The provisions of 46 CFR 15.1105(a), 15.1113(e) & (f) and 33 CFR 104.225 apply to riding gang members. Title 33 CFR 104.265(b) and (c) may apply with regard to TWIC, escorts, and access to secure areas (see 72 FR 3569 [January 25, 2007] for vessels operating in waters outside of

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**

the United States). Security background checks are required by 8106(a)(2)&(5). See MSM Volume V, Part C Chapter 6 for chemical testing and reporting.

Notification of repairs and alterations should be made in accordance with 46 CFR 91.45-1 (Notice Required) and IACS UR Z13 (Voyage Repairs and Maintenance).

For the purposes of 46 USC 8106(f)(1), and in accordance with the procedures established by the Secretary to carry out section 8103(b)(3)(C), the owner or operator should obtain evidence that aliens who are not lawfully admitted for permanent residence are authorized for employment under the Immigration and Nationality Act (INA) and evidence that qualified seamen who are U.S. citizens are not available for employment. The following documentation for H-2B non-immigrants may be considered satisfactory evidence both of authorization for employment with the owner, operator, or employer under the INA and that qualified U.S. citizens or residents are not available:

- a. U.S. Citizenship and Immigration Services (USCIS) Form I-797, "Notice of Action: Approval Notice" classifying the alien as an H-2B non-immigrant for purposes of employment with the owner, operator, or employer; and
- b. If entering the U.S., USCIS Form I-94, "Arrival/Departure Record" indicating that the alien has been lawfully admitted to the United States (or has been lawfully granted a change of nonimmigrant status or extension of non-immigrant stay in H-2B classification) for the dates covered by the proposed employment.

Employment eligibility can be verified by using the USCIS E-Verify system. Citizenship, mariner credentialing and TWIC requirements may apply, as applicable, to individuals engaged to conduct maintenance and repair work onboard all other U.S. vessels including those in domestic coastwise service. This is distinguishable from the kind of work a vendor's technical representative(s), consultant, port engineer/captain, technical superintendant/manager, or a class surveyor would do while the vessel is underway, for a short duration. Exceptions for warranty work are outlined in 46 USC 8106(d).

K. Work Hour Limits (Domestic). (2014, 2017)

(See Chapter B5 of this Volume for related discussion regarding the applicability of STCW requirements for work hours and rest periods.)

1. Tankers.

The Oil Pollution Act of 1990 (OPA 90) amended 46 U.S.C. 8104 by adding a new Subsection (n) which reads as follows: "On a tanker, a licensed individual or seaman may not be permitted to work more than 15 hours in any 24 hour period, or more than 36 hours in any 72-hour period, except in an emergency or a drill. In this subsection, "work" includes any administrative duties associated with the vessel whether performed on board the vessel or onshore."

PART B: VESSEL MANNING**CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING**2. Other Vessels. (2014)

Various sections of 46 U.S.C. 8104 limit the number of hours that credentialed officers and/or crewmembers may be required to work on certain classes of vessels. This does not preclude seamen from voluntarily working beyond those limits and possibly becoming fatigued from excessive hours of overtime. OCMI's should consider all relevant information described in B1.C in establishing required manning levels. While there may be no definitive, scientific basis for a maximum work hour limit for vessel crewmembers, the OCMI has the discretion to impose manning levels based on a specified reasonable work hour limit taking into account fatigue and other human factors. A twelve hour work day, applied in a manner similar to the above work hour limit for tankers, is considered a reasonable work hour limit for other classes of vessels. It is recommended that the OCMI consider this work hour limit in establishing manning levels for non-tankers, adjusting for vessel specific factors that might either alleviate or exacerbate fatigue. Likewise, the OCMI may appropriately consider working conditions and work hour limits established through a collective bargaining agreement in arriving at a final manning determination. (See Chapter B5 of this Volume for additional discussion regarding working conditions.)

3. Enforcement. (2014, 2017)

During inspection activities, Coast Guard personnel shall:

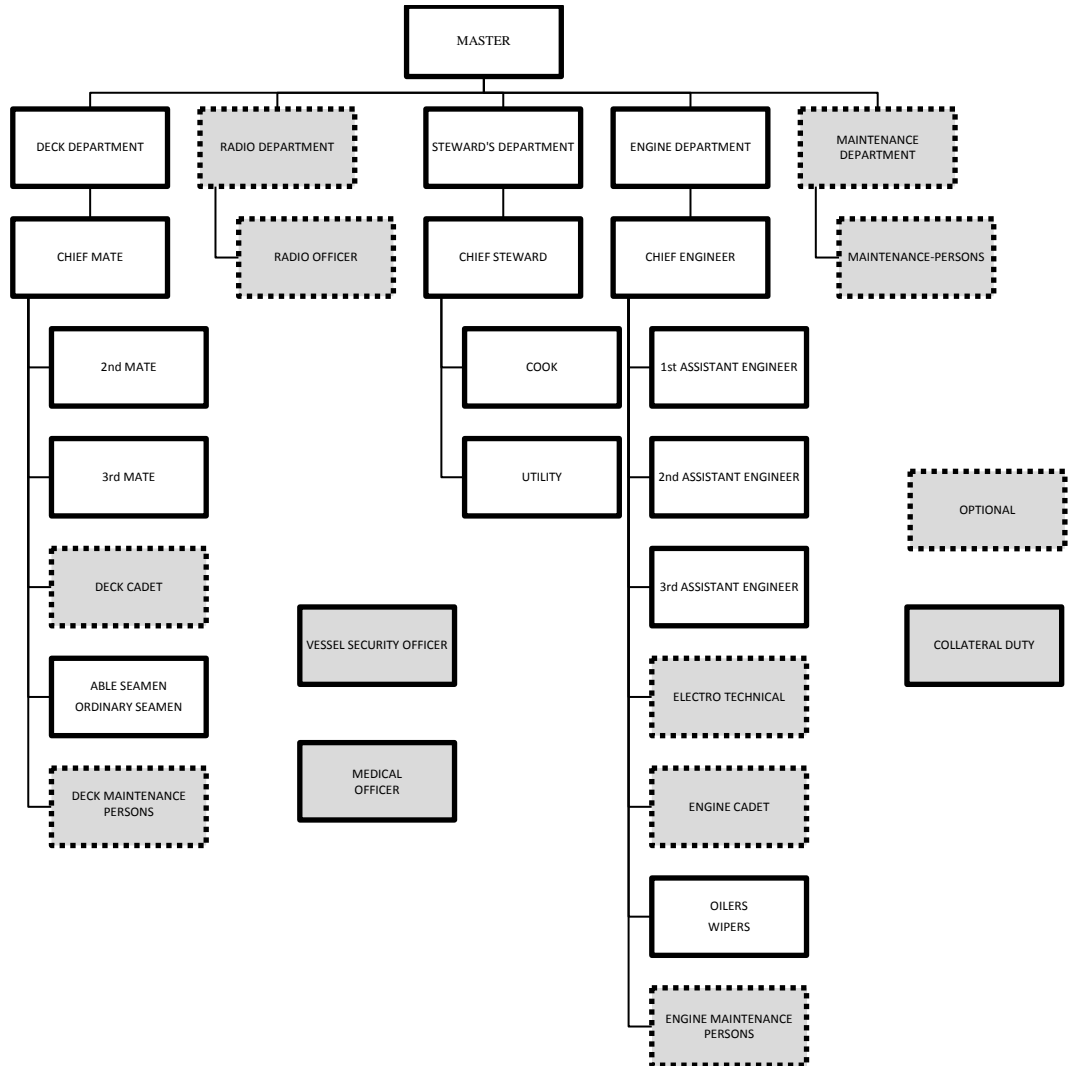

- a. Make general inquiries concerning the working conditions on board the vessel.
- b. Make a specific effort to ascertain whether the vessel's crew is complying with the applicable watchkeeping provisions and rest requirements. A review of vessel logs, maintenance records, and crew interviews with the captain and crew may be conducted at routine vessel inspections to validate adequacy of the manning level to maintain the vessel in safe operating condition. Questions asked during interviews should be framed to elicit objective responses that can be used to ascertain compliance with applicable work and rest requirements.
 - (1) Verify compliance with the applicable watchkeeping requirements, work hour provisions and rest periods while ensuring necessary maintenance has been performed. Should deficiencies be discovered and attributed to insufficient manning, the OCMI should review the previously established minimum safe manning requirements and determine whether the required complement should be modified to ensure that the vessel can be safely operated within the applicable requirements. Any modifications should be discussed with the owner/operator.
 - (2) Ensure that any resultant modifications are reflected on the COI as the minimum required manning.

See Section B5.F.3 for additional discussion on U.S. Coast Guard responsibilities, as well as Sections B6.A.4 and 5 for automated systems.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 1: GENERAL PROVISIONS FOR VESSEL MANNING

L. Shipboard Organization. (2017)

Shipboard organizational structure will vary depending on several factors, including: vessel type, size, service, route as well as company and corporate structure. Nevertheless, the Marine Inspector must have an awareness of the shipboard organization, especially on large complex vessels. Details regarding shipboard organization and responsibilities may be found in the safety management system (ISM Code, Part A/3.2). Consider the following generic organizational chart as an example for a vessel of 1600 GRT or more:

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**A. Introduction. (2014, 2017)

1. Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. Refer to paragraph B1.A for a summary of all Chapters. This Chapter is intended to assist the Officer In Charge, Marine Inspection (OCMI) in the translation of the various statutes, regulations, court decisions, and practices into minimum manning requirements on a vessel's Certificate of Inspection (COI). Sample manning scales are presented below for both general and specific classes of vessels. It must be clearly understood that these scales are stated for conventional (NON-AUTOMATED) vessels, and do not invalidate the basic legal requirements outlined in Chapter B1 of this Volume. The OCMI is not compelled to assign manning levels according to the sample scales presented below, as they are neither mandatory, nor all inclusive. They are representative of specific classes of certificate vessels. The OCMI should consider the manning level recommended by the appropriate scale as a starting point, in conjunction with the manning proposal (Section B1.D), and then determine whether fewer or more personnel are required for the safe operation of the vessel based on local circumstances and other relevant considerations which are spelled out in Section B1.C. Guidance regarding the proper entry of COI manning data is provided in Section A. Chapter 3.H. of the Marine Safety Manual, Volume II. Where manning reductions are requested or contemplated by virtue of vessel automation considerations, the OCMI should also follow the guidance in Chapter B6 of this Volume. Chapter B3 provides supplementary guidance on the manning requirements for credentialed officers. Chapter B4 provides additional guidance on manning requirements for credentialed ratings and non-credentialed crew. Manning of special or unique vessels shall be coordinated with Commandant (CG-CVC). Inquiries and correspondence concerning manning requirements should be directed to Commandant (CG-CVC).

NOTE: For natural gas-fueled vessels, reference CG-OES Policy Letter 01-15: Guidelines for Liquefied Natural Gas Fuel Transfer Operations and Training of Personnel on Vessels Using Natural Gas as Fuel. Specifically, Enclosure (3): Interim Guidance on Training for Mariners on Vessels using Gases or Other Low Flashpoint Fuels until regulations are finalized. (2017)

2. The regulatory text of Title 46 CFR Chapter I, Subchapter B, referenced throughout Part B, Chapters 1-7 of this Volume uses the term “gross tons.” In each relevant instance this term refers to the gross tonnage under the Regulatory Measurement System (GRT), if assigned, and that vessels without an assigned GRT use their gross tonnage under the Convention Measurement System (GT ITC) to apply provisions dependent on “gross tons.”
3. A variable [denoted by (*)] is an additional factor or condition that the OCMI may consider, dependent upon the characteristics of a vessel, as an alternative to the standard number specified in the applicable sample manning scale. Nevertheless, the established manning level must not be less than the minimums stipulated by law or regulation.

 * Denotes variable

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**2. Variables.a. Mates. (2014)

The number of credentialed mates required on inspected oceangoing or coastwise vessels depends on the gross tonnage of the vessel (see 46 U.S.C. 8301 and 46 CFR 15.810). Mates on Great Lakes Vessels must also possess First Class Pilot endorsements, (46 CFR 15.812).

b. Mate/First Class Pilots.

On inland vessels a sufficient number of Mates/First Class Pilots should be provided to divide watchkeeping duties into at least two watches when the vessel operates more than 12 hours in a 24 hour period.

c. Able Seamen (ABs). (2014)

Depending on the size of the vessel and its needs for safe navigation, this number may vary. Except for vessels on rivers or lakes (other than the Great Lakes), at least 65 percent of the deck crew must be ABs (see 46 U.S.C. 8702, 46 CFR 15.840, and Chapter B4).

d. Ordinary Seamen.

This number will vary in proportion to total deck crew.

e. ABs And Ordinary Seamen. (2014)

On ocean or coastwise routes, the number of ABs and ordinary seamen carried must be sufficient for the watch system provisions of 46 U.S.C. 8104 and 46 CFR 15.840. Deckhands may be permitted in lieu of ABs and ordinary seamen on river routes. A specially trained ordinary seaman may be substituted for able seaman in certain situations. If an ordinary seaman receives additional lookout procedure training, it is within the discretion of the local OCMI to allow the substitution of an able seaman with a specially trained ordinary seaman and to amend the COI to reflect the situation. But under no circumstances is the OCMI to amend a COI to reflect a manning scale which contradicts 46 U.S.C. 8702(b), which mandates that 65% of the deck crew shall be an able seaman. Reference Section B4.D.1 for additional information concerning the substitution of able seamen with specially trained ordinary seamen.

f. Certificated Lifeboatmen. (2014)

The number of certificated lifeboatmen must be separately stated on the COI. This number will vary depending on the lifeboat and life raft requirements for each vessel, in accordance with the regulations (see 46 CFR 15.845 and 199.100). There must be a sufficient number of persons certified as lifeboatmen on board the vessel for mustering and assisting untrained persons. There must be a sufficient number of deck officers, able seamen, or persons certificated as lifeboatman on board the vessel to operate the survival craft and launching arrangements required for abandonment by the total number of persons on board. There must be one person placed in charge of each survival craft to be used. The person in charge must be a deck officer, able seaman, or other person certificated as a lifeboatman. The OCMI, considering the nature of the voyage, the number of persons permitted on board, and the characteristics of the vessel, may permit persons practiced in the handling and

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

operation of liferafts or inflatable buoyant apparatus to be placed in charge of liferafts or inflatable buoyant apparatus. There must be a second-in-command designated for each lifeboat. This person should be a deck officer, able seaman, or other person who is certificated as a lifeboatman. For example, the required number of lifeboatmen for a vessel equipped with two lifeboats (one on each side of the vessel) would be four (one primary and one secondary, per lifeboat). Alternatives for passenger vessels in a specified service can be found in 46 CFR 199.630.

- g. Patrolmen. (2014)
The number of patrolmen is determined by the number of patrol routes required to cover all parts of the vessel accessible to passengers or crew, so that each space will be covered at least once every hour from 10 p.m. to 6 a.m. (46 CFR 78.30-10; 46 CFR 15.855).
 - h. Watchmen. (2014)
The number of watchmen is determined by the need to provide a suitable watch to be stationed in the passenger accommodation areas on each deck during the night (46 CFR 78.30-15; 46 CFR 15.855).
 - i. Credentialed Engineers. (2014)
See Chapter B3 of this Volume.
 - j. QMED (Firemen/Watertenders And Oilers). (2014, 2017)
The number and specific ratings will vary based on the number and location of boilers, type of fuel, number of furnaces, arrangement of machinery spaces, type and degree of automation, and (for oceangoing, coastwise, and Great Lakes vessels) the watch provisions of 46 U.S.C. 8104. In the case of motor vessels, no firemen/watertenders are normally required. For vessels not required to carry credentialed personnel in accordance with 46 U.S.C. 8701 and 8702, it is appropriate to include the ratings by name on the COI, followed by "NC" (Not Credentialed).
 - k. GMDSS Radio Operators. (2014)
As discussed in 46 CFR 15.817 every person in the required complement of deck officers, including the master, on seagoing vessels equipped with a GMDSS, except those vessels listed in 46 CFR 15.105(f) and (g), must provide evidence of a valid STCW endorsement as GMDSS radio operator. One of the operators must be designated by the vessel's master as assigned to communicate during a distress situation. Vessels voluntarily relying on the at-sea maintenance provision of the GMDSS must have onboard a licensed GMDSS Radio Maintainer. There is no limitation for who in the crew can be designated to perform this function so long as they are duly certified. Vessels without GMDSS will still require radio officers as determined by the FCC.
3. Passenger Vessel Safety Act of 1993(PVSA), Exemption [46 CFR 70.05-18, 175.118]. (2014, 2017)
All officers must be endorsed for the appropriate vessel tonnage. Specific crewing requirements for vessels exempted under the PVSA can be found in 46 CFR 175.118(c)(3). See Section C. of this Chapter for the Small Passenger Vessel (Under 100 GRT) sample manning scales.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

NOTE: See MSM Volume II Section B.4.CC. for Inspection and Certification of Moored Passenger/Attraction Vessels including Crew Assignments (regardless of tonnage). (2017)

C. Small Passenger Vessels (SPVs) (Under 100 GRT). (2017)

The types, sizes, and operating conditions of small passenger vessels are so varied among the OCMI zones, and within each OCMI zone it would be difficult, if not impossible, to develop a uniform national manning standard for the entire class of vessels. The following manning scales and guidance are provided to assist the OCMI in determining the manning requirements for small passenger vessels. The variations within this vessel class demand the OCMI evaluate each vessel and exercise good judgment in establishing the minimum safe manning. It is emphasized that the OCMI is not compelled to assign manning according to the sample scales in this section as they are neither mandatory, nor all inclusive. The OCMI should consider the manning levels presented as a starting point then determine whether fewer or more personnel are required for the safe operation of the vessel based on local conditions and other considerations noted in Section B1.C. The scales are considered a valid reference that could be quoted to a prospective builder or Small Passenger Vessel (SPV) buyer as a conceptual manning level. See MSM Volume II Section B.4.J. for Boy Scout Vessels, including manning.

1. Sample Scale. (2017)

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Patrolman/ Watchman	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED. (Fireman/Watertender)	QMED. (Others)	Tankermen
General Operations	1 ^[4]	*1 ^[4]	-	-	-	-	*[1,2,3,5]	-	-	-	-	-	-

- [1] One crewmember for each passenger deck.
- [2] Additional deckhands based on number of passengers on board and hours of operations (See table in Section B below).
- [3] See B4.B.1. for additional discussion on the impact of international conventions on certain vessels employing deckhands.
- [4] See B3.I for Federal Pilotage
- [5] Not credentialed
- * Denotes variable

a. Definitions. (2014, 2017)

- (1) Crewmember. A crewmember includes credentialed officers, ratings, and deckhands required by the Certificate of Inspection. Navigating bridge configuration and other local conditions should be considered by the OCMI in determining whether the credentialed officer in charge of the navigating watch is capable of adequately observing and directing passengers on the bridge deck without assistance.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

(2) Passenger Deck. A passenger deck is a level accessible to and used by passengers when the vessel is underway. A portion of a deck used only for passage between levels such as a stairway landing, lobby or vestibule is not a passenger accessible deck for manning purposes. In addition, partial decks may be monitored by a crewmember assigned to a full passenger deck provided the crewmember makes regular rounds of the partial deck.

(3)

b. Table Of Additional Deckhands. (2017)

PASSENGERS ON BOARD	NOT MORE THAN 12 HOUR OPERATION	MORE THAN 12 HOUR OPERATION
0-150	0	1
151-300	1	2
301-500	2	4
501-800	3	6
801 & Up	4	8

See paragraph C.2.b. below for additional deckhand variables.

c. COI Endorsements.

For vessels that carry varying numbers of passengers the OCMI should provide a sliding scale of the total number of deckhands required indicating the number of passengers carried. When preparing the manning section of the COI, the vessel's regular operating hours should be considered. If the operation is more than 12 hours, a determination should be made as to whether there are adequate facilities for the off watch crew to rest. If the vessel's general operation is 12 hours or less, or there are not adequate facilities for the off watch crew to rest during operations of more than 12 hours, the COI should be prepared with a 12 hour crew complement in the manning blocks and the following endorsement under the Route Permitted and Conditions of Operations section of the COI:

IF THE VESSEL IS AWAY FROM THE DOCK, OR PASSENGERS ARE ON BOARD OR HAVE ACCESS TO THE VESSEL FOR A PERIOD EXCEEDING 12 HOURS IN A 24 HOUR PERIOD AN ALTERNATE CREW SHALL BE PROVIDED.

The vessel that routinely operates in excess of 12 hours in a 24 hour period and has adequate facilities for the off watch crew to rest, should be issued a COI with a 24 hour crew in the manning blocks. If the vessel owner uses an alternate crew arrangement then the alternate crew endorsement should be used.

d. High Capacity Small Passenger Vessels. (2014)

The increased size of small passenger vessels has resulted in the carriage of great numbers of passengers and will require manning above the scales listed above. This determination can best be made by the OCMI certifying the vessel based on the vessel's characteristics, route, number of passengers and crew required to successfully

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

respond to all operational and emergency situations. The operation of these high capacity, small passenger vessels on certain routes may call for inclusion of a radar observer endorsement on master and mates credentials.

2. Variables. (2014)

a. Mates. (2014)

The requirement for credentialed mates on vessels of less than 100 GRT is found in 46 CFR 15.810. At least one mate is required on vessels engaged in voyages exceeding 12 hours in duration (see 46 CFR 15.810(b)(5)).

(1) Ocean And Coastwise Routes.

If operational safety is unaffected the OCMI may choose not to require a mate on vessels operating not more than 12 hours in a 24 hour period provided; (1) the number of passengers on board is less than 400, or (2) the vessel accommodates less than 50 overnight passengers.

(2) Great Lakes And Inland Service, And Restricted Routes.

The OCMI may delete the mate on vessels operating not more than 12 hours in a 24 hour period under the same conditions as noted under ocean and coastwise vessels. Additionally, the OCMI having considered all safety issues (e.g., the uniqueness of the operation, crew qualifications, the restrictiveness of the route) may choose not to require a mate regardless of the number of passengers carried.

(3) Less Than 12 Hours. (2014)

A credentialed mate on vessels having voyages of less than 12 hours may be engaged to serve as the senior deckhand. He or she would be available to take over navigational responsibilities and also be present to supervise other operational and emergency concerns.

The above considerations notwithstanding, the mate should be required on all vessels carrying more than 150 passengers and/or having overnight accommodations for more than 49 passengers. A designated senior deckhand may replace the mate provided he or she is qualified under NVIC 1-91, as amended, guidelines. Crewmembers qualified as senior deckhand should be designated in writing by the master with a copy retained on board the vessel. A senior deckhand shall be capable of directing the emergency response actions of the vessel's crew. In the event the master becomes incapacitated, a senior deckhand must be capable of maneuvering the vessel and returning it to a position of safety.

b. Deckhands. (2014)

The authority to determine the complement (number) of deckhands required on small passenger vessels is 46 U.S.C. 8101. The Coast Guard does not prescribe deckhand qualifications. NVIC 1-91, as amended, provides guidance on recommended qualifications and training for deckhands on small passenger vessels.

There should normally be a deckhand assigned for each deck to which passengers have access, except when the master and/or mate of a vessel can adequately observe and direct the passengers on one deck. The OCMI is not compelled to require a

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

deckhand assigned to that same deck to assist the master. The OCMI is not bound to the requirements of Table B2.C.1.b but retains the discretionary authority to assign fewer deckhands, provided that a satisfactory level of operational safety is maintained.

When determining the minimum number of deckhands required the OCMI must consider the following; (1) local circumstances, (2) route, (3) proximity to shore, (4) assistance availability, (5) voyage length, (6) vessel design and construction, (7) crew capabilities, and (8), any other related factors. When applicable, a company's safety record and its training and qualification programs should also be considered in establishing deckhand requirements.

The OCMI must be satisfied that the unlicensed crew is properly trained to perform vessel operations. In general this should be accomplished during the vessel inspection process including the witnessing of performance of emergency drills, the questioning of the crew on duties assigned and/or the review of the company training program. A smaller well trained and qualified crew may be much more capable than a larger number of less qualified deckhands.

The OCMI should consider all variables which are a result of the vessel's design and function, in addition to taking into account an organization's operational structure and policies. For instance, a sailing vessel with extensive rigging or a passenger/cargo vessel using its crew for stevedoring may require additional deckhands. Conversely, certain vessels such as high capacity passenger vessels or vessels operating on restricted routes may require fewer deckhands. If safety remains unaffected, the OCMI may allow a portion or all of the deckhands to perform other duties, such as concessionaire or waiter. These persons must at all times be capable of responding readily to their assigned emergency duties and other deck department related functions. For public health reasons cooks and food handlers should not normally perform or be assigned to deckhand duties.

c. Machinery Operation.

When determining the manning levels for Small Passenger Vessels the OCMI should consider what levels of engineering skills are necessary to operate the vessel safely on its intended route. The OCMI must ensure that owners/operators of Small Passenger Vessels employ someone having a good working operational knowledge of the following; (1) main and auxiliary machinery, (2) steering systems, (3) alarms and monitoring systems, (4) fueling techniques, and (5), emergency procedures. Based on vessel size and engineering complexity, the following levels of engineering expertise should be considered:

(1) Simple Systems.

On vessels with simple engineering systems, it may be necessary that only the master and/or deckhand have these skills.

(2) Complex Systems.

On vessels with more complex engineering systems or vessels that do not carry a

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

mate, deckhands may need special training in routine and emergency engineering tasks.

(3) Main And Auxiliary Systems. (2014)

On vessels with large main and auxiliary engineering systems, multiple decks, extended routes, or other similar conditions, it may be necessary that the OCMI place a requirement on the COI for one or more credentialed engineers (see 46 CFR 15.825(b)). Chapter B3 of this Volume discusses Coast Guard policy for credentialed engineers on vessels of less than 300 GRT.

3. Drills. (2014)

The use of drills is suggested to ensure that manning levels on vessels are sufficient for emergency situations. The vessel master or mate directs the drills; Coast Guard marine inspectors witness and evaluate the drills. In addition, drills should not place the vessel or any crewmembers in jeopardy. Crewmembers should not be allowed to enter the water. Crewmembers should not maneuver the vessel without direct supervision of the master or a credentialed mate.

4. Launches And Water-Taxi Vessels.

Many unusual hazards exist in launch service or water-taxi operations that are not normally encountered by excursion passenger vessels. These hazards are more pronounced on vessels where the master is the only crewmember. Casualty analysis has revealed the following potential hazards of "solo" operation:

a. Debarking Alongside.

The operator is unable to control or assist debarking passengers when alongside an anchored vessel, as he/she must remain at the controls;

b. Intoxicated Passengers.

Persons returning from shore who are under the influence of alcohol may require supervision and assistance. A single operator cannot provide this aid while underway or maneuvering alongside;

c. Language Difficulties.

A foreign passenger may not understand English well and may not be able to alert the operator of an emergency situation or fully understand verbal instructions. A deckhand would be able to assist passengers and visually demonstrate emergency procedures if necessary; and

d. Man Overboard.

It may be extremely difficult for a single operator to maneuver a vessel alongside a person in the water and to recover a person from the water. The OCMI should consider the above hazards when prescribing manning levels for these vessels. The need for a deckhand should be closely evaluated. Commuter type launches and water

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

taxis operating on dedicated runs may not experience all of the above hazards. In certain situations, one-person operation may be acceptable.

5. Alternative Requirements for Vessels Operating Other than a SPV. (2017)

Reference 46 CFR 115.114 & 176.114 for Alternative Requirements for a Vessel Operating as Other than a Small Passenger Vessel. The intent of this provision is to allow an inspected small passenger vessel to operate as an uninspected or recreational vessel by an endorsement in the vessel's COI. A vessel operating under an alternative endorsement must comply with the minimum Manning specified on the COI, which may include reduced Manning based on the type of operation and number of passengers carried (62 FR 51326, 51331). It is recommended that the COI endorsement specify if corresponding MMC endorsements (e.g., OUPV, UFIV) are permitted depending on the type of operation.

D. Passenger-Carrying Barges Under Tow. (2014)

1. General. (2014)

Inspected passenger-carrying barges shall be required to carry a credentialed master, mate and number of able seamen, ordinary seamen, or deckhands. With the exception of credentialed officers, credentialed seamen are not required on inland passenger-carrying barges as provided for in 46 U.S.C. 8701. Unless stated otherwise, many of the principals and terms stated in Section C of this Chapter apply.

2. Dual-Mode Passenger-Carrying Vessel Combinations (Inland Waters). (2014, 2017)

Dual-mode passenger-carrying vessel combinations are those where a towing vessel and a barge are coupled by conventional means and where the operator of the towing vessel navigates the combined units from the towing vessel. Except for navigation, barge operations will be considered as independent of the towing vessel's systems and equipment. It should be noted that the towing vessel could be another passenger vessel, a towing vessel (inspected or uninspected), or another inspected vessel. Nevertheless, manning will be considered separately for each vessel; the towing vessel will be manned for the route and type of operation as appropriate and the barge will be manned as an inspected passenger vessel under the appropriate Subchapter.

a. Dual-mode passenger-carrying vessel combinations, in which an inspected vessel is used as the towing vessel, may be operated by;

- (1) Where the towing vessel is a passenger or other inspected vessel of greater than 200 GRT, masters and mates of inspected vessels of appropriate route and tonnage may operate such vessels with a completed TOAR and 30 or 90 days of familiarization, as appropriate; or,

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

- (2) Where the towing vessel is a passenger or other inspected vessel of 200 GRT or less, masters and mates of towing vessels of an appropriate route OR masters and mates of inspected vessels of appropriate route and tonnage may operate such vessels. Any additional requirements for masters and mates of inspected vessels are to be determined by the local OCMI on a case-by-case.
- b. At the discretion of the OCMI, dual-mode passenger-carrying vessel combinations, in which an uninspected or Subchapter M towing vessel is used, may be operated by;
- (1) Masters and mates of towing vessels of an appropriate route;
 - (2) For towing vessels of greater than 200 GRT, masters and mates of inspected vessels of appropriate route and tonnage may operate such vessels with a completed TOAR and 30 or 90 days of familiarization, as appropriate (see 46 CFR 11.464/11.465); or,
 - (3) For towing vessels of 200 GRT or less, masters and mates of towing vessels of an appropriate route OR masters and mates of inspected vessels of appropriate route and tonnage may operate such vessels. Any additional requirements for masters and mates of inspected vessels are to be determined by the local OCMI on a case-by-case basis.

NOTE: (See 68 FR 1999-6224, 116 [June 17, 2003]). (2014)

0-150	0	1
151-300	1	2
301-500	2	4
501-800	3	6
801 & Up	4	8

See paragraph D.4.c. below for additional deckhand variables.

* **Denotes Variables**

4. Variables.

a. Master. (2014)

On inspected passenger-carrying barges there must be at least one master for the barge credentialed under 46 CFR Part 11. Any required mates will be credentialed under the same section. The credential must be endorsed for the gross tonnage of the passenger-carrying barge. Any credential of comparable tonnage authorizing service on a self-propelled inspected vessel would also satisfy the requirement.

(1) Master In Charge Of Towing Vessel And Passenger-Carrying Barge. (2014)

A master for the passenger-carrying barge may not be required in situations where the OCMI considers that the responsibilities for both the towing vessel and the passenger-carrying barge can be safely vested in one individual on the towing vessel. The passenger-carrying barge's COI must be endorsed to indicate the conditions when a master for the passenger-carrying barge is not required. For combined units (i.e. towing vessel and passenger-carrying barge) with an aggregate tonnage greater than 200 GRT, the COI will also require the master of the combined unit to hold a credential as master of inspected, self-propelled vessels of sufficient scope (e.g. route, aggregate tonnage, TOAR, familiarization) authorizing service on both vessels (see paragraph D.5 of this Chapter below). Alternatively, for the combined unit, the Coast Guard may consider a restricted endorsement under 46 CFR 11.201(1) to satisfy the unique qualification requirements of an applicant or distinct group of mariners. This would require coordination with the OCMI and NMC. The authority granted by this officer endorsement will be restricted to reflect any modifications made under the authority of 46 CFR 11.201(1). The unlicensed towing vessel crewmembers may not be used to satisfy the crew requirements on the passenger-carrying barge.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**b. Mates. (2014, 2017)

The OCMI has discretion to not require a mate on passenger-carrying barges operating not more than 12 hours in a 24 hour period when the passengers on board do not exceed 399, and/or there are overnight accommodations for not more than 49 passengers; or regardless of the number of passengers in any case where, because of the nature of the route, operating conditions, crew qualifications, or other factors the OCMI considers it safe to do so. In determining whether not to require the mate for the 12-hour or less operation, on vessels less than 100 GRT, the OCMI should consider whether there is an assigned senior deckhand as described in the NVIC 1-91, as amended, "Recommended Qualifications For Small Passenger Vessel Deckhands." The senior deckhand should be designated in writing by the master with a copy retained aboard the passenger-carrying barge. The senior deckhand shall be capable of directing the crew in an emergency and assuming the master's responsibilities, if the master becomes incapacitated.

c. Deckhands. (2014)

The criteria in Section B2.D.2 should be used as a guide in determining the number of deckhands required. Passenger-carrying barges of unique design or restricted operations may require different manning scales. In addition, the method of towing may indicate a different requirement for the number of deckhands. The OCMI will provide on the COI a sliding scale detailing the deckhand requirements for barges that carry varying numbers of passengers. The number of deckhands required will be based on the number of decks and passengers carried. Paragraph C.2.b of this Chapter may be referenced for a more detailed discussion.

d. Multiple Passenger-Carrying Barge Combinations. (2014)

For multiple passenger-carrying barge combinations an OCMI may assign manning scales based on the separate units or as a single scale for the combined unit. In some cases it may not be necessary or practical to have a separate crew for each passenger-carrying barge. When assigning one crew to a multiple passenger-carrying barge combination, the OCMI should ensure that there is at least one crewmember for each passenger-carrying barge when the tow is underway, and sufficient crewmembers for a roving patrol whenever the tow is docked with passengers on board.

e. Machinery Operation. (2014)

Passenger-carrying barges under tow should not be operated unless some member of the crew has a good working knowledge of the operation and use of the auxiliary machinery, alarms, electrical systems, and emergency procedures. The OCMI must ensure that the owners/operators crew the vessels with individuals having these qualifications. In most cases the master of the barge or a properly trained deckhand would meet this requirement.

PART B: VESSEL MANNING

CHAPTER 2: SAMPLE VESSEL MANNING SCALES

5. Push-Mode Passenger-Carrying Integrated Towing Vessel-Barge Combinations (ITB) (Inland Waters). (2014, 2017)

Push-mode passenger-carrying integrated towing vessel-barge combinations are those in which a specially designed propulsion unit (towing vessel) is mated to the passenger-carrying barge. The navigation and operation of the combined unit can be accomplished from a control station located on the passenger-carrying barge. The barge cannot operate independently of the towing vessel, which provides its power and other passenger services. These push-mode passenger-carrying ITB combinations are designed, outfitted and intended to operate as a single unit and therefore will be manned as a single vessel. The master and mates must hold inspected vessel credentials with tonnage limitations appropriate to the aggregate tonnage of the towing vessel and barge combination (see NVIC 2-81, as amended). Masters and mates of inspected vessels greater than 200 GRT may operate such vessels with a completed TOAR and 30 or 90 days of familiarization, as appropriate (see 46 CFR 11.464/465). The rare scenario of a push-mode passenger-carrying integrated towing vessel-barge combination of 200 GRT or less is best handled by the local OCMI on a case-by-case.

Combined Unit.

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Patrolman/ Watchman	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/ Watertender)	QMED (Oilers)	Tankermen
General Operations	1	*1	-	-	-	-	* [1,2,3,4]	-	-	-	-	-	-

- [1] One deckhand for each passenger deck.
- [2] Additional deckhands based on number of passengers on board and hours of operations (See table in Section B2.D.3 above).
- [3] See B4.B.1. for additional discussion on the impact of international conventions on certain vessels employing deckhands.
- [4] Not credentialed
- * Denotes variable. Variables described in Section B2.D.4 above may be generally applied to these integrated towing vessel-barge combinations.

As the statutory and regulatory requirements for push-mode ITBs are based on the aggregate tonnage of the combination, vessels of this class could equal or exceed 1,600 GRT. Accordingly, the OCMI may reference Section G.1 of this Chapter or any other section for manning levels consistent with a conventional vessel of the same tonnage, route, and service.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**6. COI Endorsements. (2014)

In preparing the manning section of the COI, the regular operation of the passenger-carrying barge should be reviewed to determine whether the operation is more than 12 hours. If the operation is more than 12 hours, a determination should be made as to whether there are adequate facilities for the off watch crew to rest. On vessels where there are no adequate facilities for the off watch crew to rest, and on vessels that generally operate less than 12 hours, the COI should be prepared with a 12 hour crew in the manning blocks and the following endorsements:

IF THE VESSEL IS AWAY FROM THE DOCK, OR PASSENGERS ARE ON BOARD OR HAVE ACCESS TO THE VESSEL FOR A PERIOD EXCEEDING 12 HOURS IN A 24 HOUR PERIOD AN ALTERNATE CREW SHALL BE PROVIDED."

The COI on passenger-carrying barges that routinely operate in excess of 12 hours in a 24 hour period, and have adequate facilities for the off watch crew to rest, should be prepared with a 24 hour crew in the manning blocks unless the passenger-carrying barge owner requests to use an alternate crew arrangement. In this case the 12 hour alternate crew endorsement above should be used.

NOTE: If these vessels exceed 100 GRT and are on a voyage of over 600 nautical miles, they must comply with the requirements of 46 U.S.C. 8104(d). (2014)

7. Seagoing Passenger-Carrying Barges. (2014)

The manning and qualifications requirements for seagoing passenger-carrying barges will be handled on an individual basis. The OCMI will submit proposed manning for these vessels to Commandant (CG-CVC) for review. Insofar as practical, the required manning for these vessels should parallel that of inland vessels of similar tonnage, passenger capacity, and configuration. Special emphasis must be placed on ability of the crew to handle emergencies, control and care for passengers, and use all required lifesaving equipment.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

E. Mechanically-Propelled Cargo/Tank Vessels Of 100 GRT Or More. (2014)

1. General. (2014)

Tank vessel manning standards are required by 46 U.S.C. 9102 to take into account a number of factors relating to the duties, qualifications, and training of officers and crew. These factors include standards related to vessel navigation, cargo handling, size and type of vessel, qualification by virtue of simulator training, maintenance functions, physical fitness criteria, as well as retraining and special training requirements. Section B1.C also addresses specific factors to be considered in manning determinations.

2. Sample Scales. (2017)

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED. (Fireman/Watertender) ¹³	QMED. (Others)	Tankermen
Oceans/ Coastwise/ Great Lakes ≥1,000 GRT ≥400 Miles	1 ^[3]	*3 ^[1,3]	*6 ^[5]	*3 ^[5]	*[4]	*[8]	*1	*3 ^[2, 12]	*3 ^[6, 12]	*3 ^[6, 12]	*3 ^[7,11]
Oceans/ Coastwise/ Great Lakes ≥1,000 GRT <400 Miles	1 ^[3]	*2 ^[1,3]	*6 ^[5]	*3 ^[5]	*[4]	*[8]	*1	*3 ^[2, 12]	*3 ^[6, 12]	*3 ^[6, 12]	*3 ^[7,11]
Oceans/ Coastwise/ Great Lakes <1,000 GRT ≥100 Miles	1 ^[3]	*2 ^[1,3]	*6 ^[5]	*3 ^[5]	*[4]	*[8]	*1	*3 ^[2, 12]	*3 ^[6, 12]	*3 ^[6, 12]	*3 ^[7,11]
Oceans/ Coastwise/ Great Lakes <200 GRT ≥100 Miles ≤24 Hours	1 ^[3]	*1 ^[1,3]	*6 ^[5]	*3 ^[5]	*[4]	*[8]	*1	*3 ^[2, 12]	*3 ^[6, 12]	*3 ^[6, 12]	*3 ^[7,11]
Lakes, Bays & Sounds ^[9]	1	*1 ^[1]	*4 ^[5]	*2 ^[5]	-	*[8]	*1	*1 ^[2, 12]	*2 ^[6, 12]	*2 ^[6, 12]	*2 ^[7]
Lakes, Bays & Sounds ^[9,10]	1	*1 ^[1]	*2 ^[5]	*1 ^[5]	-	*[8]	*1	-	*1 ^[6, 12]	*1 ^[6, 12]	*1 ^[7]

 [13] Steam propulsion
 * Denotes variable

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**3. Variables.a. Work Hour Limits. (2014)

46 U.S.C. 8104(n) imposes maximum work hour limits for credentialed individuals and seamen on tankers. All tankers must ensure compliance with this provision.

b. Mates. (2014)

The number of credentialed mates required specifically by statute or regulation on oceangoing or coastwise vessels generally depends on the gross tonnage of the vessel (see 46 U.S.C. 8301 and 46 CFR 15.810). The work hour limitations may necessitate an additional mate be assigned to prevent the chief mate from exceeding limits due to cargo handling responsibilities.

c. Able Seamen (ABs). (2014)

Depending on the size and operation of a vessel and its needs for safe navigation, this number may vary. On certain vessels, sixty-five percent of unlicensed deck crew must be ABs (see 46 U.S.C. 8702, 46 CFR 15.840, and Chapter B4).

d. Ordinary Seamen.

This number will vary in proportion to the total deck crew.

e. ABs And Ordinary Seamen.

On oceangoing and coastwise vessels over 100 GRT, the number of ABs and ordinary seamen carried must be sufficient for the watch provisions of 46 U.S.C. 8104 and 46 CFR 15.705. Deckhands may be permitted on vessels restricted to inland routes.

f. Certificated Lifeboatmen.

The number of certificated lifeboatmen must be separately stated on the COI. The number will vary depending on the lifesaving equipment requirements for each vessel.

g. Credentialed Engineers. (2014)

See Chapter B3 of this Volume.

h. QMED (Firemen/Watertenders And Oilers). (2014)

The number and specific ratings will vary based on the number and location of boilers, type of fuel, number of furnaces, arrangement of machinery spaces, type and amount of automation, and, for oceangoing, coastwise, and Great Lakes vessels, the watch provisions of 46 U.S.C. 8104. In the case of motor vessels, no firemen/watertenders are normally required. Vessels operating exclusively on river routes are not required to carry credentialed personnel (see 46 U.S.C. 8701 and 8702), but it is appropriate to include the ratings by name on the COI followed by "NC" (Not Credentialed). Refer to Chapter B4 also.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**i. GMDSS Radio Operators. (2014)

As discussed in 46 CFR 15.817 every person in the required complement of deck officers, including the master, on seagoing vessels equipped with a GMDSS, except those vessels listed in 46 CFR 15.105(f) and (g), must provide evidence of a valid STCW endorsement as GMDSS radio operator. One of the operators must be designated by the vessel's master as assigned to communicate during a distress situation. Vessels voluntarily relying on the at-sea maintenance provision of the GMDSS must have onboard a licensed GMDSS Radio Maintainer. Vessels without GMDSS will still require radio officers as determined by the FCC.

j. Tankermen. (2014, 2017)

The OCMI enters, on the COI issued to each manned tank vessel subject to the regulations in 46 CFR, the number of crewmembers required to hold valid merchant mariners' documents or MMCs with the proper tankerman endorsement. Title 46 CFR, Table 15.860(a)(1) provides the minimal requirements for tankermen aboard manned tank vessels; Table 15.860(a)(2) provides the tankerman endorsements required for personnel aboard tankships. Generally, tankermen are required aboard all vessels to which 46 U.S.C. Chapter 37 applies that carry oil or hazardous materials in bulk as cargo or residue (see 46 U.S.C. 8703). Vessels described in 46 U.S.C. 3702(b) have been provided an alternative in 46 U.S.C. 8703(c). In consideration of footnote 5 in 46 CFR Table 30.01-5(d), vessels covered by Subchapter H (Passenger Vessels) or I (Cargo and Miscellaneous Vessels) of 46 CFR Chapter I, where the principal purpose or use of the vessel is not for the carriage of liquid cargo, may be granted a permit to carry a limited amount of flammable or combustible liquid cargo in bulk. The portion of the vessel used for the carriage of the flammable or combustible liquid cargo must meet the requirements of Subchapter D (Tank Vessels) in addition to the requirements of Subchapter H (Passenger Vessels) or I (Cargo and Miscellaneous Vessels). As indicated in 46 CFR 31.15-1, this includes the applicable manning provisions relating to tankermen endorsements required for personnel aboard tank vessels.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING

[4] Not credentialed
* Denotes variable

2. Variables.

a. Work Hour Limits. (2014)

46 U.S.C. 8104(n) imposes maximum work hour limits for credentialed individuals and seamen on tankers. The person in charge of transfer operations on tank vessels with a cargo capacity of 250 barrels or more must be a credentialed engineer, pilot, or master/mate authorized for service on vessels of more than 200 GRT (33 CFR 155.710(a)). The number of credentialed officers required must account for this additional responsibility. The work hour limits prevail over another statute which may allow a specific number of designated crew.

b. Deckhands.

Due to the number of variables in the operation of this type of vessel, the specific deckhand requirements are left to the discretion of the certificating OCMI.

c. Tankermen. (2014, 2017)

The OCMI enters, on the COI issued to each manned tank vessel subject to the regulations in 46 CFR, the number of crewmembers required to hold valid MMCs with the proper tankerman endorsement. Title 46 CFR, Table 15.860(a)(1) provides the minimal requirements for tankermen aboard manned tank vessels; Table 15.860(a)(2) provides the tankerman endorsements required for personnel aboard tankships. Generally, tankermen are required aboard all vessels to which 46 U.S.C. Chapter 37 applies that carry oil or hazardous materials in bulk as cargo or residue (see 46 U.S.C. 8703). Vessels described in 46 U.S.C. 3702(b) have been provided an alternative in 46 U.S.C. 8703(c). In consideration of footnote 5 in 46 CFR Table

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

30.01-5(d), vessels covered by Subchapter H (Passenger Vessels) or I (Cargo and Miscellaneous Vessels) of 46 CFR Chapter I, where the principal purpose or use of the vessel is not for the carriage of liquid cargo, may be granted a permit to carry a limited amount of flammable or combustible liquid cargo in bulk. The portion of the vessel used for the carriage of the flammable or combustible liquid cargo must meet the requirements of Subchapter D (Tank Vessels) in addition to the requirements of Subchapter H (Passenger Vessels) or I (Cargo and Miscellaneous Vessels). As indicated in 46 CFR 31.15-1, this includes the applicable manning provisions relating to tankermen endorsements required for personnel aboard tank vessels.

G. Seagoing Motor Towing Vessels (> 300 GRT) And Integrated Tug-Barges (ITBs) [Refer to NVIC 2-81, as amended]. (2014, 2017)

1. Seagoing Motor Towing Vessels (> 300 GRT) And Dual-Mode Integrated Tug-Barges (ITBs) [commonly referred to as Articulated Tug-Barges (ATBs)].

Seagoing Motor Towing Vessels (> 300 GRT) are subject to the provisions of 46 U.S.C. 8101, 8104, 8301 (and, depending upon the size or route, 46 U.S.C. 8304, 8701, and 8702). It should be noted that the number of mates required by 46 U.S.C. 8301 must be read as complementary to, not dependent upon, the watch provisions of 46 U.S.C. 8104 (see Chief Counsel opinion #9786 in Law Bulletin #368, October 1966, cited in Marine Laws; Navigation and Safety, Volume 1, Edition 2, by F. Arzt, published 1963, p. 214). Should the voyage equal or exceed 600 miles, the master must also be in a watchstanding status.

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Water tender)	QMED (Officers)	Tankermen
General Operations	1 ^[2,4]	*2 ^[1,2,4]	*4 ^[6]	*2 ^[6]	*[5]	-	*[8]	1	*2 ^[3, 9]	-	*3 ^[7, 9]	-

 [6] See B4.D for Deck Department Ratings
 [7] See B4.E for Engine Department Ratings
 [8] See 46 CFR 15.404(e) and (g) for Lifeboatmen. See also B2.B.2.f for general discussion.
 [9] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.
 * Denotes variable

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART B: VESSEL MANNING

CHAPTER 2: SAMPLE VESSEL MANNING SCALES

NOTE 1: In many cases Articulated Tug-Barges (ATBs) are treated as two separate units (non integral). If the tug of a dual-mode unit is a seagoing motor vessel (> 300 GRT) then paragraph G.1 is applicable. If the tug of a dual-mode unit is not, then refer to paragraph B7.B. If the unit is push-mode, refer to paragraph G.2 below. For Subchapter M towing vessels see paragraph B2.W. (2014, 2017)

NOTE 2: For additional information concerning the conditional occupancy of unmanned barges forming part of an ATB combination, see CG-CVC Policy Letter 16-04. (2017)

2. Push-Mode ITBs. (2017)

Inspected push-mode ITBs are subject to the provisions of 46 U.S.C. Chapter 37 (if applicable), 8101, 8104, 8301, 8303, 8304, 8701, and 8702. As statutory and regulatory requirements for push-mode ITBs are based on the aggregate tonnage of the combination, virtually all vessels of this class will equal or exceed 1,600 GRT.

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Water tender)	QMED (Oilers)	Tankermen
General Operations	1 ^[2,4]	*3 ^[1,2,4]	*6 ^[6]	-	*[5]	-	*[9]	1	*2 ^[3, 10]	-	*3 ^[7, 10]	*3 ^[8]

- [1] See B3.D for Mate computations and COI formatting
 - [2] See B3.G for Towing Endorsements
 - [3] See B3.F for Engineer computations and COI formatting
 - [4] See B3.I for Federal Pilotage
 - [5] See B3.L for Radio Officers and GMDSS
 - [6] See B4.D for Deck Department Ratings
 - [7] See B4.E for Engine Department Ratings
 - [8] See 46 CFR 15.860 for Tankermen
 - [9] See 46 CFR 15.404(e) and (g) for Lifeboatmen. See also B2.B.2.f for general discussion.
 - [10] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.
- * Denotes variable

3. Variables.

a. First Class Pilot.

Master and mates must have FCP endorsements when navigating exclusively on the Great Lakes. In addition, when navigating on designated waters, the vessel must have a United States or Canadian registered pilot for the route being navigated. (46 U.S.C. 9302)

b. Mates. (2014)

If the gross tonnage of the tug in a Dual-Mode ITB or the combined tonnage of the Push-Mode ITB exceed 1,000 GRT then three mates are required on voyages of 400 miles or more (46 U.S.C. 8301).

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

- c. Engineers. (2014)
Most of these vessels are highly automated and the manning levels indicated may be reduced. Refer to Chapter B6.
- d. Able Seamen (ABs). (2014)
On oceangoing and Great Lakes vessels, the number of ABs and ordinary seamen carried must be sufficient for the watch provisions of 46 U.S.C. 8104 and 46 CFR 15.705. Two specially trained ordinary seaman may be substituted for a maximum of two able seamen. However, the provisions of 46 U.S.C. 8702(b) shall be met. See Chapter B4.
- e. GMDSS Radio Operators. (2014)
As discussed in 46 CFR 15.817 every person in the required complement of deck officers, including the master, on seagoing vessels equipped with a GMDSS, except those vessels listed in 46 CFR 15.105(f) and (g), must provide evidence of a valid STCW endorsement as GMDSS radio operator. One of the operators must be designated by the vessel's master as assigned to communicate during a distress situation. Vessels voluntarily relying on the at-sea maintenance provision of the GMDSS must have onboard a licensed GMDSS Radio Maintainer. Vessels without GMDSS will still require radio officers as determined by the FCC.
-

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

H. Cargo And Miscellaneous Barges.

1. Seagoing Barges. (2017)

a. General.

The determination as to whether or not a seagoing barge must be manned shall be made by the OCMI (see 46 CFR 15.801). These vessels must comply with the watch provisions of 46 U.S.C. 8104 when the manning levels prescribed are based on safety considerations. In this regard, the duties of riding personnel should include periodic checks of the towing gear, security of cargo, navigation lights, etc. These are safety-oriented functions amenable to a watch routine, as opposed to maintenance functions such as painting.

b. OCMI's Evaluation.

Should the OCMI decide that safety is the primary task of the riding crew, the number of personnel in the deck department shall be sufficient to meet the watch system requirements of 46 U.S.C. 8104 (two watches for voyages of less than 600 nautical miles, three watches for voyages of 600 nautical miles or more). In all such cases, the deck crew must be composed of at least 65 percent ABs, as required by 46 U.S.C. 8702.

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED. (Fireman/Watertender)	QMED. (Others)	Tankermen
Voyages of Less than 600 NM ^[3]	-	-	2 ^[1,2]	-	-	-	-	-	-	-	-	_[2]
Voyages of 600 NM or More ^[3]	-	-	2 ^[1,2]	1 ^[1]	-	-	-	-	-	-	-	_[2]
<p>[1] See B4.D for Deck Department Ratings</p> <p>[2] One of the crew must hold an appropriate tankerman endorsement (aboard tank barges only).</p> <p>[3] Other persons may be permitted, depending on the berthing accommodations and lifesaving devices available aboard the barge.</p>												

2. Dump Scows And Non-Self-Propelled Harbor Dredges, And Barges Changing Places Of Employment Beyond The Baseline.

a. Required Manning.

Certain barges may be unmanned if so authorized by the OCMI. However, if a crew is required by the OCMI:

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**(1) Crewmembers. (2014)

All crewmembers must possess a merchant mariner credential (MMC) and be divided among required watches.

(2) Unlicensed Deck Crew. (2014)

Sixty-five percent of the deck department, exclusive of credentialed officers personnel, must be ABs.

b. Permitted Manning.

When the OCMI does not deem it necessary to require a crew on subject barges, a crew may still be permitted, and in such cases:

(1) Maintenance Persons.

Barges may carry a person or persons as maintenance men with no duties connected with the navigation of the vessel. A sample endorsement that may be used on the COI:

CERTIFICATED WITHOUT A NAVIGATING CREW. THE VESSEL MAY CARRY ONE PERSON AS MAINTENANCE MAN AND OPERATOR OF THE DUMPING MECHANISM, WITH NO DUTIES CONNECTED WITH THE NAVIGATION OF THE VESSEL.

(2) Citizenship.

Seventy-five percent of the personnel of this "permitted" crew must be U.S. citizens; and

(3) MMC Requirement. (2014)

All crewmembers must be in possession of MMCs.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

I. Public Vessels. (2017)

Reference MSM Volume II, Section B Chapter 5 as well as any applicable interagency agreement (MOU/MOA) for general policy regarding Public Vessels.

1. Army Corps Of Engineers (USACE) Vessels. (2014, 2017)

The manning requirements for inspected USACE vessels are stated on the COI, in the same manner as for other inspected vessels. Inspected USACE dredges are certificated for service on various routes and manned accordingly. Hopper dredges often operate for extended periods in protected waters, entering exposed waters only to change operating sites or to dump spoil. It is the USACE's policy to allow as many crewmembers on liberty as feasible when the vessel is engaged in dredging operations of this type. Accordingly, the COI should be endorsed to provide for a minimal crew while the vessel is dredging or dumping. This will permit the vessel to make short voyages, less than two watch rotations, for dumping purposes with a reduced crew aboard. The scales are provided below, as appropriate:

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Water tender) ⁹	QMED (Others)	Tankermen
Great Lakes	1	1 ^[1]	2 ^[4]	1 ^[4]	* ^[3]	-	* ^[6]	1	*1 ^[2, 8]	*1 ^[5, 8]	1 ^[5, 8]	-
Lakes, Bays, Sounds & Rivers ^[7]	1	1 ^[1]	2 ^[4]	1 ^[4]	-	-	* ^[6]	1	*1 ^[2, 8]	*1 ^[5, 8]	1 ^[5, 8]	-

 [5] See B4.E for Engine Department Ratings
 [6] See 46 CFR 15.404(e) and (g) for Lifeboatmen. See also B2.B.2.f for general discussion.
 [7] Except Great Lakes
 [8] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.
 [9] Steam propulsion
 * Denotes variable

2. Military Sealift Command (MSC) Vessels. (2014)

These vessels are typically civilian-manned. Manning should be established using Section B2.E as a guide. In addition, the OCMI should consult Volume II, Section B Chapter 5 of this manual and any MOA in force between the USCG and MSC.

3. National Oceanic and Atmospheric Administration (NOAA) Vessels. (2017)

Contact Commandant (CG-CVC-1) for guidance if requested to issue a SMD to a NOAA vessel.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**4. Other Vessels (Non-Federal). (2017)

Generally, state or municipal vessels are not considered "public vessels" as defined by 46 USC 2101 (24). However, vessels owned or operated by state or municipal governments, which are engaged in law enforcement or other government sanctioned public safety activities, may not be required to have a Coast Guard credentialed master by 46 CFR 15.805 because they are not subject to documentation or inspection while engaged in an official capacity. Although, a credential may be a state or municipal condition of employment.

J. School Vessels Operated By The U.S. Merchant Marine/State Maritime Academies (SMA).1. Mechanically-Propelled Vessels Of 100 GRT Or More. (2014, 2017)

The COI shall specify the minimum complement of officers and crew necessary for the safe navigation of a school vessel (46 CFR 167.60-15). Unless expressly authorized and alternatively endorsed, cadets are not authorized to fill any other position required by the COI. Certain academy training programs have been approved under 46 CFR 10.407 to allow cadets to qualify for rating endorsements restricted to service on the academy's training ship. In these specific cases, the cadets will be issued an MMC, endorsed to reflect the rating in accordance with the program approval. In this situation, the cadet's may fill the position of the COI for the academy training ship. Cadets may be at the helm as part of the training ship experience provided they are under the supervision of a qualified member of the crew. Specific information is listed under paragraph b. below. The following guidelines are offered to promote uniform manning levels for school vessels. However, the OCMI shall exercise discretion, within the minimum requirements of the law, in this regard, particularly for smaller vessels operating on limited routes. See MARAD MOU.

a. Credentialed Officers. (2014, 2017)

One master, three mates, one chief engineer, three assistant engineers, and one radio officer, as applicable (see 46 CFR 310.5 concerning state training ships). For vessels operated exclusively in Great Lakes service, a master/first class pilot and first class pilots shall be employed in lieu of mates.

b. Deck Crew. (2017)

The COI should reflect a sufficient number of ABs (generally 3 in total, one available to supplement each watch). Ratings in the deck department are assigned to assist the officer in charge of the watch, to respond in an emergency, and to fulfill associated statutory requirements (see 46 U.S.C. 8702). An officer with a valid MMC, carried in excess of those required by the COI, may fill a rating billet required by the COI so long as there is no conflict with other manning provisions. Cadets may be at the helm as part of the training ship experience provided they are under the supervision of a qualified member of the crew. When deemed appropriate by the master, cadets may be at the wheel. During periods prescribed by 46 USC 8702 the cadet must be under the direct observation of an individual qualified as AB other than the mate (OICNW) on watch.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**c. Engine Room Personnel. (2017)

The COI should reflect a minimum of three firemen/watertenders or oilers (one per watch). Ratings in the engine department are assigned to assist the officer in charge of the engine watch, to respond in an emergency, and to fulfill associated statutory requirements.

d. Lookouts. (2017)

For vessels to which STCW applies an individual serving as lookout must hold an endorsement as Rating Forming Part of a navigational Watch (RFPNW), except for those in training (46 CFR 15.1103(b)).

e. Lifeboatmen. (2014, 2017)

The requirements of 46 CFR 199.100 shall be fully met. Cadets may fill the billets for lifeboatmen, provided they hold an endorsement for lifeboatman and the corresponding STCW endorsement for Proficiency in Survival Craft.

2. School Vessels Under 100 GRT. (2014)

See Chapter B3 of this Volume.

K. Sailing School Vessels. (2014)

Sailing school vessels must operate with properly credentialed and certificated individuals, as required by statutes and regulations. These individuals provide the necessary base of experience to fulfill leadership roles during emergencies, and to otherwise assure the vessel's safe handling.

1. OCMI Considerations.

In determining the manning needed to safely operate the vessel, the OCMI shall take into consideration the vessel's route and specific characteristics, including the number of masts, type of sails, and number of persons needed for evolutions. Vessels equipped with more than one mast must carry a seaman (AB or deckhand, as appropriate) for each mast, and an additional AB for each square-rigged mast. On ketches and yawls where the second mast is used for balancing purposes, the OCMI may waive the additional seaman, if it is believed that the vessel can be operated with a smaller crew.

2. Deck Crew. (2014)

The maximum number of people needed in the deck crew will be figured as noted above, or as required by watchkeeping requirements, whichever is greater. On vessels 100 GRT and above, except those navigating exclusively on rivers or lakes (except the Great Lakes), the unlicensed crew must hold credentials and at least 65 percent must be endorsed as ABs. If propelling machinery is installed aboard seagoing sailing school vessels of 300 GRT or more, a credentialed engineer must be carried. On ocean or coastwise or Great Lakes vessels of 100 GRT or more, the 3-watch standard applies.

NOTE: Liftboats are required to maintain a full crew as required by the COI while operating. Liftboats are considered to be operating both while underway and elevated. (2017)

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**3. Variables.a. Engineers. (2014, 2017)

Number of engineering personnel dependent on level of automation. See below. A designated duty engineer (DDE) can serve as a Chief or Assistant Engineer, subject to the restrictions of their endorsement, on vessels of not more than 500 GRT.

- (1) OSVs less than 6,000 GT ITC (500 GRT if no GT ITC): 46 CFR Subchapter L, Part 130 Subpart D, Chapter B6 and NVIC 1-78 (as amended). See also D8(m) Policy Letter 01-2004.
- (2) OSVs of 6,000 GT ITC (500 GRT if no GT ITC): 46 CFR Subchapter F, Parts 61 & 62 and Chapter B6. See also 46 CFR 15.825(c).

b. Tankermen. (2014, 2017)

Generally, tankermen are required aboard all vessels to which 46 U.S.C. Chapter 37 applies that carry oil or hazardous materials in bulk as cargo or residue (see 46 U.S.C. 8703). Vessels described in 46 U.S.C. 3702(b) have been provided an alternative in 46 U.S.C. 8703(c). However, the following are additional factors to be considered with OSVs depending on the quantity and type of materials carried.

- (1) OSVs with a capacity of at least 250 barrels oil or hazardous material in bulk (e.g., oil based drilling mud) within cargo tanks or portable tanks must have a credentialed master, mate, engineer, or pilot as the person in charge of transfer operations.
- (2) OSVs which do not carry oil or hazardous materials in bulk as cargo, but carry fuel within the fuel supply tanks for transfer to an offshore facility may have either a certified tankerman or a credentialed master, mate, pilot or engineer as the person in charge of transfer operations.
- (3) OSVs with a cargo capacity exceeding 20 percent of its deadweight tonnage are considered tankers and must meet the more stringent manning scales in Sections B2.E or B2.F.

c. Able Seamen (ABs). (2014, 2017)

The OCMI may consider allowing specially trained ordinary seaman (OS) meeting the requirements of NVIC 3-83 as substitutes for up to 35 or 50 percent, respectively, of the required ABs on domestic voyages as provided by 46 USC 8702(b)(2) (see Chapter B4). Reference Section B.1.a.(3) of Chapter B4 for additional information concerning the substitution of able seamen with specially trained ordinary seamen on voyages subject to STCW. The OCMI should consider additional personnel for specific activities and operations (e.g., helo, FRAC, number of offshore workers, etc.). In doing so, the OCMI should reference Chapter B1.C - E.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

M. Oil Spill Response Vessels (OSRVs).

1. General. (2017)

It is expected that many OSRVs will be converted Offshore Supply Vessels (OSVs). OSVs manning scales are not considered appropriate for this new class of vessels. OSRVs will require a 24-hour day capability when engaged in spill response. OSRVs are technically tankers, as defined by 46 U.S.C. 2101(38), and therefore are subject to the work hour limitations imposed by 46 U.S.C. 8104(n). Existing automated OSVs being converted to OSRVs shall be reevaluated for a determination of appropriate manning levels. Manning reductions based on automation shall be handled according to existing regulations and policies. The sample scales below are stated for conventional (non-automated) Oil Spill Recovery Vessels in restricted ocean service; vessels limited to inland routes could have reduced manning levels provided work hour limitations are not exceeded. See CG-CVC Policy Letter 12-03 for OSVs as OSRVs and tonnage alternative. Upon request, additional consideration may be afforded for reduced operational manning during the initial response operation or a training exercise of less than 16 hours in duration.

2. Sample Scales. (2014, 2017)

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Watertender)	QMED (Others)	Tankermen
≥500 GRT	These vessels should be manned similarly to a tank vessel (see Section B2.E.1).											
<500 ≥100 GRT	1 ^[3]	*2 ^[1,3]	*3 ^[5]	-	*[4]	-	*[8]	*1	*2 ^[2, 11]	-	*3 ^[6, 11]	*2 ^[7]
<100 GRT	1 ^[3]	*1 ^[1,3]	-	-	*[4]	2 ^[9,10]	-	-	-	-	-	*2 ^[7]

[1] See B3.D for Mate computations and COI formatting
 [2] See B3.F for Engineer computations and COI formatting
 [3] See B3.I for Federal Pilotage
 [4] See B3.L for Radio Officers and GMDSS
 [5] See B4.D for Deck Department Ratings
 [6] See B4.E for Engine Department Ratings
 [7] See 46 CFR 15.860 for Tankermen
 [8] See 46 CFR 15.404(e) and (g) for Lifeboatmen. See also B2.B.2.f for general discussion.
 [9] See B4.B.1. for additional discussion on the impact of international conventions on certain vessels employing deckhands.
 [10] Not credentialed
 [11] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.
 * Denotes variable

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**3. Variables.a. Mates.

At least two mates must be assigned on a seagoing inspected OSRV vessel when engaged in an operation over 12 hours in duration. One mate is required when engaged in an operation of less than 12 hours. The watches may be divided into at least two watches when engaged in an operation less than 12 hours in duration. The above scales presume that the master will also stand watches; if the overall responsibilities of the master preclude watchstanding, then an additional mate is required for vessels operating in excess of 12 hours.

b. Able Seamen (ABs). (2014)

At least 65 percent of the unlicensed deck crew on seagoing vessels over 100 GRT must hold endorsements for AB. Endorsement as AB-Special is the minimum AB qualification allowed by 46 U.S.C. 7312. The OCMI may consider allowing specially trained ordinary seaman (OS) meeting the requirements of NVIC 3-83 as substitutes for up to 35 percent of the required ABs on domestic voyages. Reference Section D.1. of Chapter B4 for additional information concerning the substitution of able seamen with specially trained ordinary seamen. On vessels engaged on voyages of less than 12 hours, 2 ABs may be permitted since the vessel may operate on a two watch schedule. However, the OCMI must consider the ability of the reduced crew to remain within the work hour limits of 46 U.S.C. 8104(n). The OCMI should assess the need for an additional number of ABs to be included in the required manning level. This may be required for vessels operating in an area routinely subject to inclement weather which requires additional lookouts to maintain an adequate watch, or on vessels requiring dedicated helmsmen to be assigned.

c. Engineers. (2014)

All OSRVs propelled by machinery of at least 300 GRT, regardless of route, require a credentialed engineer. Seagoing self-propelled inspected vessels of at least 200 GRT require a credentialed chief engineer, and other credentialed engineers as may be necessary to stand watches. Manning requirements for licensed engineers are found in 46 CFR 15.820 and 15.825. The scales represent a three-watch manning schedule for non-automated engineering propulsion plants. Depending on the level of sophistication of installed engineering automated control and monitoring systems, the credentialed engineering officers and ratings may be reduced based on the system's review and approval in accordance with 46 CFR Part 62 and other existing policy.

d. Tankermen. (2014, 2017)

Tankermen are required aboard these vessels whenever any transfer operations are conducted. At least two additional tankermen separate from the navigating crew are considered necessary for these operations to comply with the work hour limitations addressed in paragraph 1 of this Section. These additional tankermen might be provided as part of the incident response crew, or the owner may opt to have the additional qualified tankermen as part of the permanent crew. An individual holding

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

an endorsement as restricted tankerman under 46 CFR 13.111 may be utilized to satisfy the tankerman requirement, subject to any restrictions on the tankerman endorsement. Tankermen are not, necessarily, required during product recovery.

N. Oil Spill Response Barges (OSRBs).

1. Manning. (2014)

Title 46, United States Code, Chapter 87 allows the Secretary to prescribe the individuals serving on board an OSRV, (including an OSRB) who must hold a credential. Some OSRBs have been outfitted with skimming equipment having the capability to recover and store recovered oily liquids in bulk. This necessitates placing persons onboard the vessel for the safe operation of the barge and its machinery/equipment. Those persons who are assigned to the vessel, engage in the business of the vessel, and are part of the routine underway operations of the vessel are required to hold a valid credential. The number of persons required is determined by the cognizant Officer-in-Charge, Marine Inspection using the policy found in this section. When the vessel is in operation for training exercises and drills, and the evolution is less than 12 hours in duration the persons associated with the safe operation of the vessel may be reduced.

a. ABs and Ordinary Seaman. (2014)

At least 65 percent of the unlicensed deck crew on seagoing vessels over 100 GRT must hold endorsements for AB. The alternatives for ABs as found in the provision of Section B2.M.3.b. may be employed by the OCMI. The OCMI must consider the vessel's operation, work hour considerations and prevailing weather conditions when determining the proper number of deck crew.

b. Watchmen.

When the OSRB is outfitted with crew shelters/quarters and industrial workers have access to the vessel, a suitable number of watchmen shall be provided but will not be less than two.

c. Certificated Lifeboatmen

The number of certificated lifeboatmen must be separately stated on the COI. This number will vary depending on the lifeboat and life raft requirements for each vessel, in accordance with the regulations

d. Tankermen/Persons-In-Charge.

When required, these crewmembers shall be separate from the deck crew in order to comply with the work hour limitations. The vessel's COI should reflect this condition of operation.

2. Crew Quarters and Shelters.

The construction and structural fire protection standards for accommodations should meet the requirements found in 46 CFR, Subchapter D.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

3. Persons in Addition to the Crew (PACs). (2014, 2017)
To sustain operations during oil spill response, workers will be present aboard the OSRB to recover oil, but will necessarily be part of the underway operating crew assigned to the vessel. These workers are deemed industrial workers and are not required to hold an MMC as they are on board the vessel for the sole purpose of carrying out the industrial business or function of the vessel. These personnel will need to have access to the vessel as a work and training platform. For response operations, training purposes, and drills the total persons carried shall be determined by the OCMI and, as with permissive crewing, reflected in the vessel's Routes Permitted and Conditions of Operation section of the COI. These persons may not exceed the total capacity of primary lifesaving equipment on board the vessel, nor shall they adversely impact the vessel's stability. Unless the barge is specifically designed and constructed for the carriage of personnel, the following applies: On all voyages beyond the boundary line, all persons shall be transported on the attending vessel and transferred to the OSRB from the attending vessel upon arrival at the training/response site. All personnel transfers shall be conducted when the attending vessel master deems conditions safe for transfers. Adequate primary lifesaving equipment shall be on board the vessel for all persons carried. The OSRB will provide no overnight accommodations for the PACs, unless the provisions in paragraph B2.N.2. are met.
4. Attending Vessel.
When the OSRB is underway with persons onboard, engaged in oil spill operations, drills, or training exercises, a vessel must be in attendance at all times. The attending vessel must be capable of receiving all persons aboard in the event of an emergency evacuation, and shall be equipped as a standby vessel in accordance with 33 CFR 143.405. The attending vessel does not have to meet the multiple propellers or propulsion devices requirement of 33 CFR 143.405 provided the vessel can demonstrate it has adequate maneuvering capabilities.
5. Lightering and Discharges to Shoreside Reception Facility.
The OSRB is generally a tank barge that changed service to Oil Spill Recovery Barge. During an oil response, it is likely that these barges may be employed as lightering barges receiving recovered oil from other oil recovery vessels and then discharging their cargo to a shore facility. The person-in-charge of all oily liquid transfers shall have a tankerman endorsement for the grade(s) of cargo transferred that is appropriate for the vessel. A restricted tankerman endorsement in accordance with 46 CFR 13.111 is acceptable for these vessels. When engaged in lightering or oily liquid transfers, a minimum of two (2) persons-in-charge shall be on board the vessel. When lightering/transfer operations are less than 12 hours in duration only one person-in-charge is required. The persons-in-charge are only required during transfer operations and not for recovering oil. This requirement is an operational restriction and should be placed in the operating details of the COI. The following verbiage shall be used on the OSRB COI:

WHEN TRANSFERRING RECOVERED OILY LIQUIDS OR OIL TO OR FROM ANOTHER VESSEL OR FACILITY, A TANKERMAN-PERSON-IN-CHARGE SHALL BE PROVIDED."

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

O. Mobile Offshore Drilling Units (MODUs).

1. Sample Scales. (2014, 2017)

<u>Operating Mode</u>	<u>Master</u>	<u>Mate</u>	<u>Able Seamen</u>	<u>Ordinary Seamen</u>	<u>Radio Officers</u>	<u>Certificated Lifeboatmen</u>	<u>Chief Engineer</u>	<u>Assistant Engineer</u>	<u>QMED (Oilers)</u>

[8] Chief Mate with BS or BCO Endorsement [9] Mates with BCO Endorsement [10] Ballast Control Operator [11] Offshore Installation Manager [12] Barge Supervisor [13] See B4.D for Deck Department Ratings [14] See B4.E. for Engine Department Ratings [15] See 46 CFR 15.404(e) and (g) for Lifeboatmen. See also B2.B.2.f for general discussion. [16] One of the two BCOs may be eliminated when in operation on location. [17] ABs are required on seagoing non-self-propelled vessels in accordance with 46 U.S.C. 8702. ABs may be AB-special [46 U.S.C. 7312(c)(1)]. [18] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems. * Denotes variable</p>										

2. Variables. (2017)

- a. Offshore Installation Manager (OIM), Barge Supervisor (BS), And Ballast Control Operator (BCO).
Special MODU manning requirements may be found in 46 CFR 15.520 and 15.810.

- b. ABs And Ordinary Seamen. (2014)
On ocean or coastwise routes, the number of ABs and ordinary seamen carried must be sufficient for the watch system provisions of 46 U.S.C. 8104 and 46 CFR 15.840. In addition, the OCMI must ensure sufficient lifeboatmen will be provided through manning levels established (46 CFR 15.845).

- c. Engineers. (2014)
Individuals holding MODU engineer credentials may be substituted for the required credentialed engineers at the discretion of the OCMI.

3. Manning of Non-self Propelled Floating Outer Continental Shelf (OCS) Facilities. (2017)
See MSM Volume II Section G, Chapter 4.L.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART B: VESSEL MANNING

CHAPTER 2: SAMPLE VESSEL MANNING SCALES

NOTE: MODUs and other vessels operating solely with a dynamic positioning system are considered self-propelled motor vessels underway (even with a non-load bearing physical connection to the ocean bottom). Consequently, the STCW Convention watchkeeping and hours of rest provisions as well as the training and certification requirements apply beyond the Boundary Line established by 46 CFR Part 7. See also 79 FR 70944 [November 28, 2014] and MSM Volume II Section G. (2017)

P. Dredges. (2014, 2017)

Commercial dredges are subject to inspection and manning requirements either because they are propelled by steam or they are seagoing motor vessels. As such vessels are generally of 300 GRT or more, the standards in Section B2.E of this Volume should be used to establish manning scales for such vessels. Section B1.C also addresses specific factors to be considered in manning determinations. With regard to Section B2.X, dredges certificated for oceans routes, engaged in domestic service and not on a international voyage, may substitute an OICNW (Reg II/1) for the Chief Mate (Reg II/2) and an OICEW (Reg II/1) for the Second Engineer (U.S. 1st A/E) (Reg III/2).

Due to the diverse nature of dredging operations, COIs can be structured such that appropriate manning is specified for multiple voyage lengths and types under the Conditions of Operation. The following endorsement may be used when appropriate: "When engaged in dredging operations on lakes, bays, sounds, or rivers exclusively, or engaged on a coastwise voyage of less than 400 miles for the purpose of dumping dredge spoil, credentialed officers and certain crewmembers may be divided into at least two watches. The minimum manning shall be as follows:

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Water tender)	QMED (Oilers)	Tankermen
General Operations	1	1 ^[1]	2 ^[3]	1 ^[3]	-	-	-	1	1 ^[2, 5]	-	2 ^[4, 5]	-

- [1] See B3.D for Mate computations and COI formatting
- [2] See B3.F for Engineer computations and COI formatting
- [3] See B4.D for Deck Department Ratings
- [4] See B4.E for Engine Department Ratings
- [5] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.
- * Denotes variable

NOTE 1: Vessels operating exclusively on river routes are not required to carry credentialed personnel (see 46 U.S.C. 8701 and 8702). In such cases, it is appropriate to include the ratings by name on the COI followed by "NC" (Not Credentialed). (2014)

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

NOTE 2: For a distance of less than 400 miles, dredging operations can include those movements necessary to obtain fuel, stores, and for minor repairs. (2014)

Q. Nuclear-Powered Vessels. (2014)

Any request for a manning scale for a nuclear-powered vessel shall be forwarded to Commandant (CG-CVC).

R. Motor-Propelled Oceangoing Yachts.

1. Required Manning. (2014, 2017)

The statutory authority regarding the manning of seagoing motor-propelled yachts of 300 GRT or more is based on a combined reading of 46 U.S.C. 8101, 8301, and 8304. When certificating the vessel, consideration shall be given to manning, which includes the following:

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED. (Fireman/Water tender)	QMED.(Oilers)	Tankermen
General Operations	1 ^[5]	*1 ^[1,5]	*[3]	*[3]	-	-	-	*1	*1 ^[2, 6]	-	*[4, 6]	-
<p>[1] See B3.D for Mate computations and COI formatting [2] See B3.F for Engineer computations and COI formatting [3] See B4.D for Deck Department Ratings [4] See B4.E for Engine Department Ratings [5] See B3.I for Federal Pilotage [6] See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems. * Denotes variable</p>												

S. Hydrofoils And Air Cushion Vehicles (ACVs).

1. Under 100 GRT - Introduction. (2017)

The use of hydrofoils and ACVs in the U.S. has been limited to date. There are no regulations specifically addressing these vessels, and the Coast Guard's involvement has been only with those craft used as small passenger vessels. Until these vessels become more widely used, specific standards for operators cannot be established. The ultimate decision as to whether an applicant has adequate training and possesses sufficient knowledge and skill to operate a hydrofoil or ACV must rest with the OCMI. However, the following minimal requirements shall be applied:

a. Required Credential. (2014)

Possession of a credential endorsed as master for conventional passenger vessels of commensurate tonnage and, for vessels subject to the High-Speed Craft (HSC) Code, a type rating endorsement;

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

- b. Required Course. (2014)
Successful completion of a course conducted by either the manufacturer or owner of the vessel, acceptable to the OCMI or approved by the National Maritime Center (NMC) for a HSC type rating endorsement; and
- c. Operating Experience.
Completion of a period of operating experience, as required by the OCMI. For the first vessel of a particular type, the OCMI may make special arrangements for the initial operator to obtain operating experience.
- d. Training Courses. (2014, 2017)
The Coast Guard does not currently provide formal approval of training courses for hydrofoil and ACV operators, other than those that are considered High-Speed Craft under the HSC Code. Although hydrofoils and ACVs may not be built and classed to the High Speed Craft Code, the training required for personnel on a HSC is an appropriate reference. Training should be substantially similar to that prescribed in NVIC 20-14, which superseded NMC Policy Letter 6-01 (although the OCMI's discretion in this regard is not limited). The OCMI's prior review and acceptance of a training course's level of proficiency is appropriate; an inspector may be assigned to participate in or monitor such a course to evaluate its effectiveness.
- e. Manning Standards. (2014, 2017)
A hydrofoil or ACV shall carry two credentialed individuals having radar observer endorsements on their credentials; this arrangement will allow one operator to monitor the radar while the other "cons" the vessel. The number of required deckhands shall be determined by the OCMI according to the size and arrangement of the vessel, its route(s), and its operation; a minimum of four deckhands is envisioned.

NOTE: This manning scale applies only to vessels under 100 GRT, operating up to 12 consecutive hours. Vessels operating for more than 12 hours at a time shall be required to carry another full crew for relief purposes. (2014)

2. Hydrofoils And ACVs 100 GRT And More. (2014, 2017)
Requests relative to personnel qualifications and manning scales for large hydrofoils and ACVs, other than those subject to inspection under 46 U.S.C. 3301, shall be forwarded with full background information to the Commandant (CG-CVC), via the district commander. Insofar as practical, the manning scales for such vessels shall parallel those of conventional vessels of similar trades, routes, and tonnages. Requirements for special training, radar observer endorsements, and two credentialed individuals per deck watch shall apply; unique machinery installations may require special training or engineering personnel.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES****T. High-Speed Craft. (2014, 2017)**

The HSC Code requires that the Master and all officers having an operational role on high-speed craft be type rated. In accordance with 46 CFR 11.821, masters, mates and engineers seeking a HSC type-rating endorsement must hold a valid U. S. Coast Guard officer endorsement authorizing service in the appropriate grade, tonnage, horsepower, and route of the vessel(s) and present evidence of successful completion of Coast Guard approved training for which the type rating will be valid. Other members of the crew are required to receive training in accordance with section 18.3 of the HSC Code, but are not required to hold HSC type-rating endorsements (NVIC 20-14).

NOTE: High Speed Craft type-rating endorsements are NOT the same as an STCW endorsement in proficiency in fast rescue boats issued under 46 CFR 12.617. (2017)

1. International High-Speed Craft. (2017)

In accordance with Chapter 18 of the International code of Safety for high-Speed Craft (HSC Code), “the crew compliment shall be such that two officers are on duty in the operating compartment when the craft is underway, one of whom may be the master.”

2. Domestic High-Speed Vessels. (2017)

See NVIC 05-01, CH-1, Guidance for Enhancing the Operational Safety of Domestic High-Speed Vessels.

U. Submersible Vessels.**1. General. (2014)**

Currently, submersibles have only been inspected for service as passenger vessels. However, there are a number of uninspected vessels of this type, including uninspected passenger submersibles (carrying 6 or less passengers), oceanographic research and underwater survey submersibles. Eventually, there may be an expansion of services for this class of vessel which would necessitate inspection, such as its use as an industrial vessel. Coast Guard regulations do not currently address specific credentialing and manning requirements for submersibles. A manning and licensing proposal should be submitted to Commandant (CG-CVC) via the Officer-in-Charge, Marine Inspection (OCMI). This proposal should address the levels of personnel training and qualifications including certifications held, as well as the number of personnel considered necessary for the safe operation of the vessel. The credentialed officers as well as any crewmembers would be required to complete a comprehensive course prescribed by the vessel manufacturer. It is expected the course schedule should be similar to that noted in Section B2.S.2.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**2. Sample Scale. (2017)

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Water tender)	QMED (Others)	Tankermen
General Operations	1	*1	-	-	-	*[1,2]	-	-	-	-	-	-
[1] Additional deckhands based on number of passengers on board or service requirements. [2] Not credentialed < 100 GRT * Denotes variable												

3. Variables. (2014)

At least two credentialed officers should be provided to ensure the vessel can be safely operated under all conditions. This ensures that at least one other person is capable of taking control of the vessel's navigation should the pilot become incapacitated, and also provides another individual for assisting and directing the passengers and required crew in the event of an emergency.

V. Multi-Service/Route Manning. (2014)

The COI (or SMD/SML) for a multi-service and/or route vessel should be structured such that appropriate manning is specified for each vessel service and voyage length, including any operational limitations. For example, when appropriate a COI (or SMD/SML) may include manning scales for voyages of 600 miles and more as well as voyages of less than 600 miles. Where desired, the company should include in the manning proposal (see Chapter B1). This highest manning level is specified in the 'manning block' and all subordinate levels detailed under the 'routes permitted and conditions of operations' section of the COI.

1. Multi-Service (Certificated) Offshore Supply Vessels. (2014)

The OCMI is responsible for determining acceptable manning levels for vessels inspected in their respective OCMI zones. When a multi-service vessel is not operating as an OSV, it is required to meet the manning requirements of the applicable service. Any vessel operating as a multi-service vessel should have the type of service entered into the vessel's log book or record. Although an official logbook is not required for all OSVs, tank, or cargo and miscellaneous vessels operating in domestic service, 46 CFR Subchapter L requires that an OSV without an official logbook have an unofficial log or record (46 CFR 131.610). This entry should be made each time the vessel changes service. The master is to ensure that the service of the vessel (either OSV, tank, or cargo and miscellaneous) is officially noted in the vessel's logbook or record. This requirement should be entered into the conditions of operation on the vessel's COI. See also D8(m) Policy Letter 09-2001.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

W. Towing Vessels Inspected Under 46 CFR Subchapter M. (2017)

NOTE 1: Application of these manning scales for inspected towing vessels will follow the phase-in schedule of 46 CFR Subchapter M and should be used when issuing the initial COI. Upon the issuance of the initial COI any previous SMD/SML is considered superseded and should be removed from the vessel. (2017)

NOTE 2: Per 46 U.S.C. 8301(a), the minimum number of licensed individuals (i.e., credentialed officers) as specified in 46 U.S.C. 8301 does not apply to towing vessels certificated under 46 CFR Subchapter M as provided in 46 U.S.C. 89. Accordingly, the Coast Guard will generally not apply 46 CFR 15.810(b)(3) to towing vessels inspected under Subchapter M when permitted a two-watch system. The sample manning scales for the minimum number of mariners holding a license or MMC officer endorsement as mate in this section have been modeled on the prevailing watch system as well as the applicable hours of rest/work limitations as provided in 46 U.S.C. 8104. However, the OCMI has the authority to determine the specific manning levels for vessels required to have certificates of inspection by Part B of Subtitle II of Title 46 U.S.C., including the assignment of additional mates if determined necessary for the safe operation of the vessel.

46 U.S.C. 8301 and 46 CFR 15.810 apply in full to seagoing motor vessels, as defined in 46 U.S.C. 2101(33), regardless of whether they engage in towing. (2017)

See paragraph B2.G for Seagoing Motor Towing Vessels (> 300 GRT) and paragraph B2.D for Passenger-Carrying Barges Under Tow.

 [12] Not credentialed
 * Denotes variable

2. Common Variables. (2017)

a. Western Rivers Endorsement. (2017)

46 CFR 11.464(e) provides that in order to serve as master of towing vessels on the Western Rivers, a person must possess 90 days of observation and training and have an endorsement on his or her merchant mariner credential for Western Rivers.

b. Merchant Mariner Credential (MMC). (2017)

46 USC 8701 requires a merchant mariner credential for persons serving on vessels of 100 GRT and over. Per 46 USC 8701(a)(1), a MMC is **not** required of ratings serving on vessels operating only on rivers and lakes (except the Great Lakes).

c. Work Hour Limits. (2017)

(1) 46 USC 8104(h) provides that a person licensed to operate a towing vessel, to which 46 USC 8904 applies, may not work more than 12 hours in a consecutive 24-hour period, except in an emergency.

(2) In general, 46 U.S.C. 8104(c) stipulates that, on a towing vessel operating on the Great Lakes, a licensed or unlicensed seamen in the deck or engine department may not be required to work more than 8 hours in one day or permitted to work more than 15 hours in any 24-hour period, or more than 36 hours in any 72-hour period, except in an emergency when life or property are endangered. See Figure B7-1 NOTE 10 for additional discussion on the effects of a two or three watch system.

d. First-Class Pilotage. (2017)

(1) 46 CFR 15.535(c)(1) provides that a towing vessel moving a tank barge on the pilotage waters of the Lower Mississippi River must be under the control of an individual with a first-class pilot's license or endorsement, or an individual licensed to operate a towing vessel who has completed 12 round trips of the route

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

as an observer, with at least 3 of those trips during hours of darkness, and at least one round trip of the 12 within the last 5 years.

- (2) 46 CFR 15.535(c)(2) provides that a towing vessel operating light boat, or moving uninspected barges, on the pilotage waters of the Lower Mississippi River must be under the control of an individual with a first-class pilot's license or endorsement, or an individual licensed to operate a towing vessel who has completed at least 4 round trips over the route as an observer, with at least one of those trips during hours of darkness, and at least one round trip within the last 5 years.

e. Engineers. (2017)

- (1) A chief engineer is not required on a towing vessel inspected under 46 CFR Subchapter M operating exclusively on inland service (other than Great Lakes). However, 46 CFR 15.820(a)(3) requires inland (other than Great Lakes) vessels of 300 GRT and over to have an individual holding an MMC endorsed as chief engineer or other credential authorizing service as chief engineer, if the OCMI determines that an individual with such a license or endorsement responsible for the vessel's mechanical propulsion is necessary.

NOTE: For purposes of towing vessels, the applicable subchapter B definition of "inland waters" excludes the Western Rivers. See 46 CFR 10.107. Therefore, 46 CFR 15.820(a)(3) does not apply to a towing vessel when it is operating on Western Rivers, a term also defined in 46 CFR 10.107. Those towing vessels operating on inland waters beyond the Western Rivers may be required to have a credentialed individual responsible for the vessel's mechanical propulsion based on a vessel-specific assessment conducted by the cognizant OCMI. 81 FR 40008. (2017)

- (2) 46 CFR 15.820(a)(1) requires inspected seagoing or Great Lakes vessels of 200 GRT and over to have an individual holding an MMC or license endorsed as chief engineer or other credential authorizing service as chief engineer.
- (3) A chief engineer is not required on a towing vessel less than 200 GRT inspected under 46 CFR Subchapter M.
- (4) 46 CFR 15.915(a)(1) and (2) establish that on vessels of 500 GRT or less, a designated duty engineer (DDE) license or endorsement authorizes service as a chief or assistant engineer in the following manner:

A DDE limited to vessels of not more than 1,000 HP (750 kW) or 4,000 HP (3,000 kW) may serve only on near coastal, Great Lakes, or inland waters.

A DDE with no horsepower limitations may serve on any waters.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

- (5) Number of assistant engineers dependent on level of automation. See variable 3.b.
- f. Able Seamen. (2017)
- (1) 46 CFR 15.840(a) requires that on vessels of 100 GRT and over, except those operating only on rivers and lakes (except the Great Lakes), able seamen must comprise at least 65 percent of the deck crew. For vessels permitted to maintain a two-watch system, the percentage of able seamen may be reduced to 50 percent.
- (2) Vessels less than 100 GRT are not required to carry able seamen. See NVIC 1-95 for Voluntary Training Standards for Entry-Level Personnel on Towing Industry Vessels.
3. General Variables. (2017)
Other variables that may be applied to all vessels regardless of route and service. Variable 3.g. has been specifically included in the manning scales as a reference.
- a. Additional Manning. (2017)
Additional manning may be provided as specified in the Towing Safety Management System applicable to the vessel, taking into account the following factors:
- (1) Safety of personnel, equipment, and environment
 - (2) Service in which the towing vessel and tow are engaged
 - (3) Number, size, and type of barges to be towed
 - (4) Route/geographic area of operation
 - (5) Functional duties required of crew in addition to standard navigation
 - (6) Configuration of vessel superstructure, deck, and engine room
 - (7) Extent of automation
 - (8) Size and power of equipment used
 - (9) Prevailing environmental and climatic conditions
 - (10) Experience of crew
 - (11) Availability of assistance
- These additional crewmembers should be annotated on the COI as “Additional Persons in Crew” and be accounted for in the total allowed on board for the correct amount of lifesaving equipment to be carried.
- b. Machinery Space Attendance And Reduced Manning. (2017)
Where there is a requirement for engine room manning, 46 CFR 15.715(a) allows the Coast Guard to accept automated systems to replace specific personnel or reduce overall crew requirements as appropriate given the capabilities of the automated system, the system’s demonstrated and continuing reliability, and a planned maintenance program that ensures the continued safe operation of the vessel. There is no requirement for engine room manning for vessels of less than 100 GRT as well as for those that only operate on Rivers, and Lakes (except the Great Lakes) Bays and Sounds.

PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

As specified in the table below, 46 CFR Part 130 Subpart D or an acceptable equivalent will be favorably considered by the Coast Guard as meeting the criteria for the elimination of continuous watchstanding in the engine-room. The table provides the applicability and references related to machinery space attendance and reduced manning for towing vessels inspected under Subchapter M. Acceptable equivalents include 46 CFR Part 62 or NVIC 1-78 (series) as well as an appropriate, valid, notation for unattended machinery space from a Recognized Classification Society for classed vessels.

The minimum required engine department manning level necessary to provide for the safe operation of the propulsion machinery in the unattended mode is the responsibility of the cognizant OCMI, taking into consideration the various other concerns that bear on manning level determinations. Prior to any reductions in engineering personnel, the OCMI must be satisfied with the arrangements to ensure adequate watchkeeping, hours of rest, and provisions for onboard maintenance. All provisions for reductions in the engineering complement based on automation should be adequately specified in the manning proposal (see Chapter B1). The established manning level must not be less than the minimums stipulated by law or regulation. See Chapter B6.A.3.b.(4)(d) & (e) for guidance on the issuance of the COI and B6.A.4. for annual inspections.

Particulars	Unattended Machinery Space (PUMS)	Reduced Manning (w/PUMS)	a) Plan Review & Procedure approval b) Trial Period
Seagoing 100 GRT to 299 GRT ^[1,2,4]	46 CFR Part 130 Subpart D	46 CFR 62.50-20(h) & 62.50-30(j)	a) 46 CFR 130.480 submitted to comply with 46 CFR 144.135 & 144.145 b) No
Seagoing 300 GRT to 499 GRT ^[1,2]	46 CFR Part 130 Subpart D & 46 CFR Part 61	46 CFR 62.50-20(h) & 62.50-30(j)	See B6.A.3 ^[3]
Exclusive Great Lakes >100 GRT ^[1,4]	46 CFR Part 130 Subpart D	46 CFR 62.50-20(h) & 62.50-30(j)	a) 46 CFR 130.480 submitted to comply with 46 CFR 144.135 & 144.145 b) No

¹GT ITC is used for vessels measured solely under the Convention Measurement System.

²SOLAS Chapter II-1, including Part E, may apply for vessels of 500 GT ITC or more on an international voyage depending on keel laying date.

³Vessels certificated in accordance with 46 CFR Subchapter I should follow Chapter B6.A.3., with the exception that 46 CFR Part 130 Subpart D may be accepted in lieu of 46 CFR Part 62 as specified in this section.

⁴Chief Engineer is required for vessels of 200 GRT and over (46 CFR 15.820(a)(1)).

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**c. Persons in Charge (PIC) of Fuel Transfers. (2017)

33 CFR 155.710(e)(1) prescribes requirements for persons in charge (PIC) of fuel transfers requiring a Declaration of Inspection. A PIC of a fuel transfer on a towing vessel inspected under 46 CFR Subchapter M must either: 1) hold a valid merchant mariner credential authorizing service as a master, mate, pilot, engineer, or operator aboard that vessel; or 2) hold a valid merchant mariner credential with the appropriate endorsement, such as Tankerman-PIC. Per 33 CFR 156.100, this applies to the transfer of oil or hazardous material on the navigable waters or contiguous zone of the United States to, from, or within each vessel with a capacity of 250 barrels or more (10,500 gallons). Specifically, 33 CFR 156.120(s) includes a transfer between two vessels, when at least one of the vessels has a capacity of 250 barrels or more (62 FR 25116). See 81 FR 40083 for implementation. Mariners on U. S. vessels involved with the bunkering operation should be trained in accordance with 46 CFR 15.405 (Familiarity with vessel characteristics) before assuming their duties and responsibilities.

NOTE: See CG-MMC Policy Letter 01-17 for Guidelines for Issuing Endorsements for Tankerman-PIC Restricted to Fuel Transfers on Towing Vessels. Endorsements issued under this policy are only valid for towing vessels certificated under 46 CFR Subchapter M engaged in domestic service and does not include any transfer of liquid/gas cargo in bulk or cargo-tank cleaning. A medical certificate is not required for service under this endorsement. The requirements of 46 CFR Part 10 must be met prior to serving in any other capacity requiring a MMC, including; Wiper, OS, or SD(FH). (2017)

d. Master or Mate (Pilot) with Appropriate Geographic Endorsement. (2017)

46 CFR 15.535(b) provides that a towing vessel over 26 feet in length must be under the direction and control of a person licensed as master or mate (pilot) of towing vessels or as master or mate of steam or motor vessels greater than 200 GRT holding either an endorsement on his or her license for towing vessels or a completed Towing Officer's Assessment Record (TOAR) signed by a designated examiner indicating that the officer is proficient in the operation of towing vessels. See also Figure B3-2: Towing Endorsement Table. For routes other than the Western Rivers, 46 CFR 11.464(f) & (g) provide a 30 day observation and training requirement for mariners in control of towing vessels.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**e. Work Hour Limits. (2017)

In general, 46 USC 8104(h) provides that a person licensed to operate a towing vessel may work no more than 12 hours in a consecutive 24-hour period, except in an emergency. 46 USC 8104 (c) states that on a towing vessel (except a towing vessel operated only for fishing, fish processing, fish tender, or engaged in salvage operations) operating on the Great Lakes, harbors of the Great Lakes, and connecting or tributary waters between Gary, Indiana, Duluth, Minnesota, Niagara Falls, New York, and Ogdensburg, New York, a licensed individual or seaman in the deck or engine department may not be required to work more than 8 hours in one day or permitted to work more than 15 hours in any 24-hour period, or more than 36 hours in any 72-hour period, except in an emergency when life or property are endangered.

f. First-Class Pilotage and “Acting As” Pilots. (2017)

See 46 CFR 15.610 & 15.812 as well as 46 USC 8502 for pilotage regulations. For "acting as" pilots specifically 46 CFR 15.812(b)(2), which applies to coastwise seagoing and Great Lakes towing vessels of not more than 1,600 GRT. See Part A, Chapter 11 and Part B, Chapter 3 for detailed discussion of pilotage requirements.

g. International Convention on Standards of Training, Certification, and Watchkeeping (STCW). (2017)

STCW is applicable to towing vessels operating beyond the boundary line specified in 46 CFR Part 7, except as noted in 46 CFR 15.1101(a)(1) and (2). Specifically, vessels operating exclusively on the Great Lakes or on the inland waters of the U.S., in the Straits of Juan de Fuca, or on the Inside Passage between Puget Sound and Cape Spencer are exempt from application of STCW. Additionally, vessels of less than 200 GRT (other than passenger vessels subject to subchapter H of 46 CFR chapter I) engaged exclusively on domestic voyages are not subject to any obligation for the purposes of STCW. See Chapters B3, B4, and B5. See also Figures B2-3 and B2-4.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES****X. Manning And STCW Certification Reference Tables (Seagoing Vessels). (2014, 2017)**

The tables found in this Section provide guidance on the numbers of credentialed deck and engineer officers appropriate to different sizes of vessels (tonnage), trading areas, and aggregate propulsion power as well as STCW certification references. The STCW references indicate the endorsements required, not the minimum manning level. Additional tables are provided, pertaining to towing vessels (uninspected (UTVs) or Subchapter M) and offshore supply vessels (OSVs). These tables do not address or provide guidance applicable to Mobile Offshore Drilling Units (MODUs). The number of ratings required should be determined by the factors summarized elsewhere in this Chapter. As the watchkeeping arrangements for the engineering department and the demands placed on personnel vary significantly according to the level of automation, these tables only provide guidance and are not all-inclusive. It must be clearly understood that these tables are stated for conventional (NON-AUTOMATED) vessels, and do not invalidate the basic legal requirements outlined in Chapter B1 of this Volume. OCMI's as well as owners/operators must take all relevant factors into account during the manning determination process. In consideration of the manning scale variables, the OCMI should give due regard to the company's manning proposal as discussed in Chapter B1. See Chapter B3, paragraph B.2 for discussion on STCW applicability.

The Manning and STCW Certification Reference Tables provide the format necessary to present the comprehensive relationship between U.S. manning regulations (GRT) and STCW Certification requirements (GT ITC). With limited exceptions, the Size of Vessel column, for determining the number of credentialed officers in the required complement, is based on GRT, including for dual-tonnage vessels, (See Chapter B3, paragraph B.1). For vessels measured solely under the Convention Measurement System, the GT ITC is used to apply manning requirements. For U.S. vessels of less than 1600 GRT operating exclusively to and from U.S. ports, the STCW Grade of Officer columns are based on GRT (See Chapter B3, paragraph B.3), otherwise the GT ITC is used if assigned.

NOTE: In addition to meeting the required provisions of STCW, mariners must also hold the corresponding domestic endorsement appropriate for the vessel and trading area (46 CFR 15.401). Reference 46 CFR 15.105(g) for certain vessels engaged on domestic, near-coastal voyages (See Chapter B3, paragraph B.2.d.). (2014)

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

Figure B2-1: Deck Officer Table (2014, 2017)

Trading Area	Inspection Status	Size of Vessel (GRT)	Number; Grade of Officers to be carried – STCW			
			Reg II/2 Master	Reg II/2 Ch.Mate	Reg II/1 OICNW	Reg II/3 OICNW
Unlimited	Inspected	≥1,000	1	1(e)(f)	2(a)(f)	-
Unlimited	Inspected	<1,000 ≥500	1	-	2(f)	-
Unlimited	Inspected	<500 ≥100	1	-	2(f)	-
Unlimited	Inspected	<100	1	-	1(c)	-
Unlimited	Uninspected	<300 ≥200	1	-	2(d)	-
Unlimited	Uninspected	<200	1	-	1(c)	-

Near-Coastal	Inspected	<1,000 ≥500	1	-	2(f)	-
Near-Coastal	Inspected	<500 ≥100	-	-	-	3(b),(f)(g)
Near-Coastal	Inspected	<100	-	-	-	2(b)(c)
Near-Coastal	Uninspected	<300 ≥200	-	-	-	3(b)(d)(g)
Near-Coastal	Uninspected	<200	-	-	-	-(c)

Variables

- a. When on a voyage of less than 400 miles from port of departure to port of final destination, OICNW (mate) may be reduced to one.
- b. One must have an endorsement for the capacity of master.
- c. Vessels on voyages not exceeding 12 hours in duration may, if the OCMI determines it to be safe, be operated without mates. For uninspected vessels, see Chapter B7.
- d. An individual in charge of the navigation or maneuvering of a self-propelled, uninspected, documented, seagoing vessel of 200 GRT or over must hold an appropriate license or MMC authorizing service as mate.
- e. On vessels of less than 1600 GRT an OICNW (Reg II/1) may be substituted for the Chief Mate (Reg II/2).
- f. Inspected seagoing motor towing vessels (> 300 GRT) may utilize a two-watch system on voyages of less than 600 miles. However, the minimum number of mates required by 46 U.S.C. 8301 and 46 CFR 15.810 applies regardless. See Section B2.G.
- g. Depending on voyage/vessel particulars, vessels of 500 GT ITC or more may require a Master (Reg II/2) and Mates (Reg II/1). See Figure B3-1 for tonnage applicability.

CHAPTER 2: SAMPLE VESSEL MANNING SCALES

Figure B2-2: Engineer Officer Table (Con't)

Trading Area	Inspection Status Size of Vessel (GRT)	Registered Propulsion Power kW (hp)	Number; Grade of Officers to be carried – STCW			Total
			Chief Engineer	Second Engineer (U.S. 1 st A/E)	OICEW (j)	
Unlimited	Uninspected <300 ≥200	<3,000kW (4,000hp) ≥750kW (1,000hp)	1; III/3(b)(d)	-	2; III/1(c)(e)	3
Unlimited	Uninspected <200	≥3,000kW (4,000hp)	(h); III/2(b)	-	(h); III/1(c)	See CH. B3 Para. E
Unlimited	Uninspected <200	<3,000kW (4,000hp) ≥750kW (1,000hp)	(h); III/3(b)	-	(h); III/1(c)	See CH. B3 Para. E
Near-Coastal	Inspected ≥1000	≥3,000kW (4,000hp)	1; III/2	1(i); III/2	2; III/1	4
Near-Coastal	Inspected <1000 ≥500	≥3,000kW (4,000hp)	1; III/2	1(i); III/2	2(a); III/1	4
Near-Coastal	Inspected <500 ≥100	≥3,000kW (4,000hp)	1; III/2(b)	1; III/2(b)	2(a); III/1(c)	4
Near-Coastal	Inspected <100	≥3,000kW (4,000hp)	(h)	-	(h)	-
Near-Coastal	Inspected ≥1000	<3,000kW (4,000hp) ≥750kW (1,000hp)	1; III/3	1(i); III/3	2; III/1	4
Near-Coastal	Inspected <1000 ≥500	<3,000kW (4,000hp) ≥750kW (1,000hp)	1; III/3	1(i); III/3	2(a); III/1	4
Near-Coastal	Inspected <500 ≥100	<3,000kW (4,000hp) ≥750kW (1,000hp)	1; III/3(f)	1; III/3(f)	2(a); III/1(g)	4

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

Figure B2-2: Engineer Officer Table (Con't)

Trading Area	Inspection Status Size of Vessel (GRT)	Registered Propulsion Power kW (hp)	Number; Grade of Officers to be carried – STCW			Total
			Chief Engineer	Second Engineer (U.S. 1 st A/E)	OICEW (j)	
Near-Coastal	Inspected <100	<3,000kW (4,000hp) ≥750kW (1,000hp)	(h)	-	(h)	-
Near-Coastal	Uninspected <300 ≥200	≥3,000kW (4,000hp)	1; III/2(b)(d)	-	2; III/1(e)(g)	3
Near-Coastal	Uninspected <300 ≥200	<3,000kW (4,000hp) ≥750kW (1,000hp)	1; III/3(b)(f)	-	2; III/1(e)	3
Near-Coastal	Uninspected <200	≥3,000kW (4,000hp)	(h); III/2(b)	-	(h); III/1(c)	See CH. B3 Para. E
Near-Coastal	Uninspected <200	<3,000kW (4,000hp) ≥750kW (1,000hp)	(h); III/3(f)	-	(h); III/1(g)	See CH. B3 Para. E

Variables

- a. If the OCMI determines it to be safe and a three watch system can effectively be maintained, OICEW may be reduced to one.
- b. A designated duty engineer with no horse power limitation, endorsed in accordance with STCW III/2 or III/3 (propulsion power dependant), is authorized for service as chief engineer or second engineer (U.S. 1st A/E) on vessels of not more than 500 GRT on any waters.
- c. A designated duty engineer with no horse power limitation, endorsed in accordance with STCW III/1, is authorized for service as OICEW on vessels of not more than 500 GRT on any waters.
- d. An individual engaged or employed to perform the duties of chief engineer on a mechanically propelled, uninspected, seagoing, documented vessel of 200 GRT or over must hold an appropriately endorsed license or MMC authorizing service as a chief engineer.
- e. An individual in charge of an engineering watch on a mechanically propelled seagoing, documented vessel of 200 GRT or over must hold an appropriately endorsed license of MMC authorizing service as an assistant engineer.

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

- f. A designated duty engineer limited to vessels of not more than 3000kW (4,000hp), endorsed in accordance with STCW III/3, is authorized for service as chief engineer or second engineer (U.S. 1st A/E) on vessels of not more than 500 GRT on near-coastal waters.
- g. A designated duty engineer limited to vessels of not more than 3000kW (4,000hp), endorsed in accordance with STCW III/1, is authorized for service as OICEW on vessels of not more than 500 GRT on near-coastal waters.
- h. 46 CFR 15.1103(a) may apply.
- i. On vessels of less than 1600 GRT an OICEW (Reg III/1) may be substituted for the Second Engineer (U.S. 1st A/E) (Reg III/2).
- j. See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

Near-Coastal	2 (<600)	<200	-	-	-	2(a)(c)(d)

Variables

- a. 46 CFR 15.535(b) or 15.610(a) apply.
- b. An individual in charge of the navigation or maneuvering of a self-propelled, uninspected, documented, seagoing vessel of 200 GRT or over must hold an appropriate license or MMC authorizing service as mate.
- c. One must have an endorsement for the capacity of master.
- d. 46 CFR 15.1103(a) applies.
- e. 46 CFR 15.705(d) applies. An additional Mate (Reg II/1 OICNW) should be considered to avoid potential conflicts with STCW hours of rest provisions. See Chapter B5, Section A.5.b. for additional information.
- f. Depending on voyage/vessel particulars, vessels of 500 GT ITC or more may require a Master (Reg II/2) and Mates (Reg II/1). See Figure B3-1 for tonnage applicability.

Variables

- A designated duty engineer with no horse power limitation, endorsed in accordance with STCW III/2 or III/3 (propulsion power dependant), is authorized for service as chief engineer or second engineer (U.S. 1st A/E) on vessels of not more than 500 GRT on any waters.
- A designated duty engineer with no horse power limitation, endorsed in accordance with STCW III/1, is authorized for service as OICEW on vessels of not more than 500 GRT on any waters.
- An individual engaged or employed to perform the duties of chief engineer on a mechanically propelled, uninspected, seagoing, documented vessel of 200 GRT or over must hold an appropriately endorsed license or MMC authorizing service as a chief engineer (see 46 CFR 15.820(b)).

PART B: VESSEL MANNING**CHAPTER 2: SAMPLE VESSEL MANNING SCALES**

- d. An individual in charge of an engineering watch on a mechanically propelled seagoing, documented vessel of 200 GRT or over must hold an appropriately endorsed license or MMC authorizing service as an assistant engineer (see 46 CFR 15.825(a)).
- e. A designated duty engineer limited to vessels of not more than 3,000kW (4,000hp), endorsed in accordance with STCW III/3, is authorized for service as chief engineer or second engineer (U.S. 1st A/E) on vessels of not more than 500 GRT on near-coastal waters.
- f. A designated duty engineer limited to vessels of not more than 3,000kW (4,000hp), endorsed in accordance with STCW III/1, is authorized for service as OICEW on vessels of not more than 500 GRT on near-coastal waters.
- g. 46 CFR 15.1103(a) may apply.
- h. See B6.A.3.b(4)(d)&(e) for Issuance of COI with reduced manning based on automated engineering systems.

PART B: VESSEL MANNING
CHAPTER 2: SAMPLE VESSEL MANNING SCALES

Figure B2-5: Offshore Supply Vessels (OSV) – Deck Officers (2014)

Trading Area	Watch System	Size of Vessel (GRT/ GT ITC)	Number; Grade of Officers to be carried – STCW			
			Reg II/2 Master	Reg II/2 Ch.Mate	Reg II/1 OICNW	Reg II/3 OICNW
Unlimited	3 (≥600 miles)	≥6,000 GT ITC	1; II/2	1; II/2	2; II/1	-
Unlimited	3 (≥600 miles)	<500 GRT or 6,000 GT ITC	1; II/2	-	2(c); II/1	-
Unlimited	2 (≤600 miles)	≥6,000 GT ITC	1; II/2	1; II/2	1; II/1	-
Unlimited	2 (≤600 miles)	<500 GRT or 6,000 GT ITC	1; II/2	-	1(c); II/1	-
Near-Coastal	3 (≥600 miles)	≥6,000 GT ITC	1; II/2	1; II/2	2; II/1	-
Near-Coastal	3 (≥600 miles)	<500 GRT(a) or 6,000 GT ITC ≥500 GT ITC	1; II/2	-	2(c); II/1	-
Near-Coastal	2 (≤600 miles)	≥6,000 GT ITC	1; II/2	1; II/2	1; II/1	-
Near-Coastal	2 (≤600 miles)	<500 GRT(a) or 6,000 GT ITC ≥500 GT ITC	1; II/2	-	1(c); II/1	-
Near-Coastal	3 (≥600 miles)	<500 GT ITC	-	-	-	3(c); II/3(b)
Near-Coastal	2 (≤600 miles)	<500 GT ITC	-	-	-	2(c); II/3(b)

Variables

- a. If a vessel is only assigned a GRT and no GT ITC, then the master and mate may be certificated in accordance with STCW II/3 for a vessel of less than 500 GRT on a near coastal voyage.
- b. One must have an endorsement as master.
- c. For OSVs less than 100 GRT, see 46 CFR 15.810 (b)(5).

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS****LIST OF FIGURES**

Figure B3-1: Tonnage Applicability: Dual-Tonnage Vessels	B3-9
Figure B3-2: Towing Endorsement Table	B3-18

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS****A. Introduction. (2014)**

Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. Refer to paragraph B1.A for a summary of all Chapters. This Chapter provides supplementary guidance on the manning requirements for credentialed officers, as well as a detailed discussion on the impact of international standards.

B. Impact Of International Standards. (2014)

The combined effect of several international conventions significantly impact manning standards for credentialed personnel on U.S. documented vessels operating beyond the boundary line. A conceptual understanding of the relationship between the fundamentals of the manning level provisions relating to the establishment of crew complement and the certification requirements for the requisite crew is essential to the administration of the safe manning principles. The manning levels on U.S. documented vessels are derived from statutory and regulatory requirements, in concert with official directives.

1. Officer's Competency Certificates Convention (OCCC) 1936. (2014, 2017)

The OCCC is implemented in 46 U.S.C. 8304 requiring persons serving in the capacity of master, mate, or engineer on any vessel operating on the high seas (i.e., operating beyond the boundary line) of 200 GRT or over to hold a certificate of competency issued under 46 U.S.C. 7101 appropriate for the route and tonnage of the vessel. The OCCC differs from other conventions in that various definitions are presented, which associate positions such as navigating officer and engineer officer in charge of a watch with any person that is actually in charge of the navigation or maneuvering of a vessel or running of a vessel's engines, respectively. In essence, this means that any person performing duties as defined under the Convention must be the holder of an appropriate officer endorsement, and not merely a merchant mariner's document/credential or rating endorsement. This doctrine serves as the statutory framework for the prescription of a distinct tonnage threshold to be applied as the basis for determining the minimum number of credentialed officers required for the safe operation of a vessel. The OCCC differs from other international instruments in relation to the applicability of the U.S. Regulatory Measurement System versus the measurement system of the International Convention on Tonnage Measurement of Ships, 1969, otherwise known as the Convention Measurement System. Accordingly, for vessels that have requested and received a GRT measurement, the Secretary is required to use the Regulatory Measurement System tonnage as the basis for determining the required number of credentialed officers in a crew complement (46 U.S.C. 14305). For vessels measured solely under the Convention Measurement System, the GT ITC is used to apply manning requirements. Mariners engaged to perform the duties in this capacity, as required by statute or regulation, are obliged to comply with the training and certification requirements of STCW, as applicable (see paragraphs B.2 and B.3 of this Chapter).

NOTE: See NVIC 02-13 for guidance on implementing the Maritime Labour Convention, 2006. (2017)

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**2. International Convention Of Standards Of Training, Certification And Watchkeeping For Seafarers (STCW) 1978, as amended. (2014)

The U.S. regulations (46 CFR Parts 10, 11, 12, 13, and 15) parallel the provisions in STCW regarding the qualification and training requirements for watchstanding personnel. Through various amendments, STCW prescribes minimum standards relating to training, certification and watchkeeping for seafarers, which Parties are obliged to meet or exceed. Although STCW does not include specific manning level requirements, it does impact manning decisions where certification and training are concerned. Except as noted in 46 CFR 15.1101(a)(1) and (2), the STCW regulations apply to seagoing vessels as defined in 46 CFR 10.107. As discussed in 46 CFR 15.1103, onboard a seagoing vessel operating beyond the boundary line, as described in 46 CFR Part 7, no person may employ or engage any person to serve, and no person may serve, in a position requiring a person to hold an STCW endorsement, including master, chief mate, chief engineer officer, second engineer officer, officer of the navigational or engineering watch, or GMDSS radio operator, unless the person serving holds an appropriate, valid STCW endorsement issued in accordance with 46 CFR Part 11. Mariners engaged to perform certain shipboard duties, as required by statute or regulation, are obliged to comply with the training and certification requirements of STCW, as applicable (see paragraph B.3 of this Chapter).

NOTE: 2010 STCW Amendments, Transitional Provisions.

The 2010 STCW Amendments came into force on 1 January 2012, including the new requirements for minimum rest hours and record of hours of work. In many cases, there is a five-year transitional period, until 1 January 2017*, to allow for a phased in implementation of the provisions. However, in some cases (e.g. security endorsements) implementation is sooner. Attention must be paid to these entry into force dates to ensure appropriate compliance. Nevertheless, after 1 January 2017*, all mariners serving on vessels subject to STCW must meet the STCW Convention standards, including the 2010 Amendments. The International Maritime Organization (IMO) issued Circulars STCW.7/Circ.16, STCW.7/Circ.17, and STCW.7/Circ.21 which provide clarification of the transitional provisions and advice (for Port State Control Officers) on the transitional arrangements leading up to full implementation of the 2010 Amendments to the STCW Convention and Code on 1 January, 2017*. (2014)

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**a. Deck Department Structure. (2014)

STCW identifies three licensed deck officer positions: master, chief mate and officer in charge of a navigational watch (e.g., mate). Refer to Chapter B2 for Manning and STCW Certification Reference Tables.

STCW Regulation	STCW Capacity	Factors
II/1	Officer in Charge of a Navigational Watch (OICNW)	Seagoing vessels of 500 GT ITC or more.
II/2	Master and Chief Mate	Seagoing vessels of 500 GT ITC or more.
II/3	Master and OICNW *See II/3.1 & .2 for vessels not engaged on near-coastal voyages	Seagoing vessels of less than 500 GT ITC engaged on near-coastal voyages.

b. Engine Department Structure. (2014, 2017)

STCW identifies three licensed engineer officer positions: chief engineer, second engineer officer (equivalent to a U.S. credentialed first assistant engineer), and officer in charge of an engineering watch (equivalent to a U.S. credentialed second or third assistant engineer or designated duty engineer). Refer to Chapter B2 for Manning and STCW Certification Reference Tables.

STCW Regulation	STCW Capacity	Factors
III/1	Officer in Charge of an Engineering Watch (OICEW)	Seagoing vessels powered by main propulsion machinery of 750 kW (1,000 hp) propulsion power or more.
III/2	Chief Engineer and Second (First Assistant) Engineer Officer	Seagoing vessels powered by main propulsion machinery of 3,000 kW (4,000 hp) propulsion power or more.
III/3	Chief Engineer and Second (First Assistant) Engineer Officer	Seagoing vessels powered by main propulsion machinery of between 750 kW (1,000 hp) and 3,000 kW (4,000 hp) propulsion power.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

(1) Designated Duty Engineer (DDE). Under U.S. provisions, if appropriately endorsed in accordance with the applicable STCW requirements, a DDE license or endorsement authorizes service as chief (III/2 or III/3) or assistant engineer (III/1) on vessels of not more than 500 GRT (GT ITC if GRT is not assigned) in the following manner:

(a) A DDE limited to vessels of not more than 1000 hp or 4000 hp may serve only on near coastal, Great lakes, or inland waters;

(b) A DDE with no horsepower limitations may serve on any waters.

NOTE: The term designated duty engineer (DDE) employed under U.S. regulations is not synonymous with the similarly used term in STCW. The term DDE in U.S. regulations specifically refers to a national engineer officer endorsement (46 CFR 11.524) and authorizes service as a chief or assistant engineer on vessels of less than 500 GRT within certain restrictions (46 CFR 15.915). Whereas, DDE in STCW pertains to an engineering duty status in a periodically unmanned engine-room under Regulation III/1. However, as provided in 46 CFR 11.524, an engineer officer nationally endorsed as DDE may qualify for an STCW endorsement (III/1, III/2, and/or III/3). (2014)

(2) Electro-Technical Officer (ETO). Although the Coast Guard has amended the regulations to facilitate the issuance of ETO endorsements in accordance with STCW Regulations III/6, there is no corresponding regulation to require an ETO under the provisions of safe manning. However, should the COI or SMD stipulate a specific carriage requirement or if an ETO is voluntarily carried, the persons serving in that capacity should be duly endorsed. See MSIB 006-17.

c. Additional Requirements. (2014, 2017)

(1) Basic Training (46 CFR 15.1105). Onboard a seagoing vessel to which this section applies, no person may assign a shipboard duty or responsibility to any person who is serving in a position that must be filled as part of the required crew complement or who is assigned a responsibility on the muster list, and no person may perform any such duty or responsibility, unless the person performing it can produce evidence of having:

(a) Received appropriate approved basic training or instruction as set out in the standards of competence under STCW Regulation VI/1, with respect to personal survival techniques, fire prevention and fire-fighting, elementary first aid, and personal safety and social responsibilities; and

(b) Maintained the standard of competence under STCW Regulation VI/1, with respect to personal survival techniques, fire prevention and fire-fighting, elementary first aid, and personal safety and social responsibilities, every 5 years.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

- (2) Lifeboatman (46 CFR 15.404(e) and (g)). Every person assigned duties as a lifeboatman must hold a credential attesting to such proficiency. Persons serving on vessels subject to the STCW Convention must also hold an appropriate STCW endorsement (VI/2) in proficiency in survival craft and rescue boats other than fast rescue boats (PSC), or in proficiency in fast rescue boats.
- (3) Tankerman. See 46 CFR 15.860.
- (4) Passenger Vessels On International Voyages. In accordance with 46 CFR 15.1103(f), onboard a passenger ship, as defined by the Convention for the Safety of Life at Sea, 1974, as amended (SOLAS), on an international voyage, any person serving as master, chief mate, mate, chief engineer, engineer officer, and any person holding a license, MMD, or MMC and performing duties relating to safety, cargo handling, or care for passengers, must meet the appropriate requirements of Regulation V/2 of the STCW Convention. These individuals must hold documentary evidence to show they meet these requirements. 46 CFR 11.1105 and 12.905 set out similar requirements.
- (5) Medical Certificates. After 1 January 2017, all persons employed or engaged onboard vessels to which STCW applies must hold a medical certificate valid for 2 years unless the mariner is under the age of 18, in which case the maximum period of validity is 1 year (46 CFR 15.401(c)/15.1103(h)). If a mariner's medical certificate expires during a voyage, it will remain valid until the next United States port of call, provided that the period after expiration does not exceed 90 days (46 CFR 15.1103(h)(3)). See page ANNEX-11 for additional information and transitional provisions.

NOTE: For ships subject to the Polar Code, reference CG-OES Policy Letter 01-16: Guidelines for Training of Personnel on Ships Subject to the International Code for Ships Operating in Polar Waters (Polar Code). (2017)

- d. Near-Coastal Voyages. (2014, 2017)
 - (1) Domestic Near-Coastal Voyages. The application of STCW to vessels on domestic voyages is not a result of the 1995 Amendments. STCW, as adopted in 1978 and as ratified by the United States in 1991, applied to personnel serving on "seagoing vessels," not only vessels on international voyages. Consequently, the Coast Guard is not able to provide a general exemption for seagoing vessels on domestic-only voyages. However, as provided in 46 CFR 15.105(g), personnel serving on the following small vessels engaged exclusively on domestic, near-coastal voyages are in compliance with 46 CFR Subpart K and are, therefore, not subject to further requirements for the purposes of the STCW Convention (also see paragraph B3.B.3.b):
 - (a) Small passenger vessels subject to Subchapter T or K of title 46, CFR.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

- (b) Vessels of less than 200 GRT (other than passenger vessels subject to Subchapter H of title 46 CFR).
- (c) Uninspected passenger vessels (UPVs) as defined in 46 U.S.C. 2101(42)(B). Under 46 CFR 15.105(h), personnel serving on vessels identified in paragraphs B3.B.2.d.1.a and b may be issued, without additional proof of qualification, an appropriate STCW endorsement on their credential when the Coast Guard determines that such an endorsement is necessary to enable the vessel to engage on a single international voyage of a non-routine nature. The STCW endorsement will be expressly limited to service on the vessel or the class of vessels and will not establish qualification for any other purpose.

NOTE: A Panama Canal transit constitutes an international voyage (see Historical and Statutory Notes, 46 U.S.C.A. 114 [West 2007]). (2017)

- (2) Foreign Near-Coastal Voyages. Foreign Administrations which are signatory to the STCW Convention may accept, by means of a bi-lateral agreement with the United States, the near-coastal STCW endorsements issued to U.S. mariners for service on vessels regularly engaged on voyages in the near-coastal waters of that Administration. In this case, U.S.-credentialed mariners will be allowed to utilize STCW near-coastal endorsements to work on U.S. vessels only when engaged on near-coastal voyages as defined by that foreign Administration. Under no circumstances shall the 200-nautical mile limitation on a credential be increased.
 - (a) While the U.S. is in the process of entering into a bi-lateral agreement described in paragraph (2) above and U.S. documented vessels regularly engage on near-coastal voyages off the coast of another Administration, the United States' near-coastal endorsement may be used until a bi-lateral agreement can be implemented. In these cases, a U.S.-near-coastal endorsement with a corresponding STCW endorsement should be sufficient for service within any limitations specified on the credential until a bi-lateral agreement between the two countries is implemented.
 - (b) If a foreign Administration has not defined near-coastal voyages or proposed variations to the STCW competence, U.S.-credentialed seafarers serving on vessels regularly engaged in the vicinity of that foreign Administration should hold the appropriate STCW endorsement and meet the STCW competence applicable to seafarers serving on ships not engaged on near-coastal voyages. This is consistent with the STCW provisions of Regulation I/3, paragraph 3, that requires that Administrations for ships that are regularly engaged on near-coastal voyages off the coast of another Party, may prescribe requirements that are at least equal to those of the Party off whose coast the ship is engaged.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

- (c) If a foreign Administration declines to enter into a bi-lateral agreement, but has established near-coastal voyage variations, in compliance with paragraph 1 of STCW Regulation I/3, U.S.-credentialed seafarers may serve on a U.S.-vessel under the authority of a U.S.-issued near-coastal STCW endorsement. Where a mariner is serving on a near-coastal endorsement, he or she should still comply with the near-coastal limitations established by the foreign Administration and, in no case, should that limitation be increased to more than 200 nautical miles.
- (d) The Coast Guard will advise the maritime industry when the United States has entered into bi-lateral agreements with foreign Administrations as described above. The vessel owner/operator and master should be aware of the coastal state's requirements for vessels engaged on near-coastal voyages off the coast of another Party.
- (e) Enforcement of the Canadian Marine Personnel Regulations took effect on October 26, 2013 for U.S. vessels in Canadian waters. These regulations apply to U.S. vessels operating in Canadian waters when enroute to a Canadian port or place. The Canadian regulations stipulate that an individual on watch must hold a certificate/license appropriate to the class of vessel for the voyages on which the vessel is engaged. Although not required by U.S. regulations, the Canadian regulations require that, irrespective of tonnage or length, the authorized representative of a vessel shall ensure that its crew complement consist of an individual credentialed to be in charge of the vessel's machinery unless the vessel has a propulsive power of less than 750 kW (1,000 hp). Accordingly, all personnel (including additional engineering personnel employed to comply with the Canadian regulations) must hold a valid Merchant Mariner Credential issued by the U.S. Although the Canadian Marine Personnel Regulations call for certification in accordance with the International Convention of Standards of Training, Certification and Watchkeeping for Seafarers (STCW), Transport Canada and the Coast Guard have executed a memorandum of understanding (MOU) for the mutual recognition of personnel licensure and certification applicable to each nation's trading vessels while trading in the domestic waters of either the United States or Canada. Therefore, personnel are not required to obtain STCW endorsements when operating in the domestic waters of either the United States or Canada. The following notes may apply when preparing safe manning documentation for subject vessels;
- 1) For certain vessels of less than 200 GRT (or uninspected vessels operating exclusively inward of the Boundary Lines) on voyages to Canada, the Certificate of Inspection or safe manning document may be endorsed to the effect of;

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

*CHIEF ENGINEER, ASSISTANT ENGINEERS, OR DESIGNATED DUTY ENGINEERS NOT REQUIRED OTHER THAN ON VOYAGES TO CANADA IN ACCORDANCE WITH DIVISION 4 OF THE CANADIAN MARINE PERSONNEL REGULATIONS.

NOTE: See USCG MSIB 021-12 for additional information. (2014)

- 2) For vessels trading exclusively between the United States and Canada, all references to STCW including the “STCW Grade/Capacity” and “STCW Regulation” fields on the safe manning documentation may be omitted as “N/A” if the “Trading Area” is limited to “Inland U.S./Canada,” “Near-Coastal U.S./Canada,” or “Great Lakes” exclusively.
 - 3) For uninspected towing vessels to receive safe manning documentation endorsed for Periodically Unattended Machinery Space (PUMS), operators may present the OCMI with a Certificate of Class appropriately endorsed for unattended machinery status or meet the U.S. requirements (e.g. 46 CFR Part 62). Alternatively, as Part 62 and MSM Volume III Chapter B6 are not necessarily applicable to uninspected vessels, NVIC 1-78 may be used to establish PUMS.
- e. Exclusive Great Lakes And Inland Voyages. (2014)
The Coast Guard does not consider STCW to apply directly to personnel serving on U.S. vessels operating exclusively on the Great Lakes or other inland waters (see 61 FR 95-062, 59 [March 26, 1996]).
3. International Convention On Tonnage Measurement Of Ships, 1969 (ITC). (2014, 2017)
With the 1995 Amendments to STCW coming into force on 1 February 2002, absent explicit authorization to the contrary, GT ITC is the applicable tonnage for the application of STCW and IMO Resolution A.540(13) is no longer applicable (see the Annex of IMO Resolution A.1073(28), Recommendation on the Use of National Tonnage in Applying International Conventions, adopted 4 December 2013). Accordingly, with the exception of U.S. vessels of less than 1600 GRT operating exclusively to and from U.S. ports (see paragraph B.3.b of this Chapter), use of Regulatory Measurement System tonnages for this purpose is no longer authorized (see ANNEX-22 for COI formatting). See also Appendix 10 of IMO Resolution A.1052(27), Procedures for Port State Control, 2011, adopted 30 November 2011. Therefore, regardless of tonnage, vessels engaged upon international voyages should be manned with appropriately credentialed mariners in accordance with STCW as reflected in the Certificate of Inspection or safe manning documentation. (See paragraph B.1 of this Chapter for discussion on the application of tonnage as the basis for determining the required number of credentialed officers in a crew complement.)

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**Figure B3-1: Tonnage Applicability: Dual-Tonnage Vessels^[1,2,3] (2017)

This figure clarifies that for vessels measured under both 46 U.S.C. Chapters 143 and 145, the Regulatory Measurement System (GRT) is used to determine the number of crew required and, in certain cases depending on voyage and vessel particulars, the Convention Measurement System (GT ITC) is applied for determining the tonnage level of MMC/STCW endorsements.

	Manning: Crew Complement (#)	Credentialing: MMC/STCW Endorsement Tonnage Level
Domestic Voyage / Shoreward - U.S. Boundary Line ^[4] / Any Tons	GRT	GRT
Operates Exclusively to and from U.S. Ports / Seaward - U.S. Boundary Line / < 1600 GRT	GRT	GRT ^[5]
Domestic Voyage / Seaward - U.S. Boundary Line / > 1600 GRT	GRT	GT ITC
International Voyage ^[6] / Seaward - U.S. Boundary Line / Any Tons	GRT	GT ITC

¹For vessels measured solely under the Regulatory Measurement System, the GRT is used to apply manning and credentialing requirements.

²See 46 CFR Part 69, Subpart D, for vessels measured under the Dual Regulatory Measurement System. Specifically, 46 CFR 69.153(a) for the application of manning laws and regulations.

³For vessels measured solely under the Convention Measurement System, the GT ITC is used to apply manning and credentialing requirements.

⁴Including the Great Lakes

⁵GRT is applied to determine the tonnage level of STCW Endorsements for vessels of less than 1600 GRT that operate exclusively to and from U.S. ports.

⁶For voyages to Canada see paragraph B.2.d.(2)(e) of this Chapter.

a. ITC Impact On Specific Vessels. (2014)

Small passenger vessels (SPV) and seagoing tugs are most significantly affected by the ITC. Consider, for example, the impact on a new small passenger vessel which measures in excess of 2500 GT ITC, but measures only 99 GRT by the Regulatory Measurement System. If the vessel remains exclusively in domestic service the master and mates must hold 100 GRT endorsements. If the same vessel engages in international voyages the master and mates must hold credentials with a minimum of 3000 GT ITC endorsements. In essence, the officers of this vessel would need to hold significantly higher-level endorsements when on vessels or voyages subject to STCW.

b. Application of STCW Domestically. (2014)

The Coast Guard has established arrangements for the implementation of STCW domestically, including the application of the Regulatory Measurement System (GRT) in determining the applicability of STCW to mariners employed on U.S. flag vessels

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

of more than 200 GRT (500 GT ITC if GRT is not assigned) but less than 1600 GRT that operate beyond the boundary line and exclusively to and from U.S. ports (excluding operations from a foreign port) (see 62 FR 95-062, 123 [June 26, 1997]). Further, in accordance with NVIC 7-00 and 46 CFR 15.105(g)(2), it is the policy of the Coast Guard that some variance is appropriate for personnel serving on U.S. flag vessels less than 200 GRT (500 GT ITC if GRT is not assigned) on domestic voyages beyond the boundary line. The Coast Guard has specifically determined that, for certain small vessels on domestic near-coastal voyages, the scheme of safety provided by the current credentialing program and the inspection and oversight programs for small vessels deliver a level of safety comparable to STCW.

4. The International Convention For Safety Of Life At Sea (SOLAS). (2014, 2017)
The IMO provisions relating to safe manning are covered by regulation in Chapter V of the International Convention for the Safety of Life at Sea (SOLAS), 1974, whose requirements are supported by IMO Resolution A.1047(27) Principles of Safe Manning, adopted in 2011. Specifically, SOLAS Chapter V, Regulation 14 requires each vessel to which Chapter I of SOLAS applies to be "sufficiently and efficiently" manned as evidenced by a Safe Manning Document (SMD) issued by the flag-state. It is important to distinguish between the Principles of Safe Manning, IMO Resolution A.1047(27), and the requirement to maintain a SMD found in SOLAS Chapter V/14. The principles of safe manning apply to all vessels, regardless of size, as a guideline. The requirement to possess a flag-state issued SMD applies to vessels subject to Chapter I of SOLAS (e.g. cargo vessels of 500 GT ITC or more, absent explicit authorization to the contrary, and passenger vessels). To avoid adverse Port State Control action (e.g. detention), regardless of the SMD applicability, operators of vessels on international voyages should observe the guidelines pertaining to the principles of safe manning.
 - a. Inspected Vessels. (2014)
For U.S. flagged inspected vessels, the Certificate of Inspection (COI) serves as the safe manning document. The COI states the minimum number of credentialed officers and crewmembers necessary for the safe operation of inspected vessels, as required by 46 U.S.C. 8101, 46 CFR 15.105 and 15.501.
 - b. Uninspected Vessels. (2014)
It is the responsibility of the owner/operator to ensure that each vessel under their management complies with the manning, certification, and watchkeeping requirements in accordance with all applicable statutes and regulations.
 - (1) Although they are not provided with a COI, certain uninspected vessels that engage on international voyages are required to carry a SMD in accordance with SOLAS Chapter V/14 and should apply for one via the cognizant Coast Guard OCMI (46 CFR 15.105). When requesting a SMD, owners/operators should refer to Chapter B1 for additional guidance. When preparing a SMD, the OCMI should follow the sample format provided in the Annex to this Volume.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

- (2) When engaged on international voyages, those uninspected vessels which are not subject to the specific requirements of SOLAS Chapter V/14 are encouraged to request a permissive SML to document flag-state approval of the vessel's manning levels. The SML provides objective evidence to port-state authorities that the subject vessel meets the minimum safe manning requirements as determined by the Flag State. When requesting a SML, owners/operators should refer to Chapter B1 for additional guidance. When preparing a SML, the OCMI should follow the sample format provided in the Annex to this Volume.

5. Principles Of Safe Manning. (2014, 2017)

In establishing the safe manning level to assure a vessel is sufficiently and efficiently manned, SOLAS makes reference to IMO Resolution A.1047(27) which establishes the principles of safe manning and prescribes the form and content of the safe manning document. Resolution A.1047(27) suggests that, except in ships of limited size and limited propulsion power or operating under provisions for unattended machinery spaces, manning levels should be based on the presumption that the master and chief engineer do not stand watch under normal circumstances. It further suggests, subject to exceptions, watchstanders should normally be divided into three watches; and that lookout and helmsman duties are separate (see Section A-VIII/2 of the STCW Code). Refer to Chapters B2 [Manning and STCW Certification Reference Tables (Seagoing Vessels)], B5, and B7 for additional discussion on vessels permitted to maintain a two-watch system.

C. Masters. (2014)

The provisions of 46 U.S.C. 8301, 8304, and 8902, as well as 46 CFR 15.805, require certain self-propelled vessels to have the full-time services of a master. Various statutes, regulations, and customs place continuing responsibilities upon the master of a vessel, whether underway, at anchor, moored, or handling cargo. Except aboard vessels of limited size, or on vessels having dedicated limited routes, these responsibilities cannot be properly discharged when the master is in charge of a watch. It is not therefore expected that the master will stand watches in the regular routine of the vessel, except on vessels of 1,000 GRT or less.

D. Mates. (2014)

A number of statutory provisions in Title 46, U.S. Code, as well as 46 CFR 15.810, dictate the minimum number of credentialed mates required for a vessel. The statutes predominately specify manning level based upon watchkeeping requirements. In establishing the minimum number of mates required for safe operation, the Officer in Charge, Marine Inspection (OCMI) should consider a vessel's total operational requirements, such as cargo handling, emergency evolutions, navigational challenges to include vessel congestion and Vessel Traffic Service areas, visibility restrictions, proximity to navigational hazards, and preventive maintenance in addition to mandated levels of manning. The sample manning scales in Chapters B2 and B7 have been prepared following this philosophy.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

1. Minimum Number Of Mates. (2014, 2017)
 46 U.S.C. 8301 requires a minimum number of mates based on vessel tonnage, length of voyage, and in some cases upon vessel type. These mate manning levels are not discretionary. An OCMI may not authorize fewer mates than provided within this statutory section. As provided in 46 CFR 15.810(f), Commandant (CG-CVC) may consider reductions to the number of mates required when special circumstances allowing a vessel to be safely operated can be demonstrated. Special circumstances may include a national emergency as proclaimed by the President or for the purposes of national defense. However, this does not extend to altering the watch system requirements of 46 U.S.C. 8104 (see 46 U.S.C.A. 8104, 2007, Notes of Decision, Note 6. Number of Watches). Requests should be routed via the OCMI.
 - a. On vessels subject to STCW, the individual meeting the requirement of this section must also hold an STCW endorsement as officer in charge of a navigational watch with the appropriate tonnage for the vessel upon which he or she is operating, except as noted in §15.105(g) of this part for vessels on domestic near-coastal voyages.

2. Master, Mate, Or Engineer Officer Requirement. (2014)
 - a. 46 U.S.C. 8304 requires persons serving as master, mate, or engineer on any vessel of 200 GRT or more operating on the high seas (e.g., beyond the boundary line) to hold a license or MMC officer endorsement appropriate for the route and tonnage of the vessel.
 - b. The above notwithstanding, neither the statute nor the implementing regulations expressly specify the grade of credential required to fill either the requirement for mate or engineer. Chapter B2 of this Volume does provide delineation in respect to the suggested grades for the sample manning scales. In STCW, there is little discretion in specifying the manning levels for vessels subject to the provisions of STCW in relation to the mandatory minimum requirements for certification in the management level capacities. However, in the case of the operational level, STCW makes no delineation between 2nd or 3rd Mate (only OICNW-II/1) and 2nd [U.S.] or 3rd assistant engineer (only OICEW-III/1). In this case, the grade for the mates and engineers at the operational level are variables for the OCMI to consider when establishing the manning level. In doing so, the OCMI should consider the job descriptions and responsibilities for all positions as identified and defined in the relevant safety management system.

3. Working Conditions And Watch Requirements. (2014)
 46 U.S.C. 8104 has a number of subsections concerning working conditions and watch requirements that may result in a higher number of mates being assigned than might otherwise be required by 46 U.S.C. 8301.
 - a. Section 8104(a) requires a minimum rest period for the officer in charge of the navigation watch upon a vessel's departure from port or immediately after the vessel departs. A sufficient number of mates must be assigned to ensure all in-port duties may be accomplished safely and a rested crew is available for departure. 46 CFR

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

15.1109 and 15.1111 also provide provisions on watches, work hours, and rest periods for vessels operating beyond the boundary line.

- b. Section 8104(b) provides that credentialed officers on a seagoing vessel of not more than 100 GRT may not be required to work more than 12 hours in a 24-hour period at sea. The Coast Guard, in 46 CFR 15.1111, requires manning levels to ensure that every person assigned duty as officer in charge of a navigational or engineering watch, or duty as ratings forming part of a navigational or engineering watch, or designated safety, prevention of pollution, and security duties onboard any vessel that operates beyond the boundary line must receive:

- (1) a minimum of 10 hours of rest in any 24-hour period; and
- (2) 77 hours of rest in any 7-day period.

Under 46 CFR 15.810, a credentialed mate is normally required in addition to the master. If the voyages do not exceed 12 hours in duration, the OCMI has the discretion to determine if the vessel can be safely operated without a licensed/credentialed mate. The extent of the master's duties in port should be considered when making this determination. If no mate is required and the vessel operates more than 12 hours in a 24-hour period then an alternate crew must be provided to ensure safe operation while the vessel is underway.

- c. Section 8104(c) provides that credentialed officers and unlicensed seamen on Great Lakes towing vessels cannot be required to work more than 8 hours in a day.
- d. Section 8104(d) provides that the credentialed officers and certain unlicensed crew positions on seagoing and Great Lakes vessels of more than 100 GRT must be divided into at least three watches. Therefore, unless the master also stands watch, at least three mates would be required on such vessels. Section 8104(g) modifies this requirement in that it allows a 2-watch system for the credentialed officers and certain crewmembers on seagoing towing vessels, OSVs, and barges engaged on voyages of less than 600 nautical miles.
- e. Sections 8104(k) and (l) require either a 3-watch or 2-watch system for certain fish processing vessels based on inspection requirements, gross tonnage and service entry dates. Section 8104(m) exempts certain fish processing vessels from the above watch system requirements. (See Chapter B5 for watchkeeping arrangements and work hour limits; also see Chapter B7 for uninspected fishing industry vessels manning requirements.)
- f. Section 8104(n) limits a credentialed officer or seamen on a tanker from working more than 15 hours in any 24-hour period. In effect, Section 8104(n) imposes an average work limit of 12 hours in a 24-hour period for credentialed officers or seamen on tankers. OCMI should particularly take this factor into account in establishing

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

tanker manning. (See detailed discussion of work hour limits in Chapters B5 and B7 of this Volume.)

- g. Section 8104(o) imposes a 3-watch or 2-watch system for fish tender vessels engaged in the Aleutian trade depending on gross tonnages and entry date or purchase date to serve in the trade.

4. COI/SMD Manning Format – Mates. (2014, 2017)

- a. For vessels of 1600 GRT (3000 GT ITC if GRT is not assigned) or more, the grade of endorsement required for service in the capacity of mate should be indicated in the manning block of the COI or SMD, unless trade restricted endorsements are permitted (see Chapter C2).

Example:

Masters:	1	NOTE: Format the COI with Master First Class Pilot and Mate First Class Pilot for vessels subject to the first-class pilot (FCP) regulations, which operate exclusively within the designated areas of Federal pilotage waters (e.g., Great Lakes). Unless requested, it is not necessary to endorse the COI for first-class pilotage if a transient vessel subject to the FCP regulations is otherwise in compliance. See Section B3.I for details. (2017)
Chief Mates:	1	
Second Mates:	1	
Third Mates:	1	

- b. For vessels of less than 1600 GRT (3000 GT ITC if GRT is not assigned), only the number of mates is required to be indicated in the manning block of the COI or SMD. An endorsement as Chief, Second, or Third Mate authorizes service as a mate where the grade level is not specified.

Example:

Masters:	1
Licensed Mates:	3

E. Chief Engineer.

1. Inspected Mechanically Propelled Vessels (46 CFR 15.820(a)). (2014)

Title 46 CFR 15.820 requires that there be an individual holding an appropriate MMC or license endorsed as chief engineer or other credential authorizing service as chief engineer employed on board the following inspected mechanically propelled vessels:

- a. Seagoing vessels of 200 GRT and over;
- b. Offshore supply vessels of more than 200 GRT; and
- c. Inland (other than Great Lakes) vessels of 300 GRT or more, if the OCMI determines that an individual with a license or the appropriate MMC officer endorsement responsible for the vessel's mechanical propulsion is necessary.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

2. Uninspected Mechanically Propelled Vessels (46 CFR 15.820(b)). (2014)
An individual engaged or employed to perform the duties of chief engineer on a mechanically propelled, uninspected, seagoing, documented vessel of 200 GRT or over must hold an appropriately endorsed license or MMC authorizing service as a chief engineer.
3. On Vessels Subject To STCW. (2014)
Individuals meeting the requirements of this section must also hold an STCW endorsement as chief engineer with the appropriate propulsion power for the vessel upon which he or she is operating, except as noted in 46 CFR 15.105(g) for vessels on domestic near-coastal voyages.

F. Engineers. (2014)

Under 46 U.S.C. 8301, a credentialed engineer must be employed aboard every seagoing vessel of 300 GRT, propelled by machinery, which carries freight or passengers. Further, section 8304 and 46 CFR 15.825 require persons serving as engineers on most seagoing vessels of 200 GRT or more to hold a license or MMC officer endorsement. Although 46 U.S.C. 8101 does permit discretion in establishing a manning scale, the following limitations must be strictly observed in exercising this discretion (see Chapter B6.A.3 for automation):

1. Oceangoing Or Coastwise Vessels Of 200 GRT Or More. (2014)
Taking into account the applications of 46 U.S.C. 8104(d) and 8304(c), the requirements are as described in paragraph B3.F. There should be at least three licensed/credentialed engineers assigned to seagoing vessels of more than 100 GRT to be divided into at least three watches per 46 U.S.C. 8104(d), unless the vessel is automated (Chapter B6.A.3). On a towing vessel, an offshore supply vessel, or a barge to which 46 U.S.C. 8104(g) applies, which are engaged on a voyage of less than 600 miles, the number of licensed/credentialed engineers may be reduced to two and divided, when at sea, into at least two watches.
2. Oceangoing Or Coastwise Vessels Of Less Than 200 GRT (Not Subject To 46 U.S.C. 8301), Except Those Covered By 46 CFR 15.105(g). (2014)
Credentialed engineers are not required by statute. However and regardless of tonnage or inspection status, if, by the nature of a vessel's engineering systems and functionality, an individual is necessarily engaged to perform engineering duties on board a seagoing vessel (subject to STCW, see paragraph B.2.d. of this Chapter), driven by main propulsion machinery of 750kW (1,000 hp) propulsion power or more, then that individual shall hold a valid STCW certificate or endorsement issued in accordance with 46 CFR Part 11 or 12. The failure to ensure that individuals are appropriately certificated in accordance with STCW may result in a violation of 46 CFR 15.1103. The identification of necessary marine engineering tasks, duties, and responsibilities is an important factor for safe vessel operations and a critical component to consider when carrying out manning assessments. The degree of system automation and human interaction/control, and the watchkeeping provisions must also be taken into consideration. Owners/operators are encouraged to coordinate with the cognizant OCMI to ensure that subject vessels are safely manned in accordance with the applicable requirements by appropriately certificated mariners.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

Additional information concerning manning requirements, assessments, and proposals can be found in Chapter B1.

3. Inspected Inland Vessels Of 300 GRT Or More. (2014)

The number of credentialed engineers required must be at least one. Although not required by law, typically an individual endorsed as chief engineer or an endorsement authorizing service as chief engineer (e.g., designated duty engineer) should be assigned. [46 CFR 15.820(a)(3)]

4. Inspected Inland Vessels Of Less Than 300 GRT. (2014)

The scale may vary, from no requirement to a number adequate for the safe operation of the propulsion plant as determined necessary by the OCMI. Automated engineering systems should meet the criteria of 46 CFR Part 62, Navigation and Vessel Inspection Circulars (NVICs) 1-69, 1-78, or 6-84, and the provisions of Chapter B6 of this Volume.

NOTE: Aboard non-seagoing vessels less than 200 GRT, a credentialed chief engineer is not required. Aboard such vessels, the grade(s) of credentialed engineer(s) required by the OCMI shall be commensurate with the vessel's route, the complexity of the engineering plant, and watch system requirements. (2014)

5. On vessels subject to STCW. (2014)

On vessels subject to STCW, the individual meeting the requirement of this section must also hold an STCW endorsement as officer in charge of an engineering watch with the appropriate propulsion power for the vessel upon which he or she is operating, except as noted in §15.105(g) of this part for vessels on domestic near-coastal voyages.

6. COI/SMD Manning Format –Engineers. (2014, 2017)

a. For vessels of 1600 GRT (3000 GT ITC if GRT is not assigned) or more, the grade of endorsement required for service in the capacity of assistant engineer should be indicated in the manning block of the COI or SMD, unless trade restricted endorsements are permitted (see Chapter C2).

Example:

Chief Engineers:	1
First Assistant Engineers:	1
Second Assistant Engineers:	1
Third Assistant Engineers:	1

b. For vessels of less than 1600 GRT (3000 GT ITC if GRT is not assigned), only the number of assistant engineers is required to be indicated in the manning block of the COI or SMD. An endorsement as First, Second, or Third Assistant Engineer authorizes service as an assistant engineer where the grade level is not specified.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

Example:

Chief Engineers:	1
Licensed Engineers:	3

G. Master And Mate (Pilot) Of Towing Vessels (see 46 CFR 15.805(a)(5) & 15.810(d)).
(2014, 2017)

Title 46 CFR 15.535(b) and 15.610(a) require that every towing vessel of at least 8 meters (at least 26 feet) in length, measured from end to end over the deck (excluding sheer), must be under the direction and control of a person holding a license or MMC officer endorsement as master or mate (pilot) of towing vessels or as master or mate of vessels of greater than 200 GRT holding either -

1. An endorsement on his or her license or MMC for towing vessels: or
2. a completed Towing Officer's Assessment Record (TOAR) signed by a U.S. Coast Guard approved designated examiner indicating that the officer is proficient in the operation of towing vessels.

This requirement does not apply to any vessel engaged in assistance towing. Because STCW has no specific provisions for towing vessels, seafarers should be certificated and duly endorsed in accordance with STCW for the applicable tonnage, propulsion power, and intended route of service. Refer to Chapter B2 for Manning and STCW Certification Reference Tables and 46 CFR 15.610(a).

Towing vessels are subject to various manning requirements depending largely on route, tonnage, service, and inspection status. The Towing Endorsement Table provides context on which towing endorsements or combinations thereof, are required for various operations. Accordingly, the COI or SMD/SML may be annotated with the applicable Towing Endorsement Category(s) [from the column headers in Figure B3-2] to reflect which towing endorsements are acceptable for service as indicated in the Table below. For example, the COI for an inspected, seagoing, towing vessel (>300 GRT) may be annotated as;
“Towing Endorsement: Master/Mate endorsement authorizing service on vessels of more than 200 GRT (of appropriate route/tonnage) w/TOAR for the route and familiarization OR Master/Mate endorsement authorizing service on vessels of more than 200 GRT(of appropriate route/tonnage) and Master/Mate Towing Vessel of appropriate route/tonnage.”

Apprentice mate (steersman) may not fill the manning requirements of a towing vessel (46 CFR 10.107).

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

Figure B3-2: Towing Endorsement Table (2014, 2017)

Operations	Towing Endorsement Categories			
	Master/Mate Towing Vessel of appropriate route/tonnage ^[1]	Master/Mate endorsement authorizing service on vessels of more than 200 GRT (of appropriate route/tonnage) w/TOAR and familiarization ^[2]	Master/Mate endorsement authorizing service on vessels of more than 200 GRT (of appropriate route/tonnage) <u>and</u> Master/Mate Towing Vessel of appropriate route/tonnage	License or MMC authorizing assistance towing
UTV or Subchapter M, non-seagoing, towing vessel (>200 GRT):	X, or	X	-	-
UTV or Subchapter M, non-seagoing, towing vessel (≤200 GRT):	X, or	X	-	-
UTV or Subchapter M, seagoing, towing vessel (<300 GRT):	X, or	X	-	-
Inspected, seagoing motor vessel engaged in towing (≥300 GRT):	-	X, or	X	-
Other inspected vessel engaged in towing (>200 GRT):	-	X, or	X	-
Other inspected vessel engaged in towing (≤200 GRT):	X, or	X	-	-
Assistance towing vessel	X, or	X, or	X, or	X

SPECIFIC NOTES:

¹Master/mate of towing vessels, limited means an endorsement to operate a towing vessel of less than 200 GRT only within a local area on the Great Lakes, Inland Waters, or Western Rivers designated by the OCMI [46 CFR 11.463(c)].

²For additional information on familiarization, see observation and training requirements in 46 CFR 11.464 and 11.465.

GENERAL NOTES: Includes dual-mode and push-mode ITBs / ATBs.

Push-mode = aggregate tonnage of the combination. STCW may apply depending on route.

Seagoing = operating beyond the boundary line, as described in 46 CFR Part 7. For passenger-carrying barges under tow, see Chapter B2 Section D.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS****H. Operator Of Uninspected Passenger Vessels (OUPV). (2014, 2017)**

Title 46 U.S.C. 8903 requires an uninspected passenger vessel to be operated by a credentialed individual as prescribed by regulation.

1. Title 46 CFR 15.605(a) requires every self-propelled uninspected passenger vessel defined by 46 U.S.C. 2101(42)(B) to be under the "direction and control" of an individual holding a license or MMC endorsed as operator of uninspected passenger vessels.
2. Title 46 CFR 15.605(b) requires every uninspected passenger vessel of 100 GRT or more, as defined by 46 U.S.C. 2101(42)(A), to be under the "direction and control" of a credentialed master, pilot, or mate as appropriate.

The intent is that the vessel must be under the physical control or direct supervision of an appropriately endorsed individual. 46 U.S.C. 8104(b) provides that licensed individuals (credentialed officers) on oceangoing vessels of not more than 100 GRT "may not be required" to work more than 12 hours in a 24-hour period while at sea. Credentialed operators serving as OUPV may voluntarily work more than 12 hours in a 24-hour period. However, OCMI's should strongly encourage uninspected passenger vessels operating in excess of 12 hours to have at least two credentialed operators assigned to prevent fatigue. It has been suggested by some operators that a qualified seaman could be left at the helm while the credentialed operator sleeps close by. This position is untenable. As noted above, 46 U.S.C. 8903 mandates the vessel be operated by a licensed individual; the Coast Guard does not have the discretion to allow any unlicensed seaman to control the vessel without supervision. (See Chapters B5 and B7 for further discussion regarding working conditions for these vessels.)

NOTE: An endorsement as OUPV for near-coastal waters limits the holder to service on domestic, near-coastal waters not more than 100 miles offshore, the Great Lakes, and all inland waters. Endorsements issued for inland waters include all inland waters except the Great Lakes (46 CFR 11.467(b)). Endorsements may be issued for a particular local area under 46 CFR 11.467(f) or (g). Personnel serving on Uninspected Passenger Vessels engaged on international voyages must meet the requirements of 46 CFR Part 15 Subpart K. (2017)

I. Pilots. (2014, 2017)

Normally, foreign vessels and U.S. vessels operating on a registry endorsement are under State pilotage authority, and U.S. vessels operating on a coastwise endorsement are under Federal pilotage authority (see 60 FR 20651 [April 27, 1995]). There are two exceptions. The first occurs on the Great Lakes, where all vessels are subject to Federal pilotage under 46 U.S.C. Chapter 93. The second exception occurs where a state fails to provide for pilotage under 46 U.S.C. 8503. In this case, the assertion of Federal pilotage requirements will expressly appear by regulation in 46 CFR Part 15, Subpart J and applies to vessels in foreign trade.

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**1. Federal Pilotage (*pilotage waters*). (2014, 2017)

46 U.S.C. 8502 requires a coastwise seagoing vessel, not sailing on register, to be under the direction and control of a pilot credentialed by the Coast Guard when underway on U.S. navigable waters (i.e., *pilotage waters*). A coastwise seagoing vessel generally means one which is engaged, or authorized by its documentation to be, in domestic trade between one U.S. port and another (for additional information, including Outer Continental Shelf and coastwise points applicability, see U.S. Customs and Border Protection Informed Compliance Publication, *Coastwise Trade: Merchandise* [January 2009] and 60 FR 57633 [November 16, 1995]). A U.S. documented vessel with only a registry endorsement on its COD would generally be subject to State pilotage authority. For dual or multi-documented vessels, the endorsement authority is determined by examining the voyage leg upon which it is engaged at any given time. For additional information see 46 CFR 15.812, NVIC 8-94 and Part A Chapter 11 of this Volume. For "acting as" pilots (master or mate) specifically 46 CFR 15.812(b)(2), which applies to certain vessels of not more than 1,600 GRT as well as those in non-designated areas of pilotage waters. Quick Reference Tables 15.812(e)(1) and (2) provide a guide to the pilotage requirements for inspected self-propelled coastwise seagoing vessels and coastwise seagoing tank barges (not sailing on register). See 46 U.S.C. 8502(i) for dredge exemptions.

2. First-Class Pilot (*designated areas of pilotage waters*). (2017)

Generally, an individual holding a MMC endorsed as a first-class pilot is compulsory for inspected self-propelled coastwise seagoing vessels greater than 1,600 GRT and coastwise seagoing tank barges greater than 10,000 GRT operating in designated areas of pilotage waters. GT ITC is used if GRT is not assigned. *Designated areas* are those areas within pilotage waters for which first-class pilot's endorsements are issued under 46 CFR Part 11, Subpart G. The areas for which first-class pilot's endorsements are issued within a particular Marine Inspection Zone and the specific requirements to obtain them may be obtained from the OCMI concerned.

a. See 61 FR 68090 [December 26, 1996] for a list of the Eighth District designated areas for which first class pilots endorsements are required.

b. See 46 CFR 15.812(f) for Prince William Sound, Alaska.

J. Radar Observers. (2014, 2017)

Title 46 CFR 15.815 requires that each person in the required complement of deck officers, including the master, on inspected vessels of 300 GRT or over which are radar equipped, shall hold an endorsement as radar observer. Additionally, each person having to hold a license or MMC officer endorsement under 46 U.S.C. 8904(a) for employment or service as master or mate on board a towing vessel of 8 meters (approximately 26 feet) or more in length must, if the vessel is equipped with radar, hold an endorsement as radar observer. Each person who is required to hold a radar endorsement must have his or her certificate of training readily available to demonstrate that the endorsement is still valid. Readily available means that the documentation must be provided to the Coast Guard, or other appropriate Federal

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

agency, within 48 hours of a request by the Coast Guard or other agency. The documentation may be provided by the individual, or his or her company representative, electronically, by facsimile, or physical copy. Under 46 CFR 11.480, a radar observer endorsement is valid for 5 years from the date of issuance of the certificate of training from a course approved by the Coast Guard.

K. Automatic Radar Plotting Aid (ARPA). (2014)

Title 46 CFR 15.816 requires that every person in the required complement of deck officers, including the master, on seagoing vessels equipped with automatic radar plotting aids (ARPAs), except those vessels listed in 15.105(f) and (g), must hold an appropriate STCW endorsement valid for vessels equipped with ARPA. If an individual has not received ARPA training, this will be noted on the endorsement as a limitation. A valid MMC without an ARPA limitation is evidence that an officer has completed training in ARPA. See 33 CFR 164.38 for additional requirements pertaining to ARPAs.

L. Radio Officers. (2014)

The requirements for various items of radio communications equipment are controlled primarily by the Federal Communications Commission (FCC). Primary attention must be given to radiotelegraph officers and GMDSS operators, who are licensed by the FCC and the Coast Guard (see 46 U.S.C. Chapter 71 and Section 7318); the requirement for such persons shall be noted on the vessel's Certificate of Inspection (COI) or SMD/SML.

NOTE: This is considered only a reinforcement of FCC authority.

On smaller vessels, radiotelephone installations are permitted; as radiotelephone operators are licensed solely by the FCC, their presence is not required on the COI (FCC requirements for equipment and personnel qualifications are contained in Title 47, CFR).

1. General. (2014)

The controlling authority for radio operators and installations aboard U.S. vessels is generally a function of the FCC. The operation of transmitters of most vessel stations must be performed by a person holding a commercial radio operator license or permit of the class as specified in 47 CFR Parts 13 and 80, Subpart D. Reference MSM Volume II Section B.1.M for additional information.

2. Global Maritime Distress And Safety System (GMDSS). (2014)

46 CFR 15.817 requires that every person in the required complement of deck officers, including the master, on seagoing vessels equipped with a GMDSS, except those vessels listed in 46 CFR 15.105(f) and (g), must provide evidence of a valid STCW endorsement as GMDSS radio operator. For example, if a master and three mates (OICNW) are required then each should be certificated in accordance with STCW IV/2 as GMDSS Radio Operators. This should be reflected on the COI or SMD, as applicable. Similarly, Vessels voluntarily relying on the at-sea maintenance provision of the GMDSS must have

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

onboard a licensed GMDSS Radio Maintainer (See 46 CFR 15.818 and 15.1103(e)). Reference MSM Volume II Section E.2.K for additional information.

3. FCC Commercial Radio Operator Licenses (Term of License). (2014)

FCC Radiotelegraph Operator License: Effective May 20, 2013, First and Second Class Radiotelegraph Operator's Certificates will be renewed as Radiotelegraph Operator Licenses valid for the lifetime of the holder, and Third Class Radiotelegraph Operator's Certificates will be renewed as Marine Radio Operator Permits valid for the lifetime of the holder.

GMDSS Radio Operator/Maintainer License (DO, DM, DB): Issued for the holder's lifetime. Prior to March 25, 2008 the license term for was five years. Any holder of a DO that expired prior to March 25, 2008, must still file an application to renew the FCC license within the five-year grace period after expiration.

M. Vessel Security Officer. (2014)

Refer to 46 CFR 15.1113(a) for the Vessel Security Officer STCW requirements. Reference 33 CFR 104.215 for all other vessels subject to 33 CFR Part 104.

N. Personnel With Designated Security Duties. (2014, 2017)

Refer to 46 CFR 15.1113(c) for the STCW requirements applicable to personnel with designated security duties on seagoing vessels which are required to comply with the provisions of the ISPS Code. Reference 33 CFR 104.220 for all other vessels subject to 33 CFR Part 104. See Port Security Advisory 5-09, as amended, for the Minimum Guidelines for Contracted Security Services in High Risk Waters.

O. Security Awareness. (2014)

Refer to 46 CFR 15.1113(e) and (f) for the STCW requirements applicable to security awareness training on seagoing vessels which are required to comply with the provisions of the ISPS Code. Reference 33 CFR 104.225 for all other vessels subject to 33 CFR Part 104.

P. Transportation Worker Identification Credential (TWIC). (2014)

Prior to the Coast Guard Authorization Act of 2010 ("Act"), all mariners required to hold a Merchant Mariner Credential (MMC) were also required to obtain and hold a valid TWIC. Section 809 of the Act, however, permits the Secretary, acting through the Coast Guard, to exempt any mariner who does not require unescorted access to a secure area of a vessel from the requirement to hold a valid TWIC as a precondition of receiving and holding a MMC. Accordingly, the Coast Guard is allowing mariners without a valid TWIC who operate on board vessels that do not have a security plan to acquire and renew a MMC. Specifically, this policy applies to mariners who are inactive or not operating under the authority of their credential, as well as those who serve on vessels that are NOT required to have a vessel security plan. When inspecting subject vessels, the Coast Guard has adjusted its enforcement

PART B: VESSEL MANNING**CHAPTER 3: MANNING REQUIREMENTS FOR CREDENTIALLED OFFICERS**

policies so that a mariner who does not hold a TWIC or holds an expired TWIC, but a current MMC, will not be considered in violation of the applicable regulations. See the Annex for TWIC sample.

Q. Person In Charge Of Medical Care. (2017)

Refer to 46 CFR 12.621 for the requirements to qualify for an STCW endorsement as person in charge of medical care. The STCW is not a manning document; it establishes standards for a mariner's professional qualification. The manning laws and regulations of the United States do not require a vessel to have someone specifically designated as a person responsible to take charge of medical care. If by practice, company policy, or to meet Maritime Labour Convention requirements, someone aboard a seagoing ship is designated to take charge of medical care, that individual must meet the standards of competency set forth in STCW Code, Section A-VI/4-2, and be able to produce evidence of having met those standards (see 46 CFR 15.404(i)). Having a mariner onboard with this certification may eliminate potential port-state control problems which could otherwise result. See NVIC 02-13 for additional information regarding the Maritime Labour Convention.

R. Port Relief Officer (PRO). (2017)

Port Relief Officers, commonly referred to as night mates or engineers and "night hawks," are credentialed officers that are often employed in U.S. ports to supplement regular deep-draft crews in carrying out shipboard functions by keeping in-port watches as outlined in STCW A-VIII/2 Part 5. Although they do not execute articles, PROs are considered to be "on duty" and acting under the authority of a MMC when so employed and are subject to all applicable rules and regulations, including employment and service within the restrictions of a credential (46 CFR 15.401(a)) as well as chemical testing (46 CFR Part 16). Credentials, including medical certificate and TWIC as applicable, must be presented to the Master of the vessel at the time of employment in accordance with 46 CFR 15.401(d). Additionally, PROs must receive shipboard familiarization in accordance with 46 CFR 15.405 and 33 CFR 104.220, as well as 46 CFR 15.1105 and 15.1113 if STCW applicable. A description of duties and responsibilities should also be outlined in the safety management system (ISM Code, Part A/3.2).

S. Staff Officers. (2017)

The statutory provisions for Staff Departments on certain U.S. vessels are in 46 U.S.C. 8302. The manning laws and regulations of the United States do not specifically require a staff officers or the establishment of Staff Department. However, when carried, staff officers must be registered by MMC endorsement as specified in 46 CFR Part 11 (46 CFR 15.835). Staff officers are only required to be registered if they serve on Great Lakes vessels (other than those ferrying passengers and cars) and ocean vessels (see exceptions in 46 U.S.C 8302(a)). Reference Part A Chapter 14 of this Manual for additional information regarding Certificates of Registry for Staff Officers. In accordance with 46 U.S.C. 8302(f), a staff officer may not be included in a vessel's COI. See NVIC 02-13 for additional information regarding the Maritime Labour Convention.

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

A. Introduction. (2014)

Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. Refer to paragraph B1.A for a summary of all Chapters. There are no statutes that mandate specific numbers of ratings on a U.S. merchant vessel. However, the minimum safe manning levels established by the OCMI must appropriately account for the operational requirements of the vessels and the impact of laws, and international treaties, which may imply or indirectly require the assignment of unlicensed seamen to the crew. Refer to Chapter B3 for a more detailed discussion on the impact of international standards, security requirements, and TWIC.

B. Impact Of International Standards. (2014)

Both STCW and SOLAS, in combination, serve to impose particular requirements for unlicensed seamen.

1. STCW Requirements. (2014)

U.S. regulations (46 CFR Parts 10, 11, 12 and 15) parallel the provisions in STCW regarding the qualification and training requirements for watchstanding personnel. Through various amendments, STCW prescribes minimum standards relating to training, certification and watchkeeping for seafarers, which Parties are obliged to meet or exceed (See Chapter B5 for a more detailed discussion of watchkeeping requirements.). Except for certain vessels engaged exclusively in domestic service, STCW certification requirements may apply to deckhands (<100 GRT). For voyages subject to STCW certain provisions will apply based on GT ITC and others regardless of tonnage, in effect triggering certain MMC requirements. See Chapter B3 for voyages to Canada and the impact of ITC.

NOTE: 2010 STCW Amendments, Transitional Provisions.

The 2010 STCW Amendments came into force on 1 January 2012, including the new requirements for minimum rest hours and record of hours of work. In many cases, there is a five-year transitional period, until 1 January 2017, to allow for a phased in implementation of the provisions. However, in some cases (e.g. security endorsements) implementation is sooner. Attention must be paid to these entry into force dates to ensure appropriate compliance. Nevertheless, after 1 January 2017, all mariners serving on vessels subject to STCW must meet the STCW Convention standards, including the 2010 Amendments. The International Maritime Organization (IMO) issued Circulars STCW.7/Circ.16 and STCW.7/Circ.17 which provide clarification of the transitional provisions and advice (for Port State Control Officers) on the transitional arrangements leading up to full implementation of the 2010 Amendments to the STCW Convention and Code on 1 January, 2017. (2014)

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART B: VESSEL MANNING**CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED RATINGS AND NON-CREDENTIALLED CREW**a. Deck Department Personnel. (2014)

- (1) Each person serving as an able seafarer-deck, or a rating forming part of a navigational watch (RFPNW) on a seagoing vessel of 500 GT ITC or more must hold an STCW endorsement certifying him or her as qualified to perform the navigational function at the support level, in accordance with the STCW Convention.
- (2) Each person serving as a RFPNW on a seagoing vessel of 500 GT ITC or more, subject to the STCW Convention, must hold a STCW endorsement attesting to his or her qualifications to perform the navigational function at the support level (II/4).

NOTE: RFPNW may automatically appear as ROANW on the COI, these terms are synonymous. (2014)

- (3) It is feasible that an ordinary seaman, qualified as a RFPNW and duly certificated in accordance with STCW II/4, could substitute for an Able Seaman in certain shipboard situations. Aside from Able Seamen, who hold RFPNW II/4, all other unlicensed seamen in the deck department assigned to navigational watchkeeping duties, including specially trained ordinary seamen, must be certificated in accordance with STCW Regulation II/4. Because 46 U.S.C. 8702(b) requires that only 65 and 50% , respectively, of the deck crew (excluding credentialed officers) be Able Seamen, the remaining 35 and 50% are not required to hold STCW Able Seafarer-Deck II-5). Pursuant to a request from a vessel owner/operator, OCMI's, at their discretion and as appropriate, can issue a Certificate of Inspection (COI) or Safe Manning Document (SMD) endorsed to permit the substitution of ordinary seamen, qualified and certificated in accordance with STCW II/4, for Able Seamen in accordance with 46 U.S.C. 8702(b). In any case, the COI or SMD will not be endorsed to allow fewer Able Seaman than permitted by 46 U.S.C. 8702(b).

Sample Endorsement:

UP TO TWO ORDINARY SEAMEN WITH A STCW CERTIFICATE ENDORSED FOR REGULATION II/4 'RATING FORMING PART OF A NAVIGATION WATCH' MAY BE SUBSTITUTED FOR TWO ABLE SEAMEN WITHOUT FURTHER ENDORSEMENT AS ABLE SEAFARER-DECK II/5.

Title 46 CFR 15.1103(b) states that onboard a seagoing vessel of 500 GT ITC or more, no person may employ or engage any person to serve, and no person may serve, as an able seafarer-deck, except for training, unless the person serving holds an appropriate, valid STCW endorsement (STCW II/5) issued in accordance with 46 CFR Part 12.

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

b. Engine Department Personnel. (2014)

- (1) Each person serving as an able seafarer-engine, or a rating forming part of an engineering watch (RFPEW), on a seagoing vessel driven by main propulsion machinery of 1,000 hp/750 kW propulsion power or more, must hold an STCW endorsement certifying him or her as qualified to perform the marine-engineering function at the support level, in accordance with the STCW Convention.
- (2) Each person serving as a rating forming part of an engineering watch (RFPEW) in a manned engine-room or designated to perform duties in a periodically unmanned engine-room, on a seagoing vessel driven by main propulsion machinery of 1,000 hp/750 kW propulsion power or more, must hold an STCW endorsement certifying him or her as qualified to perform the marine-engineering function at the support level, in accordance with the STCW Convention (III/4).
- (3) Title 46 CFR 15.1103(e) states that, as of January 1, 2017, onboard a seagoing vessel driven by main propulsion machinery of 1,000 HP/750 kW propulsion power or more, no person may employ or engage any person to serve, and no person may serve, as an able seafarer-engine, except for training, unless the person serving holds an appropriate, valid STCW endorsement (STCW III/5) issued in accordance with 46 CFR Part 12.
- (4) Electro-Technical Rating (ETR). Although the Coast Guard has amended the regulations to facilitate the issuance of ETR endorsements in accordance with STCW Regulations III/7, there is no corresponding regulation to require an ETR under the provisions of safe manning. However, should the COI or SMD stipulate a specific carriage requirement, or should a vessel voluntarily carry a ETR, the persons serving in that capacity should be duly endorsed. See MSIB 006-17.
- (5) As provided in 46 CFR 15.105(g), personnel serving on certain small vessels engaged exclusively on domestic, near-coastal voyages are in compliance with 46 CFR Subpart K of Part 15 and are, therefore, not subject to further requirements for the purposes of the STCW Convention [See Chapter B3, Section B.2.d.(1)]. Accordingly, STCW endorsements are not required for engine department ratings engaged on subject vessels, regardless of propulsion power (See NVIC 7-00).

c. Additional Requirements. (2014)

- (1) Basic Training (46 CFR 15.1105). Onboard a seagoing vessel, no person may assign a shipboard duty or responsibility to any person who is serving in a position that must be filled as part of the required crew complement or who is assigned a responsibility on the muster list, and no person may perform any such duty or responsibility, unless the person performing it can produce evidence of having:
 - (a) Received appropriate approved basic training or instruction as set out in the standards of competence under STCW Regulation VI/1, with respect to

PART B: VESSEL MANNING**CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED RATINGS AND NON-CREDENTIALLED CREW**

personal survival techniques, fire prevention and fire-fighting, elementary first aid, and personal safety and social responsibilities; and

- (b) Maintained the standard of competence under STCW Regulation VI/1, with respect to personal survival techniques, fire prevention and fire-fighting, elementary first aid, and personal safety and social responsibilities, every 5 years.
- (2) Lifeboatmen (46 CFR 15.404(e) and (g)). Every person assigned duties as a lifeboatman must hold a credential attesting to such proficiency. Persons serving on vessels subject to the STCW Convention must also hold an STCW endorsement (VI/2) in proficiency in survival craft and rescue boats other than fast rescue boats (PSC) except, or in proficiency in fast rescue boats.
- (3) Tankerman. See 46 CFR 15.860.
- (4) Passenger Vessels On International Voyages. In accordance with 46 CFR 15.1103(f), onboard a passenger ship, as defined by the Convention for the Safety of Life at Sea, 1974, as amended (SOLAS), on an international voyage, any person serving as master, chief mate, mate, chief engineer, engineer officer, or any person holding a license, MMD, or MMC and performing duties relating to safety, cargo handling, or care for passengers, must meet the appropriate requirements of Regulation V/2 of the STCW Convention. These individuals must hold documentary evidence to show they meet these requirements. 46 CFR 11.1105 and 12.095 set out similar requirements.
- (5) Medical Certificates. After 1 January 2017, all persons employed or engaged onboard vessels to which STCW applies must hold a medical certificate valid for 2 years unless the mariner is under the age of 18, in which case the maximum period of validity is 1 year (46 CFR 15.401(c)/15.1103(h)). If a mariner's medical certificate expires during a voyage, it will remain valid until the next United States port of call, provided that the period after expiration does not exceed 90 days (46 CFR 15.1103(h)(3)). See page ANNEX-11 for additional information and transitional provisions.
- (6) Other Crewmembers. Crewmembers not specifically required by STCW to be certificated by the Administration (e.g. Steward's Department), must still comply with Basic Training (46 CFR 15.1105) [see Section B.1.c.(1) of this Chapter], as well as certain security requirements [see Chapter B3]. Initial Basic Training is accomplished ashore through Coast Guard approved courses. After the 2017 implementation, continued compliance with Basic Training may be demonstrated through a combination of onboard training/experience and shore based assessment (see 46 CFR 11.302 and 12.602). A MMC may be endorsed for Basic Training (46 CFR 10.109(d)(13)). This is in addition to a valid MMC (for vessels

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

of 100 GRT or more) with entry level endorsements (i.e. Wiper/Ordinary Seaman (OS)/Stewards Department-Food Handler (FH)[if applicable], medical certificate [see Section B.1.c.(5) of this Chapter], and TWIC (if applicable, see Chapter B3 paragraph P.). See Section B.1 of this Chapter for vessels <100 GRT.

NOTE: All entry level MMC endorsements are annotated as "Domestic Only" as there is no corresponding international endorsement or rating. Absent a specific STCW requirement for certification by the Administration, these entry level MMC endorsements are suitable for service as described in this Section. (2014)

2. SOLAS Requirements. (2014)

SOLAS Chapter V, Regulation 14 requires each vessel to which Chapter I of SOLAS applies to be "sufficiently and efficiently" manned as evidenced by a Safe Manning Document (SMD) issued by the flag-state. Refer to Chapter B3 for a more detailed discussion on the impact of international standards and SMD provisions.

a. Principles Of Safe Manning. (2014)

In establishing the safe manning level to assure a vessel is sufficiently and efficiently manned, SOLAS makes reference to IMO Resolution A.1047(27) that establishes the principles of safe manning and prescribes the form and content of the safe manning document.

b. Resolution A.1047(27). (2014)

Resolution A.1047(27) acknowledges that watchstanders should normally be divided into three watches; and that lookout and helmsman duties are separate. Where an engineering watch is assigned, it recommends that an officer and at least one unlicensed rating be assigned, unless there is a watch monitoring system (e.g., "dead man alarm") installed on the bridge. For additional information on the Principles of Safe Manning, reference Chapter B3, paragraph B.5. Refer to Chapters B2 [Manning and STCW Certification Reference Tables (Seagoing Vessels)], B5, and B7 for additional discussion on vessels permitted to maintain a two-watch system.

C. Statutes Affecting Ratings. (2014)

U.S. statutes affecting ratings are consistent with international requirements. A number of statutory provisions affect working conditions and watchkeeping requirements for ratings. Chapter B5 of this Volume provides more detailed discussion of working provisions.

1. Merchant Mariner Credential/Document Requirement. (2014, 2017)

Under 46 CFR 15.403, every person below the grades of officer and staff officer employed on any U.S. flag merchant vessel of 100 GRT or more, except those navigating rivers exclusively and the smaller inland lakes, must possess a valid merchant mariner credential (MMC) or merchant mariner's document (MMD) with all appropriate endorsements for the positions served. For technical or industrial positions for which the Coast Guard does

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

not require a particular credential, the seaman must possess an MMD endorsed for entry ratings. Certain vessels are exempted from some of the requirements by 46 U.S.C. 8701. Refer to the statute for specific exemption limitations applicable to most fishing industry vessels, barges, yachts, sailing school vessels, oceanographic research vessels, and mobile offshore drilling units (MODU). For additional information on TWIC, see Chapter B3 paragraph P.

NOTE: For the purposes of 46 U.S.C. 8701, the term "smaller inland lakes," as used in 46 CFR 15.403(b)(1), means any inland lake other than the Great Lakes as they are defined in 46 CFR 10.107. (2017)

2. Crew Complement. (2014)

Although there are no statutes that mandate specific numbers of ratings on a U.S. merchant vessel, the minimum safe manning levels established by the OCMI must appropriately account for the operational requirements of the vessels and the impact of laws, and international treaties, which may imply or indirectly require the assignment of unlicensed seamen to the crew. On oceangoing vessels, the number of unlicensed personnel carried must be sufficient for the watch provisions of 46 U.S.C. 8104 and 46 CFR 15.705. 46 U.S.C. 8702 requires at least 75 percent of the crew in each department to be able to understand orders spoken by the officers. Additionally, 65 percent of the unlicensed deck crew must hold MMCs endorsed as able seaman; except vessels authorized to employ a 2-watch system may reduce the percentage to 50 percent.

3. Citizenship Requirements. (2014)

Although a foreign national, e.g., an alien lawfully admitted to the United States for permanent residence, may obtain a MMC, 46 U.S.C. 8103 imposes specific citizenship requirements for U.S. vessels that may significantly limit the number of aliens that may be employed on such vessels. Specifically, Section 8103(b) states that each unlicensed seaman must be a citizen of the United States or an alien lawfully admitted to the United States for permanent residence, and not more than 25 per cent of the total number of unlicensed seamen on the vessel may be permanent resident aliens. (See Chapter B1 for a more detailed discussion of the citizenship requirements.)

4. Seagoing And Great Lakes Merchant Vessels Of More Than 100 GRT. (2014, 2017)

Section 8104(d) provides that the unlicensed sailors and oilers on seagoing and Great Lakes vessels of more than 100 GRT must be divided into at least three watches. Section 8104(g) modifies this requirement in that it allows a 2-watch system to be employed on towing vessels, OSVs, and barges engaged on voyages of less than 600 nautical miles.

NOTE: The Howard Coble Coast Guard and Maritime Transportation Act of 2014, Sec. 316, removed exclusions of various engineering ratings from performing their duties within a two-watch system. The Coast Guard amended 46 CFR 15.705(b) and (c)(1) to harmonize regulations with the statutory changes. These changes came into effect in January 2016. (2017)

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

5. Towing Vessels (UTV or Subchapter M). (2014, 2017)
 46 U.S.C. 8104(h) provides that on a vessel to which Section 8904 applies, an individual licensed (credentialed) to operate a towing vessel may not work more than 12 hours in a consecutive 24-hour period except in an emergency. Sections 8104(a), (c), (d), (e), and (g) establish watchkeeping, work hour, and rest period rules for crews on seagoing and Great Lakes towing vessels. A towing vessel's unlicensed crew is not restricted by any of these laws from voluntarily working beyond 8 hours. Unlicensed seamen on inland towing vessels, other than the Great Lakes, that are on voyages of 600 miles or more, have no specified work hour limit or watch schedule provided by statute. However, if the voyage is less than 600 miles, then 46 U.S.C. 8104(g) applies. Regardless of the route of the vessel, or work rules agreed to by crewmembers individually or through collective bargaining, the owner and master are required to provide an adequate and fit watch as discussed in 46 CFR 15.610 and 15.705. Consequently, if the credentialed officers or ratings have no relief and are too fatigued to stand an alert watch, a hazardous condition is created and the owner and/or master should not permit the vessel to continue to operate until the situation is remedied. (See Chapters B5 and B7 for further discussions.)

6. Fish Processing Vessels And Fish Tender Vessels. (2014)
 46 U.S.C. Sections 8104(k), (l), (m), and (o) provide watchstanding requirements for the licensed individuals (credentialed officers) and deck crew on board these types of commercial fishing vessels.

7. Tankers. (2014)
 Section 8104(n) limits a credentialed individual from working more than 15 hours in any 24-hour period. In effect, Section 8104(n) imposes an average work limit of 12 hours in a 24-hour period for credentialed individuals on tankers. Many tankers employ unlicensed personnel to assist in cargo handling responsibilities. These individuals should be included as part of the required manning on the COI if such crewmembers are required for safe cargo operations or are necessary to meet the work hour limits.

D. Deck Department Manning. (2014)

The deck department for a seagoing vessel of at least 100 GRT typically consists of able seamen and ordinary seamen. Inland vessels typically employ "deckhands" for similar functions.

1. Able Seamen And Ordinary Seamen. (2014, 2017)
 Unless specifically provided otherwise, the deck department on a seagoing vessel would normally consist of six able seamen and three ordinary seamen to meet operational requirements including watchstanding, cargo handling and vessel maintenance. The three ordinary seamen may be eliminated from the required crew if the OCMI is satisfied with the installed crew watch call system, the messing and sanitary facilities provided in proximity to the navigation bridge, as well as the suitability of labor-saving deck equipment and mooring arrangements. Unrestricted ocean voyages continue to require at least six able seamen (or four able seamen and two specially trained ordinary seamen) in

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

the crew complement to assure adequate watchkeeping. For vessels of a limited size, the OCMI may consider a reduction in the total number of able seamen based on the suitability to meet operational requirements, including: watchkeeping arrangements, maintenance, fitness for duty, and emergency duties. Generally, reductions have been considered for the following categories:

Less than 500 GRT or 6,000 GT ITC - 3 ABs

6,000 GT ITC or more, but less than 20,000 GT ITC - 3 ABs and consideration for additional deck maintenance personnel capable of supplementing the navigational watch.

In any case, the OCMI should be satisfied with the arrangements for keeping a navigational watch as set forth in Section A-VIII/2 of the STCW Code, specifically Part 4-1 – Principles to be Observed in Keeping a Navigational Watch.

Reference Section B.1.a.(3) of this Chapter for additional information concerning the substitution of able seamen with specially trained ordinary seamen on voyages subject to STCW. The OCMI may consider allowing specially trained ordinary seamen (OS) meeting the requirements of NVIC 3-83 as substitutes for up to 35 percent of the required ABs on Non-STCW voyages and 50 percent where a 2-watch system is authorized. See the scales in Chapter B2 for certain vessels allowed 2 ABs based on watch system.

a. Scale Of Employment. (2014)

Able seamen are rated as: unlimited, limited, special, offshore supply vessel, sail, and fishing industry, under the provisions of 46 CFR Part 12. Title 46 U.S.C. 7312 specifies the categories of able seamen (i.e., unlimited, limited, etc.) necessary to meet the requirements of 46 U.S.C. 8702.

- (1) Individuals qualified as able seamen—unlimited may constitute all of the able seamen required on a vessel.
- (2) Individuals qualified as able seamen—limited may constitute all of the able seamen required on a vessel of less than 1,600 GRT or on a vessel operating on the Great Lakes and the Saint Lawrence River as far east as Sept Iles. Individuals qualified as able seamen—limited may constitute not more than 50 percent of the number of able seamen required on board other vessels.
- (3) Individuals qualified as able seamen—special may constitute—
 - (a) all of the able seamen required on a vessel of not more than 500 GRT or on a seagoing barge or towing vessel; and
 - (b) not more than 50 percent of the number of able seamen required on board other vessels.

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

- (4) Individuals qualified as able seamen—offshore supply vessel may constitute all of the able seamen required on board a vessel of less than 500 GRT or 6,000 GT ITC engaged in support of exploration, exploitation, or production of offshore mineral or energy resources. Individuals qualified as able seamen—limited may constitute all of the able seamen required on board a vessel of at least 500 GRT or 6,000 GT ITC engaged in support of exploration, exploitation, or production of offshore mineral or energy resources.
- (5) When the service of able seamen—limited or able seamen—special is authorized for only a part of the required number of able seamen on board a vessel, the combined percentage of those individuals so qualified may not be greater than 50 percent of the required number.
- (6) Individuals qualified as able seamen—fishing industry may constitute—
 - (a) all of the able seamen required on a fish processing vessel entered into service before January 1, 1988, and of more than 1,600 GRT but not more than 5,000 GRT; and
 - (b) all of the able seamen required on a fish processing vessel entered into service after December 31, 1987, and having more than 16 individuals on board primarily employed in the preparation of fish or fish products but of not more than 5,000 GRT.

2. Deckhands. (2014, 2017)

The number of deckhands assigned to inspected vessels shall normally be determined on the basis of operational requirements. (See Chapter B2 for a detailed discussion of the factors influencing the number of deckhands on small passenger vessels.) The minimum number of deckhands employed on an uninspected vessel should be based on the operational requirements of the vessel, taking into account any watchstanding requirements for such crewmembers. See B4.B.1. for additional discussion on the impact of international conventions on certain vessels employing deckhands. Under U.S. law, specifically the federal child labor provisions authorized by the Fair Labor Standard Act (FLSA), the general minimum age is 16 years for employment (29 CFR 570.2). The FLSA is specifically applicable to seamen (29 CFR 783.24).

E. Engineering Department Manning.

The engineering complement on a vessel is dependent on a number of factors (e.g., type of propulsion system, number of separate machinery spaces requiring monitoring of equipment, level of machinery automation, and maintenance requirements).

1. Motor Vessels.

Non-automated vessels powered by diesel, gasoline, or gas turbine engines would

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

typically employ three to six oilers as qualified watchstanders depending on the complexity and arrangement of the machinery spaces.

2. Steam Vessels.

Non-automated steam vessels would typically assign at least one fireman/watertender on watch for each machinery space containing a boiler. In addition, an oiler and wiper would typically be assigned to each engine room watch depending on the complexity and arrangement of the machinery spaces.

3. Electric Propulsion.

An OCMI should consider the need for the assignment of a sufficient number of electricians for watchstanding or maintenance as part of the required manning for vessels that employ electric propulsion. This manning requirement should be in addition to the manning required for safe operation of the prime mover for generating electric propulsion power.

4. Automated Machinery. (2014)

Engineering manning levels on an automated vessel will be based on an assessment of the automation system installed as detailed in 46 CFR Part 62 and NVICs 1-69, 7-73, 1-78 as amended, and 6-84. The engineering ratings may be completely eliminated depending on the capability and sophistication of the automation system. (Consult Chapter B6 for detailed information concerning requests for manning reductions and operations on such vessels.)

5. Qualified Member Of The Engine Department (QMED). (2014, 2017)

Under 46 CFR 15.404, the holder of an MMD or MMC endorsed with one or more QMED ratings may serve in any unqualified rating in the engine department without obtaining an additional endorsement. A QMED may serve as a qualified rating in the engine department only in the specific ratings endorsed on his or her MMD or MMC. As noted in the preamble to the STCW Final Rule (78 FR 77871), the minimum number of QMEDs are specified in the COI and those serving in such positions must also hold an STCW endorsement when serving on vessels (1,000 HP/750 kW propulsion power or more) subject to the STCW Convention. This means that if the COI requires three QMED-Oilers, for a vessel (1,000 HP/750 kW propulsion power or more) subject to the STCW Convention, then they should hold an STCW endorsement as rating forming part of an engineering watch (RFPEW) in accordance with STCW III/4. This includes QMED-Oilers designated to perform duties in a periodically unmanned engine-room. QMED-Oiler and Fireman/Watertender are not expressly required by 46 CFR 15.404(d)(3) to hold a STCW endorsement as able seafarer-engine (III/5). Enter QMED-Oiler as Oiler on COI.

6. Other QMED Ratings. (2017)

Generally, the ratings of "junior engineer," "pumpman/machinist," or "electrician/refrigeration engineer" are not required on the COI. Similarly, there is no prescriptive manning requirement for a minimum number of persons qualified as able-seafarer-engine (III/5) to be specified on a COI for a vessel subject to the STCW

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

Convention. Section (d)(3) of 46 CFR 15.404 requires persons serving on vessels (1,000 HP/750 kW propulsion power or more) subject to the STCW Convention as "junior engineer," "pumpman/machinist," or "electrician/refrigeration engineer" to hold an STCW endorsement as able seafarer-engine (STCW III/5). The minimum manning requirements are prescribed by the OCMI in accordance with 46 CFR 15.801. Other QMED ratings may be substituted for one or more QMED-Oilers when permitted by the COI. For example, if the owner, operator, or master of a vessel requests that the vessel's complement include a junior engineer, the COI will carry the requirement for "oilers" and a notation that "junior engineers may be substituted for one or more oilers." See Chapter B4.F for Maintenance-Persons and Maintenance Departments. In such cases, these persons should hold an STCW endorsement as able seafarer-engine (III/5) as well as RFPEW (III/4) as required by 46 CFR 12.607(a)(2) & (3) when serving on vessels (1,000 HP/750 kW propulsion power or more) subject to the STCW Convention.

NOTE: Employment of these ratings as substitutes for oilers does not remove them from the watchstanding provisions of 46 U.S.C. 8104 and 46 CFR 15.705.

F. Maintenance-Persons And Maintenance Departments.

1. Authority Citations.

46 U.S.C. 8101 and 8104, and 46 CFR 15.705.

2. Background. (2014)

OCMI authority for approving requests for changes in the required crew composition is contained in 46 CFR 15.501 and 15.505. This section states that the COI issued to an inspected vessel specifies the minimum complement of licensed/credentialed individuals and crew considered necessary for the safe operation of the vessel. Among the factors to be considered by the OCMI in determining the minimum crew complement are: installed equipment, degree of automation, use of labor saving devices, and the organizational structure of the vessel. The establishment of a maintenance department and maintenance persons and the ability to delegate crewmembers to different areas, may provide the vessel's master the flexibility to use the crew more effectively while still ensuring that sufficient qualified personnel are carried for continued safe operation of a vessel. When permitted by the Certificate of Inspection, some of the individuals in a vessel's required crew complement may be engaged as maintenance-persons and assigned as deck maintenance-persons or engine maintenance-persons in their respective departments. These individuals would perform maintenance duties within the deck or engine department boundaries and are subject to the crossover prohibition of 46 U.S.C. 8104(e). If the vessel establishes an acceptable maintenance department, the mandated maintenance-persons will be assigned to the maintenance department and are then available as a vessel's maintenance crew who are not subject to the crossover prohibition in 46 U.S.C. 8104(e). The required maintenance-persons shall hold appropriate qualified ratings (AB, QMED, etc.) so that they may be used by the vessel's master to augment navigational or machinery space watches should statutory or regulatory requirements come into effect or situation. For those maintenance-persons not assigned to the maintenance department, watch

PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

assignments would be governed by departmental affiliation, except under circumstances noted in 46 U.S.C. 8104(f). For maintenance-persons assigned to the maintenance department, watch augmentation will be based on individual qualifications. For example, an individual who holds both deck and engine qualifying ratings working in the maintenance department may be assigned to deck or engine watches at the discretion of the master. During periods in which these maintenance-persons are used to augment navigational or machinery space watches, they become part of the watch and are subject to requirements of 46 CFR 15.705. Engagement of maintenance-persons with the intention of assigning any individual alternately between deck and engineering watch sections on a routine basis is considered a violation of 46 U.S.C. 8104(e). (Consult Chapter B1 for additional information concerning Maintenance Departments.)

3. Manning Requirements For Vessels Engaged On International Voyages. (2014)
 For vessels subject to STCW, personnel required to augment navigational or machinery space watches should hold the appropriate qualified ratings endorsements as required in 46 CFR 15.1103.

4. Acceptance Of Crew Composition Adjustments.
 If a vessel owner or operator requests the certificating OCMI to make crew composition adjustments to allow flexibility in the assignment of watchstanding personnel with the carriage of maintenance-persons, the OCMI should consider the following factors in determining the acceptability of the proposed adjustments:
 - a. Maintenance Plan.
 Implement an acceptable maintenance plan. The OCMI should review the vessel's plan bearing in mind the proposed crew's ability to perform all duties within reasonable or required work hour limits.

 - b. Maintenance Department.
 Implementation of a maintenance department on board the vessel; as appropriate.

 - c. Vessel's Equipment. (2014)
 Nature and reliability of vessel equipment, labor saving devices, alarm systems, and automated systems, including autopilot steering capability. (See Chapter B6; 46 CFR 15.715; and 46 CFR 62.)

 - d. Vessel's Design.
 Vessel arrangement, including visibility from the pilothouse and steering position; (for permitting one AB bridge watch).

 - e. Call Systems.
 Bridge and engine room call systems and whether they include the quarters of maintenance-persons who may be required to augment watches.

 - f. Station Bill.
 Inclusion of the term maintenance-person on the vessel's station bill and muster lists.

PART B: VESSEL MANNING**CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED RATINGS AND NON-CREDENTIALLED CREW**g. Master's Responsibilities.

Existence of a vessel operations manual or similar company directives that describe in detail the master's responsibilities regarding the establishment of adequate watches and discretion to utilize appropriately qualified personnel when circumstances require watch augmentation; conditions under which the watch(es) will be augmented including emphasis on keeping a proper lookout; and, the principles contained in the following as they relate to duties, responsibilities, and composition of watches: 46 CFR 15.705 and 46 U.S.C. 8104 (Watches), 46 U.S.C. 8702(d) (AB at the helm), SOLAS Chapter V, Regulation 19 (Automatic pilot), 46 CFR 15.850 and Rule 5 of the Navigation Rules (Lookout) and Subchapter P of Title 33, Code of Federal Regulations (Ports and Waterways Safety).

h. Qualifications Of Personnel. (2014)

Qualifications of the maintenance-persons for proper performance of their duties, including watchstanding. Any request for a reduction in the number of crewmembers based either on automation or the installation of labor saving devices should be approved by Commandant (CG-CVC). (Consult Chapter B6 for detailed information concerning procedures on requests for manning reductions.)

5. COI Sample Endorsements.a. Deck And Engine Maintenance-Person Endorsements. (2017)

If the OCMI is satisfied that adjustments can be made in the required crew composition by the inclusion of deck and/or engine maintenance-persons, the following is representative of the entry to be placed on the vessel's COI:

Able Seamen:	3
Deck Maintenance-persons:	3 ^[1]
Engine Maintenance-persons:	3 ^[2]

[1] Deck maintenance-persons must hold Able Seaman endorsements.

[2] Engine maintenance-persons must hold QMED endorsement as junior engineer, deck engine mechanic, oiler or engineman.

THREE OF SIX MAINTENANCE-PERSONNEL SHALL HOLD QUALIFIED MEMBER ENGINE DEPARTMENT RATINGS WITH ENDORSEMENTS AS EITHER JUNIOR ENGINEERS OR OILERS. THE OTHER THREE MAINTENANCE-PERSONNEL SHALL HOLD ABLE SEAMEN ENDORSEMENTS.

b. Maintenance Department Endorsement. (2014)

If the OCMI is satisfied that adjustments can be made in the required crew composition by the inclusion of maintenance-persons who are assigned to an approved maintenance department, the following is representative of the entry to be placed on an automated vessel's COI where the vessel has been found suitable for

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 4: MANNING REQUIREMENTS FOR CREDENTIALLED
RATINGS AND NON-CREDENTIALLED CREW

minimally attended or periodically unattended machinery operation, and equipped with deck labor-saving devices:

Able Seamen:	3
Maintenance-persons:	6 ^[1]
<p>[1] At least three of the required maintenance-persons must hold endorsements as able seamen, except that up to two of these may be qualified as specially trained ordinary seamen in lieu of holding able seaman endorsements. Three maintenance-persons must each hold a QMED endorsement as junior engineer, deck engine mechanic, oiler, or engineman.</p>	

THE ABOVE MANNING IS CONTINGENT UPON THE UTILIZATION OF A MAINTENANCE DEPARTMENT AS INDICATED IN THE VESSEL'S OPERATING MANUAL. ANY SUBSTANTIAL CHANGE IN THE OPERATION OF THIS DEPARTMENT MUST, PRIOR TO IMPLEMENTATION, BE REPORTED TO THE OCMI WHO ISSUED THE VESSEL'S CERTIFICATE OF INSPECTION.

AT LEAST THREE OF THE REQUIRED MAINTENANCE-PERSONS MUST HOLD ENDORSEMENTS AS ABLE SEAMEN, EXCEPT THAT UP TO TWO OF THESE MAY BE QUALIFIED AS SPECIALLY TRAINED ORDINARY SEAMEN IN LIEU OF HOLDING ABLE SEAMAN ENDORSEMENTS. THREE MAINTENANCE-PERSONS MUST EACH HOLD A QMED ENDORSEMENT AS JUNIOR ENGINEER, DECK ENGINE MECHANIC, OILER, OR ENGINEMAN.

The above endorsements would be affixed in addition to any automation endorsement specified by Chapter B6 of this Volume.

G. Cadets, Student Observers & Apprentices. (2017)

(Not on school vessels or training ships.)

See 46 CFR 12.705, 12.707, 12.709 and 12.711 for endorsements issued to cadets, student observers and apprentices respectively. Although persons holding these endorsements can be signed onboard in this capacity and may be considered as seamen, these endorsements do not authorize the holder to replace any of the required crew. Reference 46 CFR Part 310 for the Maritime Administration regulations regarding Merchant Marine Training for cadets and midshipmen.

CHAPTER 5: SHIPBOARD WORKING CONDITIONS

A. Watchstanding Requirements On U.S. Vessels. (2014)

Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. Refer to paragraph B1.A for a summary of all Chapters. This Chapter outlines various watchstanding requirements and shipboard working conditions relevant to U.S. vessels.

1. Authority Citations.

46 U.S.C. 8104 and 8702, 46 CFR 15.1111 and 46 CFR 15.705.

2. Definitions. (2014)

The following definitions are consistent with previous Coast Guard policies or regulations.

- a. *Emergency* is an unforeseen development that imposes an immediate hazard to the safety of the vessel, the passengers, the crew, the cargo, property, or the marine environment, requiring urgent action to remove or mitigate the hazard.
- b. *Overriding operational conditions* are circumstances in which essential shipboard work cannot be delayed due to safety, security or environmental reasons, or could not have reasonably been anticipated at the commencement of the voyage.
- c. *Rest* means a period of time during which the person concerned is off duty, is not performing work, including administrative tasks such as chart corrections or preparation of port entry documents, and is allowed to sleep without being interrupted.
- d. *Travel time* to a vessel is considered to be neutral time as it is normally not considered to be “rest,” “off-duty,” or “work” time, but all relevant circumstances should be considered in evaluating whether a mariner complies with the applicable “rest” required by STCW or “off-duty” requirements specified in 46 U.S.C. §8104(a).
- e. *Watch* is activity related to the direct performance of vessel operations, whether deck or engine, where such operations would routinely be controlled and performed in a schedule and fixed rotation. The performance of maintenance or work necessary to the vessel’s safe operation on a daily basis does not in itself constitute the establishment of a watch. However, the latter does count toward the hours of work that can be required by an employer.
- f. *Work* is any activity that is performed on behalf of a vessel, its crew, its cargo, or the vessel’s owner or operator. This includes, but is not limited to, standing watches, performing maintenance on the vessel or its appliances, unloading cargo, or performing administrative tasks, whether underway or at the dock.

The definitions above for “overriding operational conditions” and “rest” are used in situations where STCW applies.

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**3. Master's Responsibility. (2014)

The master is responsible for ensuring that adequate watches are established for the both at-sea and in-port operations that necessitate watchkeeping personnel, including those whose duties involve designated safety, security and prevention of pollution functions. In exercising this responsibility, the master must take into account applicable statutory and regulatory provisions and international conventions. In addition, the circumstances affecting the safety of the vessel, its crew, its cargo, its passengers, and operational requirements, especially as they relate to pollution prevention must also be considered. In accordance with 46 CFR 15.1109, each master of a vessel that operates beyond the Boundary Line, except those serving on the vessels listed in 15.105(f) or (g), shall ensure observance of the principles concerning watchkeeping set out in STCW Regulation VIII/2 and section A-VIII/2 of the STCW Code. See Section B of this Chapter for discussion on In-Port Watches Of Credentialed Engineers and Section E.1.d of this Chapter for additional discussion on vessels in Lay-up/Shipyard/Drydock (with application beyond STCW).

4. Watchstanding Categories.

A normal watch cycle will include those crewmembers who have functions, duties or responsibilities about vessel operations that are routinely controlled or performed in a scheduled and fixed rotation. Typically, these functions, duties and responsibilities will include the following:

a. Officer In Charge Of A Navigational Watch (Master Or Mate). (2014)

Except on vessels of limited size the provision of qualified deck officers should be such that it is not necessary for the master to keep regular watches. This principle is accepted internationally and is expressed in International Maritime Organization Resolution A.1047(27), "Principles of Safe Manning."

b. Helmsman (Able Seaman Or Specially Trained Ordinary Seaman, RFPNW). (2014)

The required minimum manning level must include sufficient personnel who may be assigned to the navigation watches to steer the vessel. The helmsman should be separate from the look-out, except on small vessels where the helmsman may safely perform both functions. Unless assigned duty as lookout, the helmsman may be assigned to other duties when not required to be physically present at the helm (e.g., when vessel is on auto pilot). On a merchant vessel of 100 GRT or more (with limited exceptions under 46 U.S.C. 8702) an individual with a rating of less than able seaman may not be at the wheel "in ports, harbors, and other waters subject to congested vessel traffic, or under conditions of reduced visibility, adverse weather, or other hazardous circumstances."

c. Look-out (Able Seaman Or Specially Trained Ordinary Seaman, RFPNW). (2014)

It is expected that a dedicated look-out should normally be assigned to each navigational watch to satisfy Rule 5 of the International Regulations for Preventing Collisions at Sea, 1972 and of the Inland Navigation Rules. Rule 5 requires that "Every vessel shall at all times maintain a proper look-out by sight and hearing as

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**

well as by all available means appropriate in the prevailing circumstances and conditions so as to make a full appraisal of the situation and the risk of collision.” Look-out duties may be performed by the helmsman or the officer in charge of the navigational watch under some circumstances, to the extent that Rule 5 will not be violated. Section A-VIII/2 Part 4-1 of the STCW Code indicates the requirements for individuals serving as look-outs.

d. Officer In Charge Of An Engineering Watch (Chief Engineer, Assistant Engineer, Or Designated Duty Engineer). (2014)

Depending on the level of automation, credentialed engineers would either be assigned to direct watchkeeping assignments within the machinery spaces on a rotating basis or, in the most sophisticated vessels, would be assigned monitoring duties without being obliged to maintain a “live watch” in the machinery spaces. Under such circumstances, the automation system performs a significant amount of the watchstanding functions. The required engineers would be assigned overnight duty to respond to alarms that may occur and potentially make intermittent rounds of the machinery spaces. It is noteworthy that IMO Assembly Resolution A.1047(27) also suggests that the chief engineer would not normally be a watchstander.

e. Qualified Member Of The Engine Department (QMED, RFPEW). (2014)

QMEDs (e.g., oiler, watertender, fireman) would be assigned in a manner similar to the licensed engineers. Non-automated vessels would frequently require QMEDs and non-rated members of the engine department assigned to successive watches. However, QMEDs may be assigned to an alternate work schedule (e.g., day-work) when not required for watchstanding duties in the machinery spaces. Where an engineering watch is assigned, IMO resolution A.1047(27) recommends an engineering officer and engine department rating be assigned, unless the engineering watch officer's status can be monitored from the bridge and assistance immediately dispatched.

f. GMDSS Radio Operator/Radio Officer. (2014)

As discussed in 46 CFR 15.817 every person in the required complement of deck officers, including the master, on seagoing vessels equipped with a GMDSS, except those vessels listed in 46 CFR 15.105(f) and (g), must provide evidence of a valid STCW endorsement as GMDSS radio operator. One of the operators must be designated by the vessel's master as assigned to communicate during a distress situation. Vessels voluntarily relying on the at-sea maintenance provision of the GMDSS must have onboard a licensed GMDSS Radio Maintainer. Vessels without GMDSS will still require radio officers as determined by the FCC.

5. Watchkeeping Arrangements. (2014, 2017)

Current U.S. statutes impose specific watchkeeping requirements on U.S. vessels (46 U.S.C. 8104). Specific provisions for vessels navigating under way and requirements for vessels at anchor can be found in 33 CFR 164.11, 164.13, and 164.19; as applicable. Additionally, STCW Regulation VIII/2 and Section A-VIII/2 detail watchkeeping

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

arrangements and principles to be observed. This includes the posting of watch schedules. Subject to specific exceptions, the definition of “merchant vessel” is not limited to a vessel "engaged in trade or commerce" for the purposes of the manning statutes (see 46 U.S.C.A. 8104, 2007, Notes of Decision, Note 5. Merchant Vessels and [UNITED STATES v. BLUE WATER MARINE INDUSTRIES, INC], 661 F.2d 793, 1981).

- a. Seagoing And Great Lakes Merchant Vessels Of More Than 100 GRT. (2014)
 Except for certain fishing industry vessels and yachts, 46 U.S.C. 8104(d) requires merchant vessels of more than 100 GRT, when at sea, to be manned with a three-watch system, and mariners shall be kept on duty successively to perform ordinary work incident to the operation and management of the vessel (See 46 U.S.C. 8104(d) for specific exceptions). This section of the law also states that a mariner cannot be required to work for more than 8 hours in one day. There are certain exceptions to the work-hour limitations relevant to the docking/undocking, conducting emergency drills, actual emergency situations or overriding operational conditions that compromise the safety of the vessel and its passengers and crew in which a mariner can be required to work more than 8 hours in a day (see 46 U.S.C. 8104(f)). Mariners subject to 46 U.S.C. 8104(d) can consent to work in excess of 8 hours in a day, provided there are no violations of the hours of rest provisions. Generally, the three-watch system such as 4-on/8-off provides an optimal approach although non-conformances in the hours of rest can be triggered by periods of additional work if they are not properly planned and managed.

- b. Two-Watch System. (2017)
 On a towing vessel, an offshore supply vessel, or a barge to which 46 U.S.C. 8104(g) applies, which are engaged on a voyage of less than 600 miles, the credentialed officers and crewmembers may be divided, when at sea, into at least two-watches.

While it is beyond the scope of this guidance to generally categorize every aspect of the term “voyage;” historically, a voyage of less than 600 miles has been construed as meaning the entire distance traversed in proceeding from the initial port of destination, stops at intermediate ports while enroute not being considered as breaking the continuity of the voyage (see 54 FR 125-01, 129 [January 4, 1989]). A port does not include an Outer Continental Shelf (OCS) facility as defined in 33 CFR part 140. In examining the particulars of a contemplated voyage, due consideration should be afforded to the applicable elements of the voyage plan, charter agreement, company orders, and surrounding circumstances to include the loading, discharge, and delivery of cargo and/or services.

Additionally, subject to exceptions, 46 U.S.C. 8104(h) permits a master or mate (pilot) operating a towing vessel that is at least 26 feet in length measured from end to end over the deck (excluding sheer) to work not more than 12 hours in a consecutive 24 hour period except in an emergency. The Coast Guard interprets this, in conjunction with other provisions of the law, to permit masters or mates (pilots) serving as operators of towing vessels that are not subject to the provisions of the

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

Officers' Competency Certificates Convention, 1936, to be divided into two watches regardless of the length of the voyage (46 CFR 15.705(d)).

Vessels on voyages subject to STCW, which employ a two-watch system, are subject to and should comply with the rest periods under the revised STCW requirements. Any additional period of work has the potential to result in non-conformances during subsequent work periods. When engaging on subject voyages, vessel crew should be prepared to demonstrate compliance with the revised STCW requirements to Port State Authorities (see paragraph E of this Chapter for additional information on the STCW requirements). See Chapter B7 paragraph B.3 and Figure B7-1 for similar circumstances where a two-watch system may be permitted.

c. Fish Processing Vessels (FPVs). (2014)

Credentialed officers and deck crew on FPVs over 5000 GRT must be divided into at least three watches. At least a 2-watch system is required on FPVs of more than 1,600 GRT and less than 5,000 GRT. (See 46 CFR 15.705(e) and 46 USC 8104(k) and (l)).

d. Fish Tender Vessels In The Aleutian Trade. (2017)

The credentialed officers and crewmembers on a fish tender vessel of not more than 500 GRT (or less than 2,500 GT ITC) engaged in the Aleutian trade must be divided into at least three watches. However, if: (1) the vessel operated in the Aleutian trade before September 8, 1990; or (2) the vessel was purchased to be used in that trade before September 8, 1990, and in fact entered into service in that trade before June 1, 1992, the credentialed officers and crewmembers must be divided into at least two watches. See 46 USC 8104(o).

B. In-Port Watches Of Credentialed Engineers. (2014)

There have been conflicting decisions and interpretations concerning whether credentialed engineers are required to be aboard vessels that are not in a fully operational condition. Under 46 U.S.C. 3302, vessels are not obligated to be manned according to the COI when they are "laid up, dismantled, or out of commission." The only area for which the Coast Guard has published an interpretation in this regard is the Great Lakes, where most vessels are laid up each winter. A vessel in this area undergoes a distinct status cycle:

1. Operating Status.

The vessel is in service.

2. Laying-Up Status.

The vessel has completed service and is being "laid-up" for the winter.

3. Laid-Up Status.

Laying-up of the vessel has been completed. The vessel is inoperable and is essentially laid-up and dismantled and "out of commission" for the winter.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

4. Fitting-Out Status.

The lay-up period has ended and the vessel is being prepared for service.

Vessels in laid-up status are exempted by regulations from Coast Guard inspection; therefore, no manning requirements shall be made for them. Vessels in laying-up or fitting-out status should normally be required to have credentialed engineers aboard in the early stages of work, and at any time when plant operation warrants such a requirement (for example, while the vessel is moored with boilers in operation). It is recognized that, in many instances, laying-up and fitting-out cannot be classified in a clear-cut manner; however, an adequate determination generally can be made under these criteria.

C. Work Hour Limitations.

1. Authority Citations.

46 U.S.C. 8104; 46 CFR 15.1111 and 46 CFR 15.710.

2. "Required" Vs "Permitted" Work Hour Limits. (2014)

The current statutory provisions limit the number of hours a credentialed officer or crewmember may be "required" to work, and in some cases also limit the number of hours the individual may be "permitted" to work. When an individual cannot be "required" to work beyond a certain number of hours, any work in excess of those hours must be voluntary. Such work is not considered to be voluntary if the individual works as a result of direct or indirect coercion. The employee's signature on an employment contract or when working under a labor agreement that clearly obligates him or her to work more than the statutory work hour limit is evidence that such work is performed voluntarily. (It should be noted that the statutory work hour limit e.g., the limit in the number of hours during which work may be required, is not necessarily the point at which "overtime" is calculated under a particular employment contract.)

a. Seaman's Right To Refuse.

Under 46 U.S.C. 8104(d) an individual retains the statutory right to refuse to work beyond the 8-hour statutory work hour limit, except in an emergency or other condition listed in 8104(f). Furthermore, work performed beyond the statutory limit, even when performed voluntarily, may be considered excessive and should not be condoned if the individual's performance will be impaired by fatigue. A continuing pattern of excessive work hours provides good cause for reviewing whether the manning complement as stated on the vessel's COI is sufficient for the safe operation of the vessel.

b. Holiday Work.

A seaman also may not be "required" to perform "unnecessary work" on Sundays or on certain holidays when the vessel is in a safe harbor, though this rule does not prevent the master from assigning work to get the vessel underway on a voyage. See 46 U.S.C. 8104(f).

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**c. Maximum Permitted Work Hours. (2014)

Under 46 U.S.C. 8104(c), 8104(h), and 8104(n), credentialed officers and crewmembers are not permitted to work beyond a certain number of hours. The individual still cannot be "required" to work over a certain number of hours each day, but these provisions also place a limit on the number of hours the individual can be allowed to work voluntarily. Except in strictly limited circumstances (such as a drill or emergency), the individual subject to the limitation is not permitted, and may not be required, to perform any work if it would result in working beyond the maximum work hour limitation. Vessels subject to STCW requirements have additional work hour limitations as found in A-VIII/1 and discussed in Section E of this Chapter.

3. Duty Status.

46 U.S.C. 8104(a) requires a minimum "off duty" (e.g., rest) period for officers assigned to take charge of the navigational watch when leaving or immediately after leaving port. The Coast Guard interprets "off duty" within this statute to mean: A continuous period of time that is available to the seaman for rest, during which no work is assigned. A vessel's officer who serves as night mate while the vessel is in port is considered to be "on duty" whether or not engaged in work during that time. The hours during which the officer is aboard in such capacity would determine the number of hours worked during that day, and the point at which the officer was relieved would establish the beginning of the off duty period. Similarly, a mariner who has worked aboard vessel during the day and stays aboard with the watch section at night, on call in case of fire or an emergency, is considered "on duty" within the meaning of 46 U.S.C. 8104. The statutory prohibition precluding more than 8 hours required work per day is considered to apply to those officers and crew serving in a night relief watch. However, the presumption is that, by accepting such employment, the night watch has voluntarily assumed the additional duty.

4. Exceptions To Work Hour Limitations.

Where statutory provisions impose work hour limitations, circumstances are described under which the limits are not binding. The master may require seamen to work when the crew is needed for "(1) maneuvering, shifting the berth of, mooring, or unmooring, the vessel; (2) performing work necessary for the safety of the vessel, or the vessel's passengers, crew, or cargo; (3) saving life on board another vessel in jeopardy; or (4) performing fire, lifeboat, or other drills in port or at sea." On the other hand, when there are statutory limits on the number of hours a seaman may be "permitted" to work, the circumstances under which those limits may be broken are restricted to responding to emergencies or for drills. While there are no strict definitions for what constitutes an emergency for purposes of exceeding a work hour limitation, the Coast Guard considers the best guideline to be the generally understood meaning of an emergency: An unforeseen development which imposes an immediate hazard to the safety of the vessel, the crew, the cargo, property, the passengers or the marine environment, requiring urgent action to remove or mitigate the hazard

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**5. Work Hour Limits By Class Of Vessel. (2014)

There are several statutes that impose maximum required or permitted work hours within a specific time period (e.g., "day," 24 hour period, etc.). Where the term "day" is used in the context of work hour limits, the Coast Guard continues to accept a long-standing interpretation rendered by the United States Attorney General that the word "day," as used in the predecessor to 46 U.S.C. 8104, is construed to mean a calendar day of 24-hours beginning at midnight. [(39 U.S. Op. Att'y Gen. 112, opinion dated October 5, 1937)]. Where a provision establishes a work hour limit within a consecutive time period, such as a 24-hour consecutive period, there is no specified starting point from which the 24-hour period is measured; except in an emergency or a drill, the prescribed work hour limit may not be exceeded within any given 24 hour consecutive period.

a. Uninspected Passenger Vessels (<100 GRT) [46 U.S.C. 2101(42)(B)]. (2014)

There are no specific statutory or regulatory work hour limits which apply to the credentialed operators on these vessels, although 46 U.S.C. 8104(b) provides that a licensed individual on a seagoing vessel of not more than 100 GRT may not be required to work more than 12 hours in a 24-hour period at sea. The Coast Guard as a matter of policy considers 12 hours to be the practical limit for how long an individual can safely exercise direction and control of the vessel. While there may be individuals who can routinely and safely perform work for periods in excess of 12 consecutive hours, the rigors of watchkeeping increase the likelihood of fatigue beyond such period, and such a practice should be discouraged as imprudent. Depending upon the specific circumstances, an owner who compels a credentialed operator to work, or a credentialed operator who voluntarily works on an uninspected passenger vessel beyond 12 hours may be engaged in negligent operation of the vessel for failing to maintain an adequate watch. (See Chapters B3 and B7 for further discussions.)

b. Tankers. (2014)

A credentialed officer or seaman may not be permitted to work more than 15 hours in any 24-hour period, or more than 36 hours in any 72-hour period, except in an emergency or a drill. In other words, any individual employed on board in any capacity is limited to an average of 12 hours of work maximum per day, but can never exceed 15 hours of work in a 24-hour period. If an individual works more than 12 hours in one day that individual must work less than 12 hours on other days to ensure he or she does not work more than 36 hours in any three day (72-hour) period. The work hour limit applies to the master as well as other individuals employed on board tankers. The master is recognized to have a unique status on board the vessel. The master's duties, and the overall responsibility associated with overseeing the safety of the vessel and its crew, are continuous. However, the master, like any member of the crew, can suffer from fatigue. Although it may be difficult to fully predict or anticipate the master's workload, the master must regulate his or her own duties and work hours to mitigate the possibility of fatigue, particularly if the master is included in a watch section as an officer of the navigational watch. 46 U.S.C.

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**

8104(n) exempts the master as it does the other credentialed officers and seaman, when work hours must be exceeded in the case of an emergency or drill.

c. Seagoing And Great Lakes Merchant Vessels Of More Than 100 GRT. (2014)

A credentialed officer or seaman in the deck or engine department on these vessels may not be required to work more than 8 hours in one day, except when needed for vessel maneuvers, "necessary" (e.g., essential, safety related) work, lifesaving, or drills. See 46 U.S.C. 8104(d), (e) and (f). This does not preclude seamen from voluntarily working beyond 8 hours and possibly becoming fatigued. OCMI's should consider all relevant information as described in Chapter B1 in establishing the required manning level. While there is no definitive basis for a maximum work hour limit for vessel crewmembers, the OCMI has the discretion to impose manning levels based on a specified reasonable work hour limit taking into account fatigue and other human factors. A twelve hour work day, applied in a manner similar to the work hour limit for tankers, is considered a reasonable work hour limit for other classes of vessels. (See Section K of Chapter B1 for additional discussion.)

d. Commercial Fishing Vessels. (2014)

Although there are no statutory work hour limit provisions regarding these vessels, there are requirements concerning watchkeeping arrangements that apply to the credentialed officers and deck crew on the various uninspected fishing industry vessels. (See Section A.5 of this Chapter and Chapter B7.)

D. Crossover Prohibition.

1. Authority Citation.

46 U.S.C. 8104(e).

2. Deck And Engine Departments. (2014)

On merchant vessels of more than 100 GRT (with certain exceptions as stated in 46 U.S.C. 8104(d), and towing vessels operating on the Great Lakes and connecting waters, a seaman may not be engaged to work alternately in the deck and engine departments; nor may a seaman be required to work in the engine department if he or she has been engaged to work in the deck department, and vice versa. However, this rule does not prevent the seaman from being required to work in a department for which he or she was not engaged when needed for vessel maneuvers, "necessary" (e.g., essential, safety related) work, lifesaving, or drills. See 46 U.S.C. 8104(e) and (f).

- a. When permitted by the Certificate of Inspection, some of the individuals in a vessel's required crew complement may be engaged as maintenance-persons and assigned as deck maintenance-persons or engine maintenance-persons in those respective departments. These individuals perform maintenance duties within the deck or engine department boundaries and are subject to the crossover prohibition of 46 U.S.C. 8104(e).

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**

- b. The required maintenance-persons should hold appropriate qualified ratings (e.g., Able Seaman, QMED, etc.) so they may be used to augment navigational or engine room watches should the need arise. During periods in which these maintenance-persons are used to augment watches, they become part of the watch and are subject to the appropriate watch rotation requirements.

3. Maintenance Department. (2014)

With the increased use of automated systems, labor saving devices, and scheduled shoreside maintenance programs, some vessel operators have used shipboard management innovations to provide greater flexibility in the use of available crewmembers. Assignment of maintenance-persons to a Maintenance Department allows these crewmembers to be used to perform work throughout the vessel on a regular schedule. However, with suitable qualifications, they can also be available to augment the watch as watchstanders as circumstances may warrant (such as periods of restricted visibility, or a failure in an automated system). When authorizing implementation of a Maintenance Department on a particular vessel, the OCMI should condition final approval on review of the vessel's operational requirements, and crew workload, following a trial period of up to a year. (See Chapters B1 and B4 for maintenance department discussion and sample manning scales for vessels employing maintenance-persons.)

E. International Standards Relating To Working Conditions.

1. International Convention On Standards Of Training, Certification And Watchstanding For Seafarers (STCW) 1978, as amended (46 CFR Part 15 Subpart K). (2014, 2017)

The 2010 amendments to the STCW Convention include changes to the hours of rest requirements, 46 CFR 15.1111 and STCW Regulation VIII/1, applicable to personnel working on board U.S. vessels subject to STCW. Specifically, the amended rest hour requirements are as follows: (1) Expanded the application for hours of work and rest periods for mariners to include all personnel with designated safety, prevention of pollution, and security duties onboard any vessel; (2) changed the weekly rest hours requirements from 70 hours to 77 hours; and (3) required the recording of hours of rest. While STCW is not a manning convention, it clearly impacts manning decisions in terms of requiring certain skills to be possessed by crewmembers performing certain functions. STCW also lists a number of criteria to be taken into account and principals to be observed in keeping a watch. Responsibilities of companies are outlined in 46 CFR 15.405, 15.1107, 15.1109 and STCW Regulations I/14 and VIII/2. The Coast Guard published Guidelines on company roles and responsibilities in support of the STCW in NVIC 4-97. NVIC 4-97 continues to serve as guidance and supplements existing regulations and the STCW Convention and Code.

a. Work Hours And Rest Periods. (2014, 2017)

In accordance with the provisions of 46 CFR 15.1111 and section A-VIII/1 of the STCW Code, all persons who are assigned duty as officer in charge of a watch or as a

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

rating forming part of a watch and those whose duties involve designated safety, prevention of pollution and security duties shall be provided with a rest period of not less than:

- (1) a minimum of 10 hours of rest in any 24-hour period; and
- (2) 77 hours in any 7-day period.

This includes, for example, the Master and non-watchstanding engineering personnel in an unattended machinery space. The hours of rest may be divided into no more than two periods, one of which shall be at least 6 hours in length, and the intervals between consecutive periods of rest shall not exceed 14 hours.

b. Exceptions For Emergencies. (2014)

The requirements for rest periods need not be maintained in the case of an emergency or in other overriding operational conditions. Musters, fire-fighting and lifeboat drills, and drills prescribed by national laws and regulations and by international instruments, shall be conducted in a manner that minimizes the disturbance of rest periods and does not induce fatigue. Nothing in this guidance should be deemed to impair the right of the master of a vessel to require a seafarer to perform any hours of work necessary for the immediate safety of the vessel, persons on board or cargo, or for the purpose of giving assistance to other vessels or persons in distress at sea. Accordingly, the master may suspend the schedule of hours of rest and require a seafarer to perform any hours of work necessary until the normal situation has been restored. As soon as practicable after the normal situation has been restored, the master shall ensure that any seafarers who have performed work in a scheduled rest period are provided with an adequate period of rest.

c. Records. (2014)

The master or authorized person is responsible for ensuring that records of daily hours of rest are maintained for each seafarer serving on the vessel. Owners/operators are encouraged to utilize the Model Format for Records of Hours of Work or Hours of Rest of Seafarers developed by the IMO. Each record should be endorsed by the master or authorized person and the seafarer. A copy should be made available to the seafarer. It is recommended that records be retained on-board for each seafarer during their full time on board or for 12 months, whichever is the longer. In an emergency or when unforeseen events occur, changes may be unavoidable. In these cases records should reflect all deviations from the hours of rest schedule.

d. Lay-up/Shipyard/Drydock. (2014, 2017)

The U.S. Coast Guard interprets the provisions of 46 CFR 15.1111 and STCW Chapter VIII (Watchkeeping) as applying to seagoing vessels whose at-sea and in-port operations necessitate watchkeeping personnel, including those whose duties involve designated safety, security and prevention of pollution functions.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

Accordingly, it is the interpretation of the United States that the provisions of STCW Chapter VIII (Watchkeeping), do not apply to U.S. Documented vessels while out-of-service (e.g. laid up, dismantled, or out of commission) in lay berth, shipyard or drydock, unless expressly provided otherwise.

NOTE: This may also include certain public vessels under interagency agreement.

However, owner/operators should be cognizant of other Federal or State laws that may be applicable to vessels while in U.S. shipyards or drydocks. It remains the responsibility of the owner/operator, master and crew to ensure that watches are so arranged that the efficiency of all watchkeeping personnel is not impaired by fatigue and that duties are so organized that the first watch at the commencement of a voyage and subsequent relieving watches are sufficiently rested and otherwise fit for duty. Reference MSM Volume II Section A.6.E and Part B Section 5.B of this Volume for additional information on exemptions for laid up, dismantled, or out-of-commission vessels.

In general, vessels in a recognized reduced operating status (ROS) would be considered in a manner similar to the provisions of this paragraph. Vessels entering into ROS should coordinate with the cognizant OCMI. All applicable regulations and requirements would be relevant upon re-entering service. The OCMI should consult any MOU or MOA in force between the USCG and MARAD or MSC (as applicable).

2. The International Labor Organization (ILO) Convention Concerning Minimum Standards In Merchant Vessels (ILO Convention 147).
 Among other matters, this Convention addresses shipboard conditions of employment and shipboard living arrangements. Each country that is a party to the Convention must have laws or regulations laying down, for vessels registered in its territory, inter alia, "safety standards, including standards of competency, hours of work and manning, so as to ensure the safety of life on board vessel." This convention came into force for the United States on June 15, 1988. (See COMDTINST 16711.12 for enforcement guidance concerning this convention.)
3. Human Factors Considerations. (2014)
 Recognizing that the majority of maritime casualties involve human error, the International Maritime Organization is undertaking a review of its instruments, including conventions, codes and resolutions, to consider whether human factor implications have adequately been taken into account in the development of guidelines, standards and recommendations. The United States is playing a major role in this effort to integrate human factors considerations into the IMO decision-making process. The objective is to ensure that human performance limitations, and the role of the human being within a defined system, are given fundamental consideration in the development of new international standards. Given the rapidity with which new information is becoming available on human factors applications in the maritime environment, it is not possible to

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

provide detailed guidance in this manual. Information which may be particularly useful to the industry will be circulated by other suitable means.

4. Maritime Labour Convention (MLC), 2006. (2017)
See NVIC 02-13 - Guidance Implementing the Maritime Labour Convention, 2006.

F. General Responsibilities. (2014)

Mariners, owners/operators, and the Coast Guard have separate responsibilities for compliance with, and enforcement of, the work-hour limitation and watchkeeping laws. The subparagraphs below provide general guidance regarding the responsibilities of each party. See Annex for the Master's Field Guide to U.S. Vessel Manning.

1. Mariners. (2014)

Mariners have an individual responsibility to obey the law and are responsible for reporting suspected watchkeeping and work-hour violations via the chain of command, ultimately to the Coast Guard once all other efforts have been exhausted. The master of a vessel is ultimately responsible for the safety of the vessel, passengers and crew, cargo, and the environment. To carry out this responsibility the master must ensure that he/she and the crew are properly rested and complying with the law. The master must communicate with the owner/operator to ensure realistic goals are set. If management exerts pressure to exceed the law, the mariner is encouraged to report this situation to the local Coast Guard OCMI. Section G of this Chapter describes protections afforded to mariners when reporting violations to the OCMI. While the definition of work includes activities which are required for the vessel to be operated safely, a minimal amount of *de minimis* activities would generally not be considered a violation of this rule. Examples of such *de minimis* activities include: those which are necessary to ensure continued safe operation of the vessel (i.e. information exchange at watch change); safety meetings; and drills and training which can only be conducted underway.

2. Ship Management. (2014, 2017)

Owners/operators, like mariners, are responsible for obeying the law. Companies should ensure that employees are informed of the law and provided with information regarding safety concerns of not getting adequate rest. They should be aware of operational demands and work hours required to complete expected tasks on board their vessels. 46 U.S.C. 8104(j) states that "the owner, charterer, or managing operator of a vessel on which a violation of subsection (c), (d), (e), or (h) of this section is liable to the government for a civil penalty..." thus pointing out their responsibility to ensure compliance. They should provide unambiguous guidelines to the master regarding expectations to comply with safety requirements and the law when these are in conflict with operational demands. Under the requirements of the International Safety Management (ISM) Code, as amended by IMO Resolution MSC.353(92), for subject vessels, the Company should ensure that each vessel is manned with qualified, certificated and medically fit seafarers in accordance with national and international requirements. Additionally, the company should ensure that each ship is appropriately manned in order

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**

to encompass all aspects of maintaining safe operations on board (reference IMO Assembly Resolution A.1047(27)) (see Chapter B1). Shore management has a responsibility to ensure that the Safety Management System (SMS) provides proper guidance on the management of fatigue, its impact on safety and the regulation of hours of work and rest. The SMS should encourage seafarers to alert their onboard managers should they be working, or be at risk of working, in non-conformance. The SMS should also provide clear guidance to Masters on the actions to be taken in the event of significant non-conformance. Such action may include the suspension of operations until personnel are suitably rested. Owners/operators should also be aware of, and react to, planned or expected periods of high intensity operations and ensure that staffing on board is adequate in good time prior to the planned operations.

NOTE: The company should verify compliance with clause A/6.2 of the ISM Code when carrying out the annual internal audit prescribed by clause A/12.1. This includes provisions for safe manning, watchkeeping, hours of work/rest, training & certification, shipboard familiarization, and medically fit mariners. See 46 CFR Subchapter M, Part 138 for applicable Towing Safety Management Systems (TSMS) requirements. (2017)

3. U.S. Coast Guard. (2014)

The Coast Guard is charged with enforcement of the law. The Coast Guard can initiate an investigation based on confidential information provided by mariners during the vessel inspection process, anonymous tips, or through the findings of a Coast Guard marine casualty investigation. The latter may also bring consequences for the mariners involved or the vessel's owner/operators. When the Coast Guard determines that a casualty occurred because of a violation of law, an appropriate action, a suspension and revocation proceeding, and/or a civil penalty may be recommended. However, as described in Section G of this Chapter, protections exist for the mariner reporting deficiencies or illegal operations. OCMI's should ensure that all responsible parties within their area of responsibility are aware of the requirements of the law and particularly the importance that hours of rest, safe manning, and watchkeeping play in ensuring safe operations. See Section B1.K.3 for additional guidance on inspection and enforcement protocols, as well as Sections B6.A.4 and 5 for automated systems. It should be noted that the Coast Guard, by 46 CFR 5.71, is prohibited from exercising its authority for the purposes of favoring any party to a maritime labor controversy. However, if a situation is encountered that affects the safety of a vessel or persons on board, the Coast Guard will initiate an investigation and pursue appropriate action when a violation of statute or regulation is discovered. A particular situation that has generated confusion and concern involves the requirement found in 46 U.S.C.8104(a), which states that an officer taking charge of the deck watch on a vessel leaving port must have at least 6 hours of off-duty time in the 12 hours immediately before leaving port. While an owner/operator cannot be held accountable for the time a mariner has off, they are responsible for the time that an individual is on the dock or on the vessel while in port, and can be expected to verify that the individual has had an opportunity for rest regardless of where he/she has been prior to performing the assigned duties. The owner/operator cannot expect a mariner to participate in extensive preparations for getting underway and also be rested enough to

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 5: SHIPBOARD WORKING CONDITIONS

take the navigation watch without providing an opportunity for the minimum off-duty time required by 46 U.S.C. 8104(a). Similarly, the mariner is responsible for arriving at the vessel properly rested.

G. Protections. (2014)

The Coast Guard has historically depended on individuals involved with the maritime industry to report violations or unsafe vessel conditions when they occur. In the absence of mariner reporting, the Coast Guard is limited to discovering these types of violations through casualty investigations, or by chance during a scheduled inspection. To prevent retaliation for reporting violations to the Coast Guard, Congress enacted specific protections for mariners that make reports of violations to the Coast Guard. The following cites represent the obligation and protections afforded to mariners for reporting violation of the law or regulations to the Coast Guard.

1. 46 U.S.C. 2114. (2014, 2017)

Provides protection to seamen against any form of discrimination, including discharge, for reporting a violation of any law or regulation issued under the authority of Title 46. Reference 29 CFR Part 1986 for the Seaman's Protection Act (SPA) procedures and interpretations administered by OSHA (see 81 FR 63396).

2. 46 U.S.C. 3315(a). (2014)

Requires credentialed officers servicing on inspected vessels to assist the coast Guard in the inspection of their vessels as well as point out defects and imperfections known to them. This includes any violations of work or watch standing limitations.

3. 46 U.S.C. 3315(b). (2014)

Prohibits any official of the Coast Guard from disclosing the identity of any individual that provides information on vessel defects, imperfections, and overall safety of an inspected vessel which he or she is serving. This includes information on watchkeeping and work hours.

4. Freedom Of Information Act (FOIA). (2014)

The identity of any mariner who reports an unsafe condition on any vessel, inspected or uninspected, is also protected in accordance with the FOIA exemptions and Department of Transportation (DOT) regulations (49 CFR Part 7).

H. Crew Endurance Management. (2014, 2017)

The Crew Endurance Management System (CEMS) provides a system of proven practices for managing endurance risk factors that affect operational safety and crewmember efficiency in the maritime industry. The process of implementing CEMS is intended to be flexible enough to enable a vessel or company to easily incorporate these practices into their current onboard operations. Fundamentally, the system is a continuous-improvement process, which allows an organization to focus efforts towards those factors that are most feasibly mitigated and that

PART B: VESSEL MANNING**CHAPTER 5: SHIPBOARD WORKING CONDITIONS**

present the greatest possible reduction of risk. NVIC 02-08 provides guidelines and standard criteria for use by vessel owners, operators, third-party auditors, Coast Guard OCMI's, marine casualty investigators, and others to aid in the assessment of the veracity and effectiveness of a company's or vessel's CEMS program.

CEMS is not a substitute for applicable legal requirements, nor is it itself currently a regulation. It is not intended to replace guidelines currently in the Oil Pollution Act of 1990 (OPA 90) or Standards of Training, Certification and Watchkeeping for Seafarers (STCW) regarding hours of work and rest. The fundamental purpose of the CEMS is to provide managers, captains, department heads, and officers with tools to manage normal operational risk factors that can degrade crew performance and compromise shipboard safety. Accordingly, it should be used in conjunction with the guidelines provided in OPA 90 and STCW.

See also IMO MSC/Circ.1014, Guidance on Fatigue Mitigation and Management.

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS****A. Manning Requirements. (2014)**

Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. Refer to paragraph B1.A for a summary of all Chapters. This Chapter discusses the acceptance of automated systems to replace specific personnel or to reduce overall crew requirements. Title 46 CFR Part 62 and this Chapter (B6) are not necessarily applicable to uninspected vessels. However, they may be used as an alternative in cases where safe manning documentation is desired. Alternatively, for uninspected towing vessels to receive safe manning documentation endorsed for Periodically Unattended Machinery Space (PUMS), operators may present the OCMI with a Certificate of Class appropriately endorsed for unattended machinery status or meet NVIC 1-78 (see Chapter B3, Section B.2.d.(2)(e)3).

1. General. (2014)

Coast Guard acceptance of automated systems to replace specific personnel or to reduce overall crew requirements is predicated upon the capabilities of the system, its demonstrated and continuing reliability, and a planned maintenance program that ensures continued safe operation. Accordingly, 46 CFR Part 62 applies where automated systems are provided to replace specific personnel in the direct control and observation of the engineering plant and spaces or to reduce overall crew requirements. Often, Part 62 is incorrectly presumed to apply only to machinery or electrical installations that reduce vessel manning requirements; it applies to all automatically or remotely monitored or controlled systems or equipment (MSM Volume IV, Chapter 3.F). The automated systems and arrangements must provide that under all sailing conditions, including maneuvering, a level of safety at least equal to that of the same vessel with the entire plant under fully attended direct manual supervision. The Officer in Charge, Marine Inspection (OCMI) should review all manning proposals objectively. Reductions in manning scales shall only be granted when they do not detract from the safe navigation or operation of the vessel and are consistent with statutory or regulatory requirements. The following general features shall be addressed in reduced manning proposals:

a. Fire Equipment.

Installed fire protection equipment shall be adequate for the reduced complement to deal effectively with a fire emergency.

b. Station Bill.

The station bill shall provide for the effective use of personnel during emergency situations.

c. Lifesaving Equipment.

The design and installation of lifesaving equipment shall be adequate for effective operation by the complement.

d. Vital Systems.

Redundancy of vital systems or machinery shall be required (as in duplicate fuel pumps, secondary vessel's service generator(s) with independent prime movers, etc.).

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**e. Operational Limit.

Scenarios of the vessel's contemplated operation (unlimited or limited service, possible support by shoreside personnel) shall be provided.

f. Accommodations.

Quarters shall be sufficient to accommodate the designated complement and any additional personnel needed during initial operation or during periods when additional manning is required, such as a result of an automation failure. These accommodations need not be in the form of additional staterooms, but their size and furnishings shall be adequate to meet the needs of the additional personnel.

Manning proposals for new construction or existing vessels that are altered to incorporate automated features should be requested from the owner/operator early in the work.

Experience has shown an occasional lack of awareness or understanding of the legal requirements concerning the Coast Guard's assignment of manning scales. In some cases, delay in obtaining such information may result in completion of the vessel to designed standards that will not physically accommodate the required crew.

2. Deck Department.

Reductions in the deck department normally involve elimination of the ordinary seamen, resulting in a deck crew of 6 able seamen (ABs). In addition, requests are received to man vessel's with 4 ABs and 2 ordinary seamen. This manning will normally be considered only if the 2 ordinary seamen meet the criteria set forth in Navigation and Vessel Inspection Circular (NVIC) 3-83. The vessel's Certificate of Inspection (COI) will require 6 ABs, but will be endorsed to allow substitution of up to 2 specially trained ordinary seamen for 2 ABs. The decision to allow substitution of specially trained ordinary seaman for ABs rests with the OCMI. On vessels subject to STCW, members of the navigation watch must meet the qualification as "rating forming part of a navigational watch," and must hold the appropriate STCW certificate. The basic features permitting a lesser requirement for deck personnel are as follows:

a. Messing.

Coffee service, drinking water, and sanitary facilities in the immediate bridge area are necessary for the functioning of the bridge watch without the relief service traditionally provided by an ordinary seaman.

b. Call System(s) From The Bridge.

These systems, running to each mate and AB's quarters, general spaces, such as the messroom and recreation areas, and line-handling stations, enable the summoning of crewmembers for the oncoming watch and in emergencies, and allow better coordination in the mooring/unmooring of the vessel.

c. Constant Tension (Self-Adjusting) Mooring Winches.

These devices enable the reduced deck force to moor/unmoor the vessel safely, without unreasonable physical effort.

d. Automated Hatch Cover Securing Equipment.

These devices enable the reduced deck force to open and secure the vessel's hatches without unreasonable physical effort (this is particularly important aboard dry bulk and container cargo vessels).

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

NOTE: These features are not all-inclusive. Consideration will be given to alternate proposals that accomplish the same goals more practically, when applied to a particular vessel.

3. Engine Department. (2014, 2017)

Modern vessels frequently have automated engineering systems. As defined in 46 CFR 62.10, “automated” means the use of automatic or remote control, instrumentation, or alarms. In certain cases, automated engineering systems may be provided to replace specific personnel in the control and observation of the engineering plant and spaces, or reduce overall crew requirements. See 46 CFR Subchapter L, Part 130 Subpart D for specific provisions pertaining to the automation of unattended machinery spaces on offshore supply vessels of 100 GRT but less than 6,000 GT ITC (500 GRT is not GT ITC assigned). A review of automated vessel experiences show varying degrees of reliability in engineering automation. Accordingly, the U.S. Coast Guard’s acceptance of automated engineering systems to replace specific personnel or to reduce overall crew requirements shall be made only after a system has been operated for a sufficient period of time to demonstrate its reliability.

a. Machinery Space Attendance And Reduced Manning. (2014, 2017)

The Officer in Charge, Marine Inspection (OCMI) shall review and approve all requests for reductions in engine room manning, including requests to operate minimally attended or periodically unattended machinery spaces (MAMS/PUMS). The examination shall include a detailed analysis of the following: (1) the capabilities of the automated system; (2) the combination of the personnel, equipment, and systems necessary to ensure the safety of the vessel, personnel and environment in all sailing conditions; (3) the ability of the crew to perform all evolutions including emergencies and during control or monitoring system failure; (4) a planned maintenance program with regular testing and inspection procedures; and (5) the automated system's demonstrated reliability during its initial trial period and its continued reliability. Critical consideration shall be given to the degree of vital system automation, status of automation approval by the Marine Safety Center (MSC) and status of testing required by 46 CFR 61.40. 46 CFR 62.50 provides additional details on the specific equipment and operational requirements for minimally attended or periodically unattended machinery arrangements. Although classification society automation notations identify the level of automation provided in accordance with class rules, they are not a substitute for the applicable laws, regulations, and policy pertaining to manning and watchkeeping on U.S. vessels. The OCMI shall consider all relevant information in determining a reduction in crew size or authorization for MAMS/PUMS to ensure there is no adverse affect on safety. Any follow-up requests for alteration of the vessel's manning shall be documented and reviewed in a similar manner. See also 53 FR 81-030, 96 [May 18, 1988]), specifically 17834 for OCMI authority and responsibility.

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

NOTE: Under the provisions of 46 CFR 50.05-1, Parts 61 and 62 apply to installations contracted for after August 16, 1988 and were not retroactive to existing installations. The guidelines in NVIC 1-69 and 6-84 apply to installations contracted before the Vital System Automation rulemaking. (2017)

b. Automated Engineering Systems. (2014)

There are generally four stages in the approval process of vessels with automated vital systems that may ultimately lead to a request for a reduction in engine room manning. This process occurs between the vessel owner and the cognizant OCMI.

(1) Conceptual Approval.

This is normally given in response to a request to evaluate a proposed vessel and its crew size before construction and, in some instances, may be based on only the broadest description of the vessel and its intended operations. Conceptual approval is always based on the condition that the cognizant OCMI finds the vessel's proposed manning is sufficient for safe operation. The manning levels in the conceptual approval are the design goals for the owner, which are subject to change if the situation warrants. Also, the owner may want to design the automation so that the engine room is suitable for periodically unattended operation, even though no request for reduced manning is made during initial certification.

(2) Technical Review and System Testing. (2014)

In accordance with 46 CFR 61.40, design verification and periodic safety testing of automated vital systems verifies system design, construction and operation according to applicable Part 62 requirements. These include general and specific requirements for the types of vessels described in 46 CFR 62.01-5(a) and the automated engineering systems described in 62.01-5(b). There are additional requirements when automation is intended to replace watchstanders for minimally attended or periodically unattended machinery spaces (see 46 CFR 62.50-20 and 62.50-30, respectively). Design verification testing proves the fail-safe character of the vital systems automation design, and is the most effective method to verify functional independence of automated engineering systems. This testing must be performed according to a design verification test procedure, considered satisfactory for shipboard testing by the MSC, and witnessed by the cognizant OCMI or, in the case of NVIC 2-95 (series), a designated Authorized Classification Society Surveyor before vessel certification or immediately after installation of the automation, as applicable. The approved design verification test (DVT) procedure is the final product of the completed vital systems automation plan approval and satisfactory review of the qualitative failure analysis (QFA) required by 46 CFR 62.20-3(b). A staff engineer from MSC may accompany the OCMI to witness the DVT. This critical testing should not be started until plan review of the QFA and DVT is complete. Periodic safety testing must also be completed to demonstrate required instrumentation and

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

alarms and proper operation of the automation. This testing is done in accordance with the periodic safety test procedure that is reviewed by MSC and then forwarded with recommendations to the cognizant OCMI. Again, this testing should not begin until vital systems automation plan review is complete. The MSC or ACS (in the case of ACP) conducting plan review on behalf of the Coast Guard will not stamp such plans "Approved" until after the completion of testing and after the incorporation of any necessary changes identified during testing by the OCMI or ACS. Following successful completion of testing onboard and the incorporation of any necessary changes identified during testing, the document must be resubmitted to MSC for final review and approval.

(3) Initial Certification. (2014, 2017)

When a vessel is initially certificated, the manning level specified in the manning block on the certificate of inspection will generally be that of a fully manned engine room. This level is determined based upon the minimum personnel necessary to stand the engine room watch should complete automation failure occur. However, contingent upon satisfactory technical review and system testing, during the trial period the vessel's master has the authority to decide if watches are necessary, the required complement of the watch, and how watches are actually stood (46 CFR 15.715(b)). In making this determination the master should pay due regard to IMO Resolution A.1047(27), as discussed in paragraph (4)(g) below, when on an international voyage. If for some reason the automation fails, the necessary watchstanders will be onboard and will be assigned a watch schedule in accordance with the requirements of 46 U.S.C. 8104. No reference to watches or periodic unattended engine room operation is to appear on the COI until approved. However, the COI should indicate the MSC automation system approval letter by serial number and date.

(4) Final Approval. (2014)

A vessel owner may ask the cognizant OCMI for a reduction in engine room manning before, at, or sometime after, initial certification. The request for reduction in engine room manning must precede the trial period discussed below and must be consistent with the technical approval of the vessel's automation features. In making a final approval determination the OCMI should: (1) ensure satisfactory completion of the trial period; (2) review the vessel's records; and (3) conduct an onboard observation trip to witness the system's reliability and the ability of the reduced crew to maintain and perform all evolutions safely. Based on a satisfactory approval;

(a) Trial Periods. (2014)

The trial period is a period of operating the plant at the desired watchstanding level (however, a complete engineering crew, as specified in the manning block on the vessel's COI, must be onboard). The trial period validates the proper design and installation of the automation intended to

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

replace engine room personnel and allows the vessel personnel to correct minor system problems and fine tune the automated systems. The trial period also demonstrates the reliability of the automation hardware and software. The duration of trial periods for new construction when the vessel is first in a class of vessels is based on underway time and will be 3000 hours. Follow up vessels in the same class may have a reduced trial period depending upon the successful completion of the trial period by the first in class and other circumstances considered by the OCMI. Similarly, consideration for reduced trial periods may also be given to vessels routinely engaged on limited routes with regular access to shore-based maintenance support. On the other hand, evidence of repeated major problems and systems failures may be cause for the OCMI to lengthen trial periods and in some cases reevaluate previously accepted manning levels on vessels of the same class.

(b) Review of Vessel Records.

Whenever possible, the inspector should review the engineering logs, maintenance records and crew overtime logs prior to the observation trip. This will assist in developing a plan for conducting the inspection and to identify possible problem areas with the automation. The OCMI should prompt the vessel owner to submit these logs for review whenever they are not attached with the observation trip request. Identification of problems can be a formidable task. Many of the sophisticated computer logging systems prevalent today tend to log all events. For example, equipment secured by the vessel's crew as a matter of routine generate alarms and logged events. It is difficult to differentiate such normal occurrences from evidence of significant automation problems (e.g., repeated problems that significantly degrade system reliability or automation system/equipment failures). Interviews with the engineering crew should help the inspector make these distinctions. It is also important to determine whether maintenance is preventive or in response to a casualty. Interviews will also assist here. The inspector shall document all significant automation problems, including excessive maintenance, in the inspection report.

(c) Observation Trip. (2014)

Onboard observation trips should be of sufficient length to adequately assess the reliability of the systems. A trip of one to seven days is recommended depending upon the complexity of the plant and the crew reduction requirements. If possible, the inspector assigned should be one who is familiar with the vessel. The vessel should be operated as it would with reduced manning and the inspector should witness the crew's ability to respond to emergencies and system failures. The crew's response should be demonstrated through their performance of a reasonable number of randomly selected tests taken from the vessel's approved periodic safety test procedure. Interviews with the vessel's engineering officers and crew should be

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

conducted to discuss plant operation, the frequency and character of assistance-needed alarms, event logging methods, and maintenance policies. The inspector should submit a report that is sufficiently detailed to allow for an adequate review of all evolutions and/or problems witnessed, and should document all significant automation problems and any excessive maintenance needed. The OCMI may, after reviewing the results of the observation period, require an increase in engine room watch personnel until any problems are corrected, a longer trial period may also be required. The OCMI may also consider an increase in engine room watchstanders onboard other vessels of the same class previously approved for reduced manning levels. In these cases, the OCMI that issued COIs to any sister vessels should be consulted.

(d) Issuance of COI. (2014)

The COI may be amended once the request for reduced manning is approved and/or MAMS or PUMS is authorized. The following entry in the "Conditions of Operation" section shall be made identifying the mode of operation for which the propulsion plant is approved (see also the Common COI/SMD Sample Endorsements in the Annex):

APPROVED FOR [PERIODICALLY UNATTENDED] OR [MINIMALLY ATTENDED] MACHINERY SPACE OPERATION. THIS APPROVAL AND THE MINIMUM MANNING LEVEL SPECIFIED ON THIS CERTIFICATE OF INSPECTION ARE CONTINGENT UPON THE PROPER OPERATION OF THE AUTOMATED CONTROL/AUTOMATED MONITORING/AUTOMATED MACHINERY MANAGEMENT SYSTEM(S). ANY MAJOR ALTERATION OR FAILURE MUST BE REPORTED IMMEDIATELY TO THE NEAREST OCMI.

Based on a request and satisfactory final approval (Section A.3.b.(4) of this Chapter), the OCMI may consider a reduction in engineering personnel. For example, a typical full complement of engineering personnel [1 C/E, 3 A/Es, and 3 engineering ratings], for a three watch system on a deep-draft cargo or tank vessel, may be reduced based on PUMS by up to one A/E and the three ratings. Similarly, the full complement of engineering personnel may be reduced based on MAMS by up to the three ratings. These levels are based upon the minimum personnel necessary to stand the engine room watch, per 46 U.S.C. 8104(d), should a complete automation failure occur and live continuous watches be necessary. For appropriately automated vessels routinely engaged on limited routes, the OCMI may consider further reductions in the engineering complement based on regular access to shore-based maintenance support. However, the established manning level must not be less than the minimums stipulated by law or regulation. Prior to any reductions in engineering personnel, the OCMI must be satisfied with the

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

arrangements to ensure adequate watchkeeping, hours of rest, and provisions for onboard maintenance. All provisions for reductions in the engineering complement based on automation should be adequately specified in the manning proposal.

NOTE: An OSV of at least 6,000 GT ITC (500 GRT if GT ITC is not assigned) as defined in 46 CFR 125.160, for which the Coast Guard has accepted the use of automated systems to replace specific personnel pursuant to 46 CFR 62.50, must carry at least one credentialed assistant engineer, in addition to the Chief Engineer (46 CFR 15.825(c)). The OCMI may continue to require more than one assistant engineer under existing 46 CFR 15.825(d) (79 FR 48903 [August 18, 2014]). When making this determination, amongst other factors, the OCMI should consider length of voyage and availability of shore-based maintenance support. (2017)

Any major alteration or failures (i.e. casualties) of the automated vital systems must be reported immediately to the nearest OCMI. A major alteration of an automated vital system where a qualitative failure analysis (QFA) is required to be submitted (46 CFR 62.20-3(b)), onboard design verification tests (DVT) in accordance with 46 CFR 61.40-3 are required to be performed immediately after the installation of the automated equipment. Machinery or equipment failures, including those affecting the associated class notation, may result in the OCMI requiring a manned machinery plant operation. In some cases, an increase in manning may be warranted to support live continuous watches. See Section A.5 of this Chapter for discussion on Increased Manning Levels.

(e) Sample Reduced Scales (Seagoing and Great Lakes). (2017)

The following engine department manning levels have been developed as a general guideline for OCMI's. They are not all inclusive or absolute. The OCMI determines the minimum number of credentialed engineers required for the safe operation of inspected vessels (46 CFR 15.825(d)). The base manning level assumes that at least two individuals (one officer and one rating) are appropriate for each watch on a vessel with full manning. Refer to Chapter B2 for the full manning scales and tables depending on vessel particulars, route and service. Typically, for a vessel that meets the requirements for "minimally attended" (MAMS), one engineering officer is appropriate for each watch.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART B: VESSEL MANNING

CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS

Operating Mode		Chief Engineer ^[6]	Assistant Engineer ^[6]		QMED (Oilers) ^[5]
3-Watch System	Full Manning	1	If, 2 ^[2, 3] per B2; ↓	If, 3 ^[2, 3] per B2; ↓	3 ^[4]
3-Watch System	Reduced w/MAMS	1	Then, 2 ^[2, 3] ↓	Then, 3 ^[2, 3] ↓	-
3-Watch System	Reduced w/PUMS	1	2 ^[1, 3]		-
2-Watch System	Full Manning	1	If, 1 ^[2, 3] per B2; ↓	If, 2 ^[2, 3] per B2; ↓	2 ^[4]
2-Watch System	Reduced w/MAMS	1	Then, 1 ^[2, 3] ↓	Then, 2 ^[2, 3] ↓	-
2-Watch System	Reduced w/PUMS	1	1 ^[1, 3]		-

[1] The OCMI may consider additional reductions or substitutions for vessels routinely engaged on limited routes based on the availability of shore-based maintenance support. The established manning level must not be less than the minimums stipulated by law or regulation.

[2] Refer to Chapter B2 for full manning scales and tables depending on vessel route and service.

[3] See B3.F for Engineer computations and COI formatting.

[4] See B4.E for Engine Department Ratings.

[5] See B4.F for Maintenance-Persons and Maintenance Departments

[6] See C2.F for Trade Restricted Endorsements.

(f) Reflagged Vessels. (2014)

Reflags will be processed in accordance with this Chapter, except allowance for a reduced trial period can be considered if prior records (in English or with certified English translation) can be provided showing a history of safe operation, and that no major system changes are contemplated during reflagging. In no case will an initial manning level less than that required by the former Flag State be considered.

(g) Vessels Subject to Certain SOLAS Requirements. (2014, 2017)

The OCMI's determination of acceptable machinery space attendance stems from the systems, controls, and capabilities in the Administration's (U.S.) interpretation of SOLAS II-1/E, 46 CFR Part 62, which includes the provisions for regular inspections and routine tests, required by II-1/46.2. These provisions have been incorporated into the periodic inspection and testing regulations found in 46 CFR 61.40 and Part 62. These provisions apply where automated systems are provided to replace specific personnel in the control and observation of the engineering plant and spaces, or reduce

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

overall crew requirements (see Section A.1 of this Chapter). The arrangements must make sure that under all sailing conditions, including maneuvering, the safety of the vessel is equal to that of the same vessel with the entire plant under fully attended direct supervision. The approval to operate minimally attended or periodically unattended machinery spaces is subject to the requirements of 46 CFR Part 62, as well as SOLAS for internationally certificated vessels. Authorization shall be so stated on the COI as required by SOLAS II-1/E and recommended by Annex 4 of IMO Resolution A.1047(27), as amended, as discussed in paragraph 3.b.(4)(d) above. The applicability of SOLAS may be determined by GT ITC and could include self-propelled, dual-tonnage, cargo ships under 500 GRT but 500 GT ITC or more on international voyages, depending on keel laying date. The tonnage limits for determining 46 CFR Part 62 applicability were intended to align with SOLAS (see 53 FR 17826 [May 18, 1988]). See 46 CFR Subchapter L, Part 130 Subpart D for specific provisions pertaining to the automation of unattended machinery spaces on offshore supply vessels of 100 GRT or more.

(h) Alternate Compliance Program (ACP) / Maritime Security Program (MSP). (2014, 2017)

The preceding paragraphs identify the general policies and processes for evaluating reduced manning based on automation. Both the ACP and MSP may include additional specific provisions for plan review, testing, approval, trials and manning which are applicable only to those programs and which take precedence over this guidance. For additional information, refer to the latest Commandant guidance pertaining to vessels enrolled in the ACP or MSP. In addition, for vessels enrolled in the ACP, refer to the applicable ACP Supplement for specific requirements.

4. Annual Inspections. (2014)

Marine inspection personnel shall ascertain the performance of installed systems of those vessels that have reduced manning levels during annual inspections. In addition to the review of the vessel's logs, maintenance records and overtime sheets, credentialed officers and ratings should be interviewed. When vessels are required to carry engine maintenance personnel, any periods in which they are placed in a watch status must be noted. See Section B1.K.3 for additional guidance on inspection and enforcement protocols.

5. Increased Manning Levels.

Vessel manning levels that have been reduced due to the installation of automated systems or controls will be restored to conventional levels if the automated system develops a pattern of unreliable performance; isolated instances of "downtime" will not be basis for increased manning. The manning level will be adjusted only in the department affected by the malfunctioning system, and an appropriate amendment will be made to the COI. The increased manning level will remain in effect until corrective action has been taken and the system has been tested to the OCMI's satisfaction.

PART B: VESSEL MANNING**CHAPTER 6: MANNING REQUIREMENTS FOR AUTOMATED VESSELS**

The OCMI should take appropriate action to validate any complaints or reports detailing specific instances of repeated equipment failures, excessive overtime, or concerns regarding unsatisfactory performance of crews during emergency and operational evolutions onboard vessels having reduced manning. If the reports are confirmed, a reevaluation of the manning may be justified. The COI required manning must reflect the minimum safe manning level to comply with statutes and regulations. The OCMI should increase the required manning whenever a review of the work records indicates excessive workloads, or when statutory work hour limits are being exceeded, or in situations when the limits are met by the virtue of the vessel owner assigning a sufficient number of "other persons in the crew" to augment the required crew. Manning increases deemed necessary by the OCMI due to automation system failures or inability to safely operate and maintain the vessel for any reason should be reported to Commandant (CG-CVC). Automated machinery control and management system failures, design or component related, which may affect a class of vessels should also be reported to Commandant (CG-ENG).

See Section B1.K.3 for additional guidance on inspection and enforcement protocols, as well as Section B5.F.3 for additional discussion on U.S. Coast Guard responsibilities.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

A. General. (2014)

Part B, Chapters 1-7 (legacy Chapters 20-26), has been structured to interlink various elements affecting the safe manning and watchkeeping on U.S. vessels and should be referenced comprehensively. Refer to paragraph B1.A for a summary of all Chapters. This Chapter discusses the statutes and regulations that apply to the uninspected vessel industry. Although there are very few statutory requirements that allow the Coast Guard to regulate the manning of uninspected vessels, this Chapter will discuss those statutes and regulations that do apply to the uninspected vessel industry. The discussions and manning recommendations in this Chapter are not meant to be all-inclusive and should be used as a general guide only. (See Chapters B2, B3, B4 and B5 for discussions concerning manning and watchstanding qualifications necessary to meet U.S. and international requirements when applicable to certain vessels discussed in this Chapter.)

B. Towing Vessels (Including Integrated & Articulated Tug-Barges (ITBs / ATBs)).
 (2014, 2017)

Towing vessels are subject to various manning requirements depending largely on route, tonnage, service, and inspection status. See Chapter B3. Section G for the Towing Endorsement Table and additional information on which towing endorsements or combinations thereof, are required for various operations. See Chapter B2. Section W for the Subchapter M manning scales.

1. Definitions.

a. Oceans (Domestic Trade) Voyages. (2014)

An Oceans (domestic trade) voyage can be interpreted to include a voyage from any U.S. port to any other U.S. port. 46 U.S.C. 114 states that the term "United States", when used in a geographic sense, means the States of the United States, the District of Columbia, Guam, Puerto Rico, the Virgin Islands, American Samoa, the Northern Mariana Islands, and any other territory or possession of the United States. However, a Panama Canal transit constitutes an international voyage (see Historical and Statutory Notes, 46 U.S.C.A. 114 [West 2007]).

b. Near Coastal Voyages. (2014)

46 CFR 10.107 states, in part, that "near coastal" means ocean waters not more than 200 miles offshore from the U.S. and its possessions. See paragraph D of this Chapter regarding uninspected passenger vessels operating in U.S. near coastal waters, and Chapter B3 paragraph B.2.d.(2) for additional discussion pertaining to U.S. vessels that regularly operate in the near coastal waters of another country.

PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

2. Uninspected Towing Vessel Worksite Exclusion. (2014, 2017)

Workboat means a vessel that pushes, pulls, or hauls alongside within a worksite.

Worksite means an area specified by the cognizant OCMI within which workboats are operated over short distances for moving equipment in support of dredging, construction, maintenance, or repair work. A worksite may include shipyards, owner's yards, or lay-down areas used by marine construction projects. This definition does not include the movement of barges carrying oil or hazardous material in bulk.

The statute addressing officers on towing vessels, 46 U.S.C. 8904, requires a towing vessel that is at least 26 feet (7.9 meters) in length to be operated by a licensed individual. The U.S. Senate Committee on Commerce Report of June 27, 1972, however, described various situations in which the statute was not intended to apply. The following statement was included in the report: "The licensing requirement will apply only to those vessels which are documented to perform commercial service as towing vessels and will not apply to those vessels which are documented solely for other services or are not required to be documented. The vessels covered are those which perform towing services as a business and the bill does not cover vessels towing in an emergency or on an intermittent basis, not directly connected with the service for which the vessel may have been documented. Excluded from coverage would be, for instance, workboats which are used to move dredging equipment for short distances at the dredging site" (S. Rep. No. 926, 92nd Cong., 2nd sess., 2.). The import of the legislative history comment was that workboats, at a worksite, that may be called upon to move a piece of equipment a short distance at a worksite on an emergency or intermittent basis, would not be required to be operated by licensed individuals (credentialed officers). On the other hand, vessels engaged to perform towing services, including marine construction equipment, however intermittently, would be required to be operated by licensed individuals (credentialed officers). It is important to note that workboats, which tow barges on a fulltime basis, even though always at the worksite, are not operating on an emergency or intermittent basis and are not entitled to a worksite exclusion. While engaged exclusively within an OCMI specified worksite as a workboat, a towing vessel inspected under Subchapter M may be operated in accordance with this Section (see ANNEX-22 for sample COI endorsement).

Towing vessels not specifically engaged in the commercial towing service, operating solely as workboats in dredging operations may be exempt from the manning requirements of 46 U.S.C. 8904. Each case shall be carefully scrutinized to determine whether the exemption applies. The Coast Guard, therefore, must consider the facts of a particular situation in making a determination as to the applicability of the statute.

3. Navigation Watches. (2014, 2017)

There is no specific number of credentialed officers or crewmembers required on an uninspected towing vessel. Watchstanding requirements do, however, prescribe a minimum complement. 46 U.S.C. 8104(d), (g) and (h) require different watchstanding arrangements for the various types of towing vessels and towing operations. See Chapter B5 paragraph A.5.b for related discussion on two-watch arrangements and additional factors.

PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

- a. A 3-watch system is required for the credentialed officers, sailors, and oilers on seagoing towing vessels of 200 GRT or more, on a voyage of 600 nautical miles or more.
 - b. A 3-watch system is also required for the sailors and engineering personnel (such as oilers), where necessary for the direct control and observation of the engineering plant, on seagoing towing vessels between 100 and 200 GRT on a voyage of 600 nautical miles or more. In this situation the credentialed officers may be divided into a 2-watch system as allowed by 46 CFR 15.705(d).
 - c. A 2-watch system is permitted for the credentialed officers and crewmembers on seagoing towing vessels of 100 GRT or more when on a voyage less than 600 nautical miles.
 - d. Towing vessels not subject to the Officers' Competency Certificates Convention, 1936, including those not on the high seas (i.e., not operating beyond the boundary line) as well as those seagoing vessels of less than 200 GRT, may be divided into a 2-watch system regardless of the length of the voyage as permitted by 46 CFR 15.705(d).
4. Engineering Workers. (2014)
 Seagoing vessels of 200 GRT or more which employ or engage personnel to perform the duties of a chief engineer or engineer of the watch must employ appropriately credentialed engineers (see 46 U.S.C. 8304).
 5. Work Hour Limits. (2014)
 46 U.S.C. 8104(h) allows credentialed operators working aboard towing vessels subject to the provisions of 46 U.S.C. 8904 (e.g., vessels less than 200 GRT) to work no more than 12 hours in a consecutive 24-hour period. There is no similar maximum work hour limit for the crewmembers and ratings on towing vessels subject to 46 U.S.C. 8904, with some exceptions as follows. Seagoing towing vessels of more than 100 GRT are subject to the provisions of 46 U.S.C. 8104(d) (a credentialed officer or seaman may not be required to work more than 8 hours in one day). However, regardless of the route of the vessel, or work rules agreed to by crewmembers, individually or through collective bargaining, the owner and master (or credentialed operator) are required to provide an adequate and fit watch as per 46 CFR 15.601, 15.705 and 15.1111. Consequently, if the credentialed officers or crewmembers have no relief and are too fatigued to stand an alert watch, a hazardous condition is created and the owner and/or master should not permit the vessel to continue to operate until the situation is remedied.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

C. Self-Propelled Vessels 200 GRT Or More. (2014, 2017)

Documented vessels of 200 GRT or more operating on the high seas, including commercial fishing industry vessels, are subject to the provisions of 46 U.S.C. 8304. Title 46 U.S.C. 8304 considers 'high seas' to mean waters seaward of the Boundary Line. Accordingly, the master, mates and engineers on any vessel subject to 46 U.S.C. 8304 (whether uninspected or recreational) are required to hold a Coast Guard-issued license or MMC officer endorsement to serve in that capacity (see the Commandant's Decision on Appeal, M/V MR. TERRIBLE (2010)). Subject vessels are required to have a master (46 CFR 15.805). While the regulations do not explicitly state a minimum number of mates or engineers for these vessels, individuals serving in those capacities must be credentialed or licensed appropriately.

1. Sample Scales. (2014, 2017)

The following manning scale is considered appropriate for such vessels:

Route	Master	Mate	Able Seamen	Ordinary Seamen	Radio Officers	Deckhands	Certificated Lifeboatmen	Chief Engineer	Assistant Engineer	QMED (Fireman/Watertender)	QMED (Oilers)	Tankermen
General Operations	1	*1	-	-	-	-	-	*1	*1	-	*	-
* Denotes variable												

NOTE: See CGMS: Engineer Officer Endorsements on Uninspected Fishing Vessels (R 101915Z DEC 14) and CG-CVC Policy Letter 11-11 (CH1) for relaxed enforcement measures on Uninspected Commercial Fishing Vessels until October 15, 2015 – unless specified otherwise. See R 301848Z JUL 15 for Guidance on Enforcement of Engineer Officer Endorsements on Uninspected Commercial Fishing Vessels. (2014, 2017)

2. Variables.

a. Watches. (2014, 2017)

Generally, there are no statutory requirements for watch systems or minimum number of credentialed officers on documented recreational vessels and fishing vessels, with the exception of certain fish processing vessels or fish tending vessels engaged in the Aleutian trade (See also Figure B7-1). It is the master's responsibility to ensure an adequate watch for the safety of the vessel. While there may be individuals who can routinely and safely perform work for periods in excess of 12 consecutive hours, the rigors of watchkeeping at sea greatly increase the likelihood of fatigue beyond such a period. Between 12 and 24 hours of operation there is a gray area in which the OCMI must judge the prudence of the master's decision to sail without a second credentialed officer or licensed individual to implement the watch, based on the specific circumstances.

PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

b. Mates. (2014)

If a vessel is operating at sea for extended periods of time it may be assumed that the master of the vessel must, due to normal sleep and body function requirements, relinquish the watch to another crewmember. When this occurs, the person who is assigned the watch becomes the mate and is the person in charge of navigating or maneuvering the vessel. His or her actual status as "mate" does not diminish even if his/her standing orders are to notify the master upon the slightest change of watch conditions which could impact the safety of the vessel. While there is no direct authority by which the Coast Guard can require a subject vessel to carry both a master and a mate in terms of a "manning requirement," if the master of the vessel is found to be too fatigued to stand watch and there is no credentialed mate to assume the duties of officer in charge of the navigation watch, then the master of the vessel could be charged with negligence for failure to maintain an adequate watch. OCMI's should strongly encourage subject vessels of 200 GRT or more operating in excess of 12 hours to have at least two credentialed officers assigned to prevent fatigue. (See Chapters B3 and B5 for additional discussions.) The controlling statute requires only that persons serving as "officers" shall hold a credential endorsed for their positions.

c. Engineers. (2014)

An individual engaged or employed to perform the duties of chief engineer or as an individual in charge of an engineering watch, must hold an appropriately endorsed MMC authoring service as a chief engineer or an assistant engineer, respectively. For mechanically-propelled vessels this is largely predicated upon the particular capabilities of the engineering system and may vary from vessel to vessel. See 46 CFR 15.701, 15.820, and 15.825.

3. Vessels Fishing On Other Than The High Seas. (2014)

Motor vessels of any size, regardless of their numbering or documentation, engaged exclusively in fishing on other than the high seas, are not currently subject to any federal manning requirements. Title 46 U.S.C. 12131 does require that a documented vessel be placed under the command of a citizen of the United States; however, unless subject to 46 U.S.C. 8304, this person may be unlicensed.

4. GMDSS And Commercial Fishing Vessels. (2014)

Traditionally, commercial fishing vessels have been required to carry the radiotelegraph and radiotelephone equipment, including GMDSS equipment, specified for cargo ships in the Communications Act of 1934 and in the Commission's Rules (see 64 FR 98-296, 26 [February 9, 1999]). However, commercial fishing vessels that are otherwise subject to the SOLAS GMDSS requirements have received a limited, temporary waiver of certain equipment carriage requirements in Sea Areas A1 and A2 (see Waiver of Certain GMDSS Rules Applicable to Fishing Vessels and Small Passenger Vessels, Order, 14 FCC Rcd 528, FCC 98-296 (1998)). The waiver is available only for vessels that remain within the specified communications ranges (A1 and A2), and is not applicable to vessels that travel in Sea Area A3 or beyond. Accordingly, in the absence of an individual exemption, such

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

vessels must be fitted with the full complement of required GMDSS equipment and manned with two licensed GMDSS radio operators.

NOTE: See CG-CVC Policy Letter 15-06, series, for VHF-DSC Radio Equipment Installation Requirements for Inspected Passenger and Commercial Fishing Vessels. (2017)

- D. Uninspected Passenger Vessels (<100 GRT) [46 U.S.C. 2101(42)(B)]. (2014, 2017)
 Title 46 U.S.C. 8903, and 46 CFR 15.605 require each self-propelled uninspected passenger vessel to be under the "direction and control" of a credentialed individual as prescribed by regulation. In this regard, if a water-skier, or para-sailor is towed for hire, the vessel is considered to be carrying passengers for hire, and the operator of the vessel must be appropriately endorsed. See MSIB 04-15 for water jet devices (WJD), such as Jetpacks. Credentialed masters, mates, or operators of uninspected passenger vessels (OUPV) may serve as person in charge of navigation. Under 46 CFR 10.107 and 11.467, an endorsement for OUPV near-coastal is limited to domestic near-coastal waters not more than 100 miles offshore from the U.S. and its possessions (See paragraph B.1.b of this Chapter for additional discussion of the definition of "near coastal") [not on an international voyage (46 CFR 15.805(a)(7))], as well as Great Lakes and all inland waters. For uninspected passenger vessels of at least 100 GRT, as defined by 46 U.S.C. 2101(42)(A), see Chapter B5.
1. Work Hour Limitations. (2014)
 46 U.S.C. 8104(b) provides that credentialed individuals on oceangoing vessels of not more than 100 GRT "may not be required" to work more than 12 hours in a 24-hour period while at sea. Credentialed individuals serving as OUPV may, however, voluntarily work more than 12 hours in a 24-hour period. (See Chapters B3 and B5 for additional discussions.)
 2. Adequate Watches. (2014)
 While an OUPV may work more than 12 hours, he or she must maintain an adequate watch. If the OUPV has no relief and is too fatigued to stand an alert watch, then that individual would be negligent for failure to maintain an adequate watch. While there may be individuals who can routinely and safely perform work for periods in excess of 12 consecutive hours, the rigors of watchkeeping at sea greatly increase the likelihood of fatigue beyond such a period. Between 12 and 24 hours of operation, there is a gray area in which the OCMI must judge the prudence of the credentialed operator's decision to sail without a second credentialed operator, based on the specific circumstances. Charter fishing and dive vessels routinely operating more than 24 consecutive hours with only one credentialed operator present a dangerous situation, raising significant issues of negligence on the part of the OUPV and owner for failure to provide an adequate watch.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

3. Enforcement Action. (2014)

OCMIs should strongly encourage uninspected passenger vessels operating in excess of 12 hours to have at least two credentialed operators assigned to prevent fatigue. It has been suggested by some operators that a qualified seaman could be left at the helm while the credentialed operator sleeps close by. This is an untenable position. Title 46 U.S.C. 8903 mandates the vessel be operated by a credentialed individual; the Coast Guard does not have the discretion to allow any rating or crewmember to control the vessel without supervision. When a sole credentialed OUPV is assigned to a vessel and is found to have been unfit to maintain vigilance due to fatigue, or allows a rating or crewmember to control the vessel while the OUPV sleeps, the OCMI should consider charging the credentialed operator with negligence, misconduct, or violation of law, as may be appropriate to the specific circumstances.

NOTE: Section 319 of the Howard Coble Coast Guard and Maritime Transportation Act of 2014 amended the law concerning Uninspected Passenger Vessel operations for vessels in the U.S. Virgin Islands. See Sector San Juan Maritime Safety and Security Bulletin 03-15. (2017)

E. Oceanographic Research Vessels. (2014)

Undocumented, uninspected oceanographic research vessels under 200 GRT are not subject to the provisions of 46 U.S.C. 8304 or 46 CFR 15.701. However, if they are of 100 GRT or more, they are subject to 46 U.S.C. 8702 and 8104.

F. Manning Charts. (2014)

Figure B7-1 lists typical requirements and the references for citizenship, manning, and watch requirements that apply to uninspected, documented, vessels (including certain yachts). It is not meant to be all-inclusive and should be used as a general guide only. In certain cases STCW and SOLAS will apply to uninspected vessels. See Chapters B2, B3, and B4 for additional guidance.

(INCLUDING CERTAIN YACHTS)

Figure B7-1: Manning Requirements And References For Documented Uninspected Vessels
(Including Certain Yachts) (Con't)

NOTES:

1. Small Fish Processor:
 - (a) no more than 1,600 GRT, entering service before 1/1/88, or
 - (b) 100 GRT or over, entering service after 12/31/87 with no more than 16 people on board primarily employed in the preparation of fish and fish products.
2. Medium Fish Processor:
 - (a) over 1,600 GRT but not more than 5,000 GRT, entering service before 1/1/88, or
 - (b) 100 GRT or over, entering service after 12/31/87 with more than 16 people on board primarily employed in the preparation of fish and fish products.
3. Inside the exclusive economic zone (EEZ): On a fishing, fish processing, or fish tender vessel that is engaged in the fisheries of the EEZ, 75% of the unlicensed seamen must be either U.S. Citizens or aliens lawfully admitted to the U.S. for permanent residence. The remaining 25% may be any other alien allowed to be employed under the Immigration and Nationality Act [8 U.S.C. 1101]. Masters, chief engineers, deck watch officers, engineering watch officers and radio officers must be U.S. citizens. [46 U.S.C. 8103].
4. A person in charge of navigating or maneuvering vessels of 200 GRT or more operating outside of the Boundary Lines must be licensed (credentialed officer) as per 46 U.S.C. 8304. [46 CFR 15.810(c)]

NOTE: See CGMS: Engineer Officer Endorsements on Uninspected Fishing Vessels (R 101915Z DEC 14) and CG-CVC Policy Letter 11-11 (CH1) for relaxed enforcement measures on Uninspected Commercial Fishing Vessels until October 15, 2015 – unless specified otherwise. See R 301848Z JUL 15 for Guidance on Enforcement of Engineer Officer Endorsements on Uninspected Commercial Fishing Vessels. (2014, 2017)

5. A person on a seagoing mechanically propelled vessel performing the duties of chief engineer and anyone in charge of an engineering watch must be properly licensed (credentialed officer). [46 CFR 15.820(c) and 15.825(a)]. Title 46 CFR Part 62 and Chapter (B6) are not necessarily applicable to uninspected vessels. However, they may be used as an alternative in cases where safe manning documentation is desired. Alternatively, for uninspected towing vessels to receive safe manning documentation endorsed for Periodically Unattended Machinery Space (PUMS), operators may present the OCMI with a Certificate of Class appropriately endorsed for unattended machinery status or meet NVIC 1-78 (see Chapter B3, Section B.2.d.(2)(e)3).

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

Figure B7-1: Manning Requirements And References For Documented Uninspected Vessels
(Including Certain Yachts) (Con't)

NOTE: See CGMS: Engineer Officer Endorsements on Uninspected Fishing Vessels (R 101915Z DEC 14) and CG-CVC Policy Letter 11-11 (CH1) for relaxed enforcement measures on Uninspected Commercial Fishing Vessels until October 15, 2015 – unless specified otherwise. See R 301848Z JUL 15 for Guidance on Enforcement of Engineer Officer Endorsements on Uninspected Commercial Fishing Vessels. (2014, 2017)

6. Fish tender vessels engaged in the Aleutian trade must comply with 46 U.S.C. 8702(b). As a general matter, section 8702(b) requires 65% of the unlicensed deck crew to be ABs, except that this may be reduced to 50% for fish tender vessel engaged in the Aleutian trade. Section 8104(o)(1) requires fish tender vessels of not more than 500 GRT to divide the licensed (credentialed officers) individuals and crewmembers into a 3-watch system. However, Section 8104(o)(2) allows a 2-watch system for fish tender vessels operating or purchased to be used in the trade before September 8, 1990, and entered into service before June 1, 1992. [46 CFR 15.705(e)]
7. Under 46 U.S.C. 8701, with certain exceptions, a merchant mariner's document/credential (MMD/MMC) is required for personnel to be employed on vessels of 100 GRT or more.
8. Vessels not included under the exemptions of 46 U.S.C. 8702(a) must comply with 8702(b). In general, Section 8702(b) requires 65% of the unlicensed deck crew to be ABs for a 3-watch system and 50% for a 2-watch system. Section 8104 determines the applicable watch system. [46 CFR 15.401, and 15.705]
9. 46 U.S.C. 8104(g) allows licensed (credentialed) officers and members of the crew to be divided into not less than two watches while at sea. [46 CFR 15.705(c)(1) revised by 46 U.S.C. 8104(g), as amended (see 80 FR 65165 [October 26, 2015])]
10. 46 U.S.C. 8104(c) stipulates that, on a towing vessel operating on the Great Lakes, a licensed or unlicensed seamen in the deck or engine department may not be required to work more than 8 hours in one day or permitted to work more than 15 hours in any 24-hour period, or more than 36 hours in any 72-hour period, except in an emergency when life or property are endangered. Although a licensed or unlicensed seamen in the deck or engine department cannot be compelled to work more than 8 hours in one day, they may consent to working more than 8 hours in one day so long as they do not work more than 15 hours in any 24-hour period, or more than 36 hours in any 72-hour period, except in an emergency when life or property are endangered. See Chapter B5, paragraph C. on "Required" Vs "Permitted" Work Hour Limits. In practice this could result in a two or three watch system for operations greater than 8 hours depending on how require vs. permitted work hour limits are implemented onboard. See paragraph B.3.d of this Chapter for related discussion on towing vessels, not on the high seas, employing a two-watch system.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART B: VESSEL MANNING
CHAPTER 7: MANNING OF UNINSPECTED VESSELS
(INCLUDING CERTAIN YACHTS)

Figure B7-1: Manning Requirements And References For Documented Uninspected Vessels
(Including Certain Yachts) (Con't)

11. Subject to exceptions, 46 U.S.C. 8104(h) permits a master or mate (pilot) operating a towing vessel that is at least 26 feet in length measured from end to end over the deck (excluding sheer) to work not more than 12 hours in a consecutive 24 hour period except in an emergency. The Coast Guard interprets this, in conjunction with other provisions of the law, to permit masters or mates (pilots) serving as operators of towing vessels that are not subject to the provisions of the Officers' Competency Certificates Convention, 1936, to be divided into two watches regardless of the length of the voyage (46 CFR 15.705(d)). See Chapter B5 paragraph A.5.b and paragraph B.3.d of this Chapter for related discussion on two-watch arrangements and additional factors.
12. 46 U.S.C. 8903 requires the OUPV to be licensed by the Secretary under prescribed regulations. 46 U.S.C. 8104(b) provides that licensed individuals (credentialed officers) on oceangoing vessels of not more than 100 GRT "may not be required" to work more than 12 hours in a 24-hour period while at sea. Therefore an uninspected passenger vessel operating greater than 12 hours should have a two watch system. If the OUPV has no relief and is too fatigued to stand an alert watch, then that individual would be negligent for failure to maintain an adequate watch. [46 CFR 15.601, 15.605, 15.705 and 15.905]
13. On every uninspected passenger vessel of at least 100 GRT, there must be an individual holding an appropriate license or valid MMC with endorsement as master and mate, depending on watches (see 46 U.S.C. 8104). [46 CFR 15.601, 15.605, 15.705, 15.805, and 15.905]

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART C: SHIPMENT AND SERVICE**FOREWORD**

Part C [legacy Chapters 18-19] details the laws and regulations pertaining to the shipment and discharge of seamen, including guidance on the structure of merchant mariner credentials and the endorsement equivalents permitted for service on certain U.S. vessels. The information in Part C has been restructured to account for revised regulations, updated Coast Guard forms and should be referenced comprehensively with Parts A and B.

Chapter C1 contains policy and guidance for uniform application of the statutes and regulations that relate to the protection and relief of seamen, including shipment and discharge. Chapter C2 provides supplementary guidance and discussion on the structure of mariner credentials including limitations (i.e. route, tonnage, grade, propulsion power, propulsion mode, and vessel type) and the endorsement equivalents permitted for service on certain U.S. vessels.

3. Deserting Seamen	C1-10
4. Destitute Seamen	C1-10

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN****A. Laws. (2014)**

The laws contained in Title 46 U.S.C., Subtitle II, Part G provide for the protection and relief of seamen, including shipment and discharge.

NOTE: Where appropriate, the term 'seaman' or 'seamen' has been replaced with 'merchant mariner' to align terminology with 46 CFR Subchapter B, Part 14 (Shipment and Discharge of Merchant Mariners) and other Coast Guard regulations. In other cases the terms 'seaman' or 'seamen' have been retained for consistency when referencing a statute in Title 46 U.S.C., Subtitle II (Vessels and Seamen). (2014)

B. Background. (2014)

In 1979, the Department of Transportation Appropriation Bill prohibited the use of funds for shipping commissioners, and thereafter, masters of U.S. merchant vessels assumed the duties for the shipment and discharge of seamen. NVIC 8-79 was originally published to give masters guidelines for these new duties. However, the recodification of Title 46, United States Code and a multitude of procedural changes made NVIC 8-79 outdated. In keeping with the Coast Guard's responsibility to enforce laws pertaining to seamen Protection and Relief, new guidelines were published in NVIC 1-86 for the use by masters aboard U.S. flag vessels required by law to sign on and discharge merchant mariners. NVIC 1-86 continues to provide a useful framework for completing shipping articles, certificates of discharge, and official logbooks.

C. Compliance With Statutory Requirements. (2014)

The shipment and discharge of seamen is controlled by law. Compliance with these laws and the regulations promulgated thereunder is mandatory in the case of seamen who are employed on all United States flag vessels on certain foreign or intercoastal voyages, including vessels serving primarily overseas without returning to any American or foreign port or place (see NVIC 1-86). The rules and regulations contained in 46 CFR Part 14 deal with the shipment and discharge of merchant mariners aboard certain vessels of the United States; Subpart A-General, Subpart B-Shipment of Merchant Mariners, and Subpart C-Discharge of Merchant Mariners. For specific information regarding Oceanographic Research Vessels, reference 46 CFR Part 14, Subpart D. For additional information on official logbooks, including statutory requirements, see paragraph G below.

NOTE: See NVIC 02-13 for guidance on implementing the Maritime Labour Convention, 2006. (2017)

D. Coast Guard Address. (2014)

Each form or report required to be submitted to the National Maritime Center should be forwarded to the addresses listed in 46 CFR 14.103.

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN****E. Shipment Of Merchant Mariners.****1. Production Of Credentials By Merchant Mariners Signing Shipping Articles. (2014)**

On engagement for a voyage upon which shipping articles are required, each merchant mariner must present to the master or individual in charge of the vessel every document, certificate, credential, or license required by law for the service the mariner would perform (46 CFR 14.205).

2. Mutilated Credentials. (2014)

A mutilated U.S. Merchant Mariner Credential should not be accepted for employment of the seaman. A credential should not be accepted when it has been materially changed in physical appearance or composition including - indistinguishable personal and credential data (including photograph), evidence of tampering or alteration, and damage beyond recognition.

3. Fraudulent Use Of Credentials. (2014)

The fraudulent use of Merchant Mariner Credentials breaks down the system which the credentials were intended to serve (e.g., a proper identification of the holder and his/her qualifications). If the fraudulent use of a Merchant Mariner Credential is found, the master or individual in charge of the vessel should not allow the bearer to sign on the shipping articles. The master or individual in charge of the vessel should contact the nearest Officer in Charge, Marine Inspection (OCMI) and report the incident.

4. Contractual Relationship Between Master And Crew. (2014)

"Shipping Articles" is the statutory name given to the agreement signed by the members of the crew and the master with respect to a particular voyage or term of employment. Since the laws have certain specific requirements that must be met, the wording of the articles and especially the voyage description must be clear and concise. Compliance with these laws and the regulations promulgated there under are mandatory in the case of merchant mariners who are employed on United States flag vessels on foreign, intercoastal, or coastwise voyages as follows:

- a. 46 CFR 14.201: Voyages upon which shipping articles are required; and,
- b. 46 CFR 14.203: Voyages upon which shipping articles are not required.

If otherwise required by 46 CFR 14.201(b) - a vessel's status as "inspected" or "uninspected" does not necessarily preclude it from these requirements, unless specifically excluded under 46 CFR 14.203.

A voyage is defined by the parties involved and stated in specific terms on the shipping articles. A voyage may be from port to port, port to place, place to place, etc.

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**5. Form Of Shipping Articles. (2014)

The content and form of shipping articles must conform to the provisions of 46 CFR 14.207. The Office of Management and Budget approved the updated version of the Shipping Articles, CG-705A (OMB Number: 1625-0006), used to execute shipping articles. The obsolete paper format of these forms has been in use since World War II and was last revised in the early 1980s. The data collected on the updated forms is nearly identical to the previous version; however, the size of the forms has significantly changed to the standard paper size (8.5 x 11 inches) to accommodate modern technology. The Coast Guard will not stock the updated forms in paper format. In accordance with 46 CFR 14.207(b), these forms are available electronically in a .PDF fill-able format at the National Maritime Center's website. Any company that electronically prepares the articles may develop its own software or buy it off the shelf; but, in either of these cases, it must secure approval to use the software for these purposes from the National Maritime Center (46 CFR 14.207(c)).

6. Number And Disposition Of Shipping Articles And Particulars Of Engagement. (2014)
See 46 CFR 14.209.7. Changes To Shipping Articles. (2014)

In all cases where there are additions to the shipping articles, such additions must be carefully scrutinized to see that they comply with the law and must be read and explained to the seamen before they sign the articles. Under no circumstances should any changes be made to the shipping articles after signature by the seamen.

8. Signing On Crew Replacements. (2014, 2017)

If, after the complete crew has been signed on, shipment of replacement seamen becomes necessary for any reason, only seamen who are properly qualified for the positions they are to assume may be employed. The master assumes the responsibility that the replacement seamen are properly qualified. When engaged in foreign voyages, if a desertion or casualty results in the replacement, 46 U.S.C. 10309(a) requires the master to report the transaction immediately to the United States consular officer upon arrival at the first foreign port at which the vessel arrives. Since United States consular officers are not located at every foreign port, the statutory report should be made to a United States consular officer nearest to the first port or place in the foreign country at which the vessel arrives. The report may be made by facsimile or similar correspondence (e.g. e-mail) whereupon an entry should be made in the vessel's official logbook indicating that this report has been made. A copy of the report may then be attached to the shipping articles. The U.S. Department of State has detailed special instructions to consular officers in the Department of State Foreign Affairs Manual (FAM) Volume 7, Section 7 FAM 730-734, which can be found online at <https://fam.state.gov/>.

9. Employment Of Alien Cadets.

When, as part of the training of the Merchant Marine Cadet Corps of the United States Merchant Marine Academy, alien cadets are assigned to vessels for which a construction or operating differential subsidy has been granted, they shall be excluded from any

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**

computation of aliens in the crews. The alien cadets assigned must present documentary evidence of their relationship with the academy to the master at the time of signing on the shipping articles. An appropriate notation that such alien cadets are not included in computing the percentage of citizens in the crew should be made by the master in the block provided for entering citizenship information.

10. Posting Of Copy Of Shipping Articles. (2014)

See 46 CFR 14.211.

11. Posting The "Provisions" Text. (2014)

In accordance with 46 U.S.C. 10303, a copy of the following text must be posted in a conspicuous place in the galley and forecabin: "A seaman shall be served at least 3 meals a day that total at least 3,100 calories, including adequate water and adequate protein, vitamins and minerals in accordance with the United States Recommended Daily Allowances."

F. Discharge Of Merchant Mariners. (2014)

1. Completing Entries In Shipping Articles At End Of Voyage. (2014)

See 46 CFR 14.309 and Enclosure (1) of NVIC 1-86.

2. Certificate Of Discharge to Merchant Mariners, Form CG-718A. (2014)

See 46 CFR 14.307. The prescribed format for a certificate of discharge is the same as the present Certificate of Discharge to Merchant Mariners, Form CG-718A. The Coast Guard will not stock the updated forms in paper format. These forms are available electronically in a .PDF fill-able format at the National Maritime Center's website.

3. Use Of Continuous Discharge Book (CDB). (2014)

See 46 CFR 14.305 for continued usage of existing CDBs. Form CG-719A has been discontinued, but may be maintained by a Merchant Mariner.

4. Discharge Of Seamen In A Foreign Port Or Place. (2014)

See also 46 CFR 14.303. When a seaman is discharged in a foreign port or place, the master must make the required entries on the Shipping Articles, and on the Certificate of Discharge to Merchant Mariners, Form CG-718A. Upon the request of the master or a mariner, the consular officer shall discharge the mariner in accordance with the requirements of 46 U.S.C. 10318.

5. Discharge Of Seamen In A Foreign Port Or Place, Special Cases. (2014, 2017)

The U.S. Department of State has detailed special instructions to consular officers in the Department of State Foreign Affairs Manual (FAM) Volume 7, Section 7 FAM 730-734, which can be found online at <https://fam.state.gov/>.

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**

- a. When a seaman, incapacitated from service by injury or illness, is on board a vessel and it is impractical for the vessel's master to make a personal appearance before a United States consular officer, the seaman may be sent to the consular officer. The consul will provide care for the seaman and defray the cost of the seaman's maintenance and transportation when the following conditions are met:
 - (1) When the condition of the injured or ill seaman is such that prompt medical attendance is necessary and cannot be furnished shipboard; and
 - (2) The master cannot proceed with the seaman to the consul without risk to the crew, the vessel or the cargo.
- b. When the master cannot appear before the consul in person, the master will provide the consul in writing a full statement of the facts that require the discharge of the seaman, together with a statement of the reasons why the master is unable to appear before the consul. The statement should cover the usual particulars set forth in a discharge and should be accompanied by an account of the wages due with the funds to meet such wages, or (if the cash is not available) with an order for the owner for the amount due.
- c. If the consul considers the statement satisfactory, the seaman may be discharged as if the master were present.
- d. If the consul does not consider the statement satisfactory, and the condition of the seaman permits, the consul will decline to grant the discharge and direct that the seaman be returned to the vessel at its expense.
- e. When the condition of the injured or ill seaman is such that the seaman is incapable of completing the release for discharge at the time of removal from the vessel, the master should complete the master's portion of the Mutual Release and place it with the seaman.
 - (1) If the seaman possesses a Merchant Mariner Credential, the master must complete a Certificate of Discharge, Form CG-718A, and make the proper entries on the ship's articles (46 CFR 14, 303, 14.307, 14.309). Form CG-718A must be retained by the master until the termination of the voyage, at which time it must be delivered to the vessel's owner or agent along with shipping articles. Upon completion and presentation of the Mutual Release to the vessel's owner or agent, the seaman must receive all wages due. Form CG-718A must then be signed by the seaman and the original given to him/her. A copy of Form CG-718A must be forwarded to the National Maritime Center in accordance with 46 CFR 14.311. At this time a notation of the completion of the release should be made on the shipping articles with the Mutual Release attached.
 - (2) If the seaman possesses a Continuous Discharge Book, the master must make the proper entries in the book, on the shipping articles and complete Form CG-718A, which must be retained by the master until the termination of the voyage, at which time it must be delivered to the vessel's owner or agent along with the

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**

shipping articles (46 CFR 14.307). Upon completion and presentation of a Mutual Release to the vessel's owner or agent, the seaman must receive all wages due. Form CG-718A must then be signed by the seaman and a copy or electronic copy forwarded to the National Maritime Center (NMC-4). At this time a notation of the completion of the release should be made on the shipping articles with the Mutual Release attached. For information on reporting the discharge of merchant mariners see 46 CFR 14.311.

6. Crew Replacements. (2014)

When crew vacancies occur, a vessel may continue to be navigated if the vacancies are filled with replacements of the same or higher grade or rating. When vacancies occur for any reason overseas, and U.S. credentialed personnel are not available, 46 U.S.C. 8103(e) permits a non-citizen possessing equivalent licenses, documents and/or qualifications to be employed as a replacement until the vessel's first return to a port at which in the most expeditious manner a replacement who is a citizen of the United States can be obtained. Neither the master nor the Radio Officer can be replaced with non-citizens. The master bears the responsibility to assure such personnel are qualified and, once aboard are trained for their duties, as well as having the ability to communicate in English. Refer to Part B, Chapter 1.I of this Manual for a detailed discussion of "sailing short" and filling vacancies with foreign crewmembers.

7. Reporting Crew Shortage. (2014)

- a. 46 U.S.C. 8101 permits a vessel to be navigated without all of the required positions being filled if:
 - (1) Such vacancies occurred without the consent, fault or collusion of the master, owner or any other person interested in the vessel;
 - (2) The master is unable to obtain replacements of the same or higher grade or rating to fill the vacant positions; and
 - (3) It is the judgment of the master that the vessel is sufficiently manned to safely continue the voyage.
- b. In all cases where an inspected vessel, having been deprived of the services of crewmembers and is navigated with either fewer crewmembers on board than the complement for the vessel calls for, or with replacements of lower grade or rating, 46 U.S.C. 8101(e) and 46 CFR 15.725, require the master to report the shortage and explain the cause of it, in writing, to the nearest OCMI. The master need not obtain permission to sail short, but must report the shortage within 12 hours of the vessel's arrival at its destination. No particular form is required to be used in making such a report. Refer to Part B, Chapter 1.I of this Manual for a detailed discussion of "sailing short."

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**

c. Masters filing the report should:

- (1) Include the name and mariner reference number of the crew who left the vessel;
- (2) State the cause of the shortage and the port or place at which it occurred;
- (3) Certify that no replacements of the same grade or rating were obtainable; and
- (4) State that in his/her judgment the vessel was sufficiently manned.

8. Reporting Change Of Masters.

If there has been a change of masters during the voyage, the relieving master must note the change and the effective date on the face of the shipping articles in the blank space to the left of the section headed "Citizenship Requirements." The date of change noted should concur with any entry in the official logbook pertaining to the change of masters.

9. Number And Disposition Of Particulars Of Discharge Page. (2014)

The Particulars of Discharge page for foreign and intercoastal voyages must be legibly and accurately prepared in duplicate and signed by the master and each seaman engaged on a particular voyage. It must be attached to the Shipping Articles and Particulars of Engagement page with copies of the Certificate of Discharge and held by the company. For information on reporting the discharge of merchant mariners see 46 CFR 14.311.

G. Official Logbooks.

1. Laws. (2014)

In accordance with 46 U.S.C. 11301, except a vessel on a voyage from a port in the United States to a port in Canada, a vessel of the United States shall have an official logbook if the vessel is:

- a. On a voyage from a port in the United States to a foreign port; or
- b. Of at least 100 GRT and is on a voyage between a port of the United States on the Atlantic Ocean and on the Pacific Ocean.

The official logbook shall be maintained as specified in statute (46 U.S.C. 11301) and regulations (see paragraph G.2). The official logbook should be submitted to the OCMI at the port where the termination of the voyage takes place. It is not to be forwarded to Coast Guard Headquarters. The official logbook should be reviewed by the OCMI in accordance with MSM Volume V, Part B Chapter 9.B. and NVIC 1-86.

NOTE: Section 607 of the Coast Guard Authorization Act of 2010 amended the existing 46 U.S. Code Chapter 113 by adding a new section titled: 11304 – Additional Logbook and Entry Requirements. However, implementing regulations will be necessary to give these amendments full effect. (2014)

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**2. Regulations. (2014)

- a. Title 46 U.S.C. 11301-11303 and supporting regulations require most merchant vessels to maintain an official logbook. Specifically 46 CFR Subparts 35.07-5 (Tank Vessels), 78.37-3 (Passenger Vessels), 97.35-3 (Cargo and Miscellaneous Vessels), 109.431 (Mobile Offshore Drilling Units), 131.610 (Offshore Supply Vessels), 122.280 & 185.280 (Small Passenger Vessels), and 196.35-3 (Oceanographic Research Vessels) address the requirements for maintaining official logbooks on board certain vessels. These regulations are applicable to U.S. vessels which operate solely overseas, without returning to the U.S.
- b. Most regulations (see preceding paragraph) provide that, the master or person in charge of a vessel that is not required by 46 U.S.C. 11301 to have an official logbook, shall maintain, on board, an unofficial logbook or record in any form desired for the purposes of making entries therein as required by law or regulations in the subchapter applicable to the vessel. Such logs or records are not filed with the OCMI, but must be kept available for review by a marine inspector for a period of 1 year after the date to which the records refer. Separate records of tests and inspections of fire-fighting equipment must be maintained with the vessel's logs for the period of validity of the vessel's certificate of inspection.

3. Background. (2014)

- a. The official logbook is the vehicle through which any statutory and regulatory record keeping requirements are maintained. The official logbook contains information about the voyage, the vessel's crew, drills, and operations conducted during the voyage. Official logbook entries identify all particulars of the voyage, including the name of the ship, official number, port of registry, tonnage, names and merchant mariner credential reference numbers of the master and crew, the nature of the voyage, and class of ship. In addition, it also contains entries for the vessel's drafts, maintenance of watertight integrity of the ship, drills and inspections, crew list and report of character, a summary of laws applicable to logbooks, and miscellaneous entries. In most cases the regulations denote that when a voyage is completed, or after a specified time has elapsed, the master shall file the official logbook containing required entries with the OCMI at or nearest the port where the vessel may be. For vessels which are not engaged in routine voyages (e.g. vessels serving primarily overseas without returning to any American port or place), requests for alternative submittal periods should be arranged with the cognizant OCMI.
- b. The Coast Guard, National Maritime Center, gratuitously furnishes to masters of vessels of the United States the official logbook as Form CG-706B. Form CG-706C has been discontinued. In order to obtain hard copies of the official logbook for use, companies should send a request to the National Maritime Center. An automated request process can be found on the National Maritime Center's website at www.uscg.mil/nmc.

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**

4. Character Entry By Master Upon Discharge Of Merchant Mariners. (2014)
Upon the discharge of every mariner, the master must enter in the official logbook a report of the conduct, character and qualifications of the person discharged or state that an opinion will not be given.
 5. Logbook Entries. (2014)
All masters and officers making entries in the official logbook are to be reminded by Marine Inspectors that the book may be prima facie evidence in a court of law and that entries must be made in accordance with 46 U.S.C. 11502 or they may not be admissible evidence of events aboard ship.
-

H. Deceased, Deserting, And Destitute Seamen. (2014)

1. Disposition Of Wages And Effects.
 - a. The authority for the disposition of the wages and effects of deceased seamen is contained in 46 U.S.C. Chapter 107. The authority for disposition of the wages and effects of deserting seamen is contained in 46 U.S.C. Chapter 115. There are no regulations written specifically addressing this subject. The instructions in this chapter are intended to establish a uniform procedure for their administration.
 - b. Certified extracts of the official logbook entry of a deceased or deserting seaman's wages and effects should be distributed to the following:
 - (1) Employer, vessel owner and vessel operating company;
 - (2) Applicable U.S. District Court or U.S. Consulate Officer;
 - (3) Commanding Officer, National Maritime Center (NMC-4); and
 - (4) With the personal effects of the deceased. The master or master's representative is responsible for delivery of the seaman's money, property and wages to a consular officer or to the U.S. District Court of the district in which the voyage begins or ends.
 - c. The responsibilities of obtaining certified copies of the logbook and sending them to the proper authorities used to be a duty of the shipping commissioner. The master should inform the local OCMI of the death and the OCMI shall obtain certified copies of the logbook and forward them to the authorities listed in b.(2) and (3) above.

PART C: SHIPMENT AND SERVICE**CHAPTER 1: SHIPMENT AND DISCHARGE OF SEAMEN**2. Deceased Seamen. (2017)

The provisions of 46 U.S.C. Chapter 107 apply to the handling of wages and effects of deceased seamen. These are applicable if the seaman had been employed in foreign or intercoastal trade. They do not apply if the seaman had been employed in coastwise trade, or in trade between the U.S. and Canada, the West Indies, or the Republic of Mexico. When 46 U.S.C. Chapter 107 does not apply, the master should turn the deceased seaman's wages and effects over to the shipping company who in turn should deliver them to the official responsible for handling the seaman's estate. In any case, the OCMI should notify the NMC per C1.H.1.b.(3) above.

3. Deserting Seamen. (2014)

Under 46 U.S.C. 11501, desertion by an "engaged" seaman shall be punished by forfeiture of earned wages, money or property left on board. Disposition of such forfeitures is controlled by 46 U.S.C. 11505. Deserters may be subject to enforcement action such as Suspension and Revocation proceedings, see MSM Volume V, Part C Chapter 4.B.

4. Destitute Seamen. (2014)

46 U.S.C. 10318(e) and 11104(a) make provision for assistance to ill, injured, or destitute U.S. seamen by the Department of State. The U.S. Department of State has detailed special instructions to consular officers in the Department of State Foreign Affairs Manual (FAM) Volume 7, Section 7 FAM 700-715.

FIGURE C2-1: Engineering Equivalents	C2-4
--------------------------------------	------

PART C: SHIPMENT AND SERVICE**CHAPTER 2: ENDORSEMENT EQUIVALENTS****A. Deck Officer Endorsements. (2014)**

Deck officer endorsements may be limited by route, tonnage, and grade level. Credentialed officers may find employment in positions that do not directly correlate with these limitations. The following discussions provide guidance on what is included and not included within the limitations placed on an endorsement.

1. Routes. (2014)

Deck officer endorsements, other than towing endorsements, may be issued for the following routes. The routes specified by 46 CFR 11.464, 11.465 and 11.466 for towing endorsements are slightly different but the same concepts apply. (See also Part B, Chapter 3.G of this Manual.)

- a. Oceans.
- b. Near Coastal.
- c. Great Lakes and Inland.
- d. Inland.
- e. Rivers.

The above routes constitute a hierarchy. An officer endorsed at one level may sail on any waters listed below it. For example, an endorsement for Great Lakes and Inland authorizes the holder to sail any river route.

Western Rivers is a unique route applied only to towing vessels. Towing vessel officers may not operate upon Western Rivers unless specifically endorsed for Western Rivers. Towing vessel officers endorsed for only Western Rivers, may not operate on Rivers, other than the Western Rivers. Neither route is subordinate to the other.

2. Tonnage. (2014)

A tonnage restriction applies to the tonnage level specified on the endorsement and to any other authorized service. For example, an officer endorsed as master - 500 GRT can sail as a mate but the tonnage limitation is still 500 GRT. In some cases the officer will hold endorsements with different tonnage limitations. An officer could be endorsed as mate - 500 GRT and master - 200 GRT. This mariner could be employed as a mate on a 250 GRT vessel but not as a master on the same vessel. Subject to any other restrictions, a national endorsement with only a GRT restriction is suitable for service on vessels (not otherwise subject to the provisions of STCW) where only a GT ITC is assigned. In this capacity, the GRT restriction may not be less than the assigned GT ITC of the vessel. See Part B, Chapter 3.B of this Manual for discussion on the Impact of International Standards, including the International Convention of Standards of Training, Certification And Watchkeeping For Seafarers (STCW) 1978, as amended, and International Convention on Tonnage Measurement of Ships, 1969 (ITC).

PART C: SHIPMENT AND SERVICE**CHAPTER 2: ENDORSEMENT EQUIVALENTS**3. Grade Level. (2014)

An officer endorsement as chief, second, or third mate on ocean or near coastal routes authorizes service as a mate where a specific grade level is not required. In many situations, the conditions of employment are different from those normally associated with the endorsed grade level. For example, a third mate - oceans may be employed as a mate - inland even though the operations of the vessel will probably be very different from those of an oceangoing vessel. The employer must ensure that the officer is familiar with the special requirements of the position and understands the duties and responsibilities of the position. The officer must comply with the regulations (46 CFR 15.405) to become familiar with each vessel's relevant characteristics. See also Part B, Chapter 3.D of this Manual.

4. Uninspected Fishing Industry Vessels. (2014)

An officer endorsement as master or mate of inspected vessels may serve as master or mate, respectively, on uninspected fishing industry vessels within the limitations of the credential.

5. Regulatory Equivalents. (2014)

Title 46 CFR Part 15, Subpart I, provides specific regulatory equivalencies for deck officer endorsements and guidance for uninspected passenger vessels and towing vessels. Information on the equivalencies for the assistance towing endorsement is contained in 46 CFR 11.482.

6. Officer Endorsements For Mobile Offshore Drilling Units (MODU). (2014)

- a. To serve as an Offshore Installation Manager (OIM), a mariner must be specifically endorsed as an OIM. There are five grades of Offshore Installation Manager (OIM) endorsements. An OIM Unrestricted endorsement authorizes service in any position where an OIM is required. The remaining four OIM grades are restricted to service on a specific type of MODU while the MODU is operating as stated on the endorsement. For example, an OIM of Bottom Bearing Units Underway may not serve as the OIM while the unit is on location. See 46 CFR 11.470 and 15.520.
- b. To serve as a Barge Supervisor (BS), a mariner must be specifically endorsed as a BS. To serve as a Ballast Control Operator (BCO), a mariner must be specifically endorsed as a BS or a BCO. See 46 CFR 11.472, 11.474, and 15.520.

7. Officer Endorsements For Offshore Supply Vessels (OSV). (2017)

As part of rulemaking that became effective on March 24, 2014 (78 FR 77795 [December 24, 2013]), national officer endorsements for Master OSV are issued either for less than 1,600 GRT/3,000 GT ITC or for a higher tonnage not to exceed 10,000 GRT/GT ITC. Endorsements for Mate (OSV) will be issued with tonnage authority as "Less Than 10,000 GRT/GT ITC." This higher tonnage authority will be added to existing Mate (OSV) endorsements when the mariner renews their credential. However, previously issued endorsements for Mate of OSVs for lesser tonnage will only be valid for their stated

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel

PART C: SHIPMENT AND SERVICE**CHAPTER 2: ENDORSEMENT EQUIVALENTS**

tonnage. In addition, mariners holding an endorsement as Master of OSVs of Less Than 1,600 GRT/3,000 GT ITC will be issued an endorsement for Mate OSV with a tonnage authority "Less Than 10,000 GRT/GT ITC." This Mate OSV endorsement will be added when the mariner renews their credential, or upon application from the mariner.

B. Engineer Officer Endorsements. (2014, 2017)

Engineer officer endorsements may be limited by propulsion power [horsepower (hp) or kilowatt (kW)], propulsion mode (see Chapter A12.D), route, grade, or type of vessel. Figure C2-1 shows the engineering equivalencies in a graphic format. This table must be interpreted by giving consideration to all limitations that may appear on an endorsement, e.g., a chief engineer of steam vessels of unlimited propulsion power cannot sail as an assistant engineer of any motor vessel; a motor endorsement is required.

NOTE: See NVIC 02-01 for guidance regarding Qualifications of Engineer Officers Serving on Seagoing Vessels with Gas Turbine Main Propulsion. If there is an area of conflict between Chapter A12.D and the NVIC, the guidance provided in NVIC 02-01 shall take precedence. (2017)

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
PART C: SHIPMENT AND SERVICE
CHAPTER 2: ENDORSEMENT EQUIVALENTS

Figure C2-1: Engineering Equivalents (2014, 2017)

The engineer officer endorsements in the left-hand column qualify for service in a subordinate capacity as indicated by the marked columns without additional, specific, endorsement. In all cases, limitations (horsepower, tonnage, waters, etc.) of the endorsement continue to apply. When serving on a vessel to which STCW applies, the appropriate STCW endorsement must also be held.

NOTES:

1. Limited to vessels of not more than 1600 GRT on Oceans, NC, GL; any GRT on inland waters.
2. Limited to vessels of not more than 1600 GRT on NC, or GL; any GRT on inland waters.
3. Limited to vessels of not more than 500 GRT.
4. See 46 CFR 15.915(a)(1).
5. The chief engineer (limited near-coastal) endorsement will be phased out and discontinued after March 24, 2019. All engineers endorsed as chief engineer (limited near-coastal) can be upgraded to chief engineer (limited) 1600 GRT without further sea service or testing requirements.

PART C: SHIPMENT AND SERVICE**CHAPTER 2: ENDORSEMENT EQUIVALENTS**

1. Propulsion Power. (2014)
A horsepower (hp) or kilowatt (kW) restriction applies to the propulsion power level specified on the endorsement and to any other service unless otherwise authorized. An officer endorsement for chief engineer -3000 hp (2300 kW) can sail as an assistant engineer, but the horsepower limitation is still 3000 hp (2300 kW). In some cases the officer may hold an endorsement with different horsepower limitations for different grades. For example, a mariner could be endorsed as chief engineer - 3000 hp (2300 kW) and assistant engineer - any hp (power rating). This mariner could be employed as an assistant on a vessel of any hp (power rating) but not as chief.
2. Grade Level. (2014)
An officer endorsement as first, second or third assistant engineer authorizes service as an assistant engineer where the grade level is not specified. See also Part B, Chapter 3.F of this Manual.
3. Designated Duty Engineer (DDE). (2014)
The grade of Designated Duty Engineer (DDE) was created to be the sole engineer on vessels of not more than 500 GRT with a periodically unattended engine room. However, current manning requirements do not require DDEs on any vessel, only chief and assistant engineers. A Designated Duty Engineer (DDE) may serve as a chief or assistant engineer within the limitations in 46 CFR 15.915 and the limitations on the credential. See also Part B, Chapter 3 of this Manual.
4. Regulatory Equivalents. (2014)
Title 46 CFR Part 15, Subpart H, provides specific regulatory equivalencies for engineer endorsements in 46 CFR 15.915. See also Part B, Chapter 3 of this Manual.
5. Uninspected Fishing Industry Vessels. (2014)
An officer endorsement as chief engineer or assistant engineer of inspected vessels may serve as chief engineer or assistant engineer, respectively, on uninspected fishing industry vessels within the limitations on the credential.
6. Officer Endorsements For Mobile Offshore Drilling Units (MODU). (2014)
Upper level engineer officer endorsements authorize service on Mobile Offshore Drilling Units (MODUs) without a specific MODU endorsement. The OCMI issuing the MODU's COI may authorize the substitution of chief or assistant engineer (MODU) for chief or assistant engineer, respectively, on self-propelled or propulsion-assisted surface units, except drillships. The OCMI may also authorize the substitution of assistant engineer (MODU) for assistant engineer on drillships. See 46 CFR 11.540 and 15.520.

PART C: SHIPMENT AND SERVICE**CHAPTER 2: ENDORSEMENT EQUIVALENTS****C. Deck Ratings. (2014)****1. Able Seamen. (2014)**

As provided for in 46 U.S.C. 7306–7311a, there are six classifications authorized for endorsement as able seaman (AB). The AB -Unlimited may sail as an AB on any vessel. An AB - Limited may sail in any AB capacity except AB - Unlimited. An AB - Special may sail as an AB in any capacity except AB - Limited and AB - Unlimited. All other AB ratings are limited to employment as an AB on the specific type of vessel authorized on the document. The AB - Sail is authorized to serve on sail training vessels only. See also Part B, Chapter 4.D of this Manual.

2. Seamen On MODUs. (2014)

Unlike the other AB ratings established pursuant to 46 U.S.C. 7306–7311a, AB – MOU (MODU) is not a rating authorized by statute or regulation. The AB – MOU (MODU) endorsements for ratings were issued to address a perceived deficit of seaman qualified for the unique requirements of serving onboard a MODU. However, it is likely that the Coast Guard will work to phase out this endorsement, providing transitional procedures that will allow those currently holding this rating to continue to serve aboard MODUs (see 78 FR 1625-AA16, 247 [December 24, 2013]). In the interim, there are credentials endorsed as AB – MOU (MODU) and Lifeboatman – MOU (MODU). Mariners with these ratings are authorized to serve on mobile offshore drilling units only.

3. Tankermen. (2014)

See 46 CFR Part 13 and 15.860.

4. Lifeboatmen. (2014)

After 24 March 2014, any MMC endorsed as AB will also be endorsed as lifeboatman or lifeboatman-limited, as appropriate (46 CFR 12.401(d)(2)). Every person assigned duties as a lifeboatman must hold a credential attesting to such proficiency. Persons serving on vessels subject to the STCW Convention must also hold an STCW endorsement in proficiency in survival craft and rescue boats other than fast rescue boats (PSC). Every person assigned duties onboard a vessel that is not required to carry lifeboats and is required to employ a lifeboatman must hold an endorsement as either lifeboatman or lifeboatman-limited. See also Part B, Chapter 4.D of this Manual.

PART C: SHIPMENT AND SERVICE**CHAPTER 2: ENDORSEMENT EQUIVALENTS****D. Engine Ratings. (2014)**

There are five distinct Qualified Member of the Engine Department (QMED) ratings, which can be endorsed separately. The ratings are; Fireman/Watertender, Oiler, Junior Engineer, Electrician/Refrigerating Engineer, and Pumpman/Machinist. They do not authorize service in any other rating. For example, a mariner with an endorsement as "Junior Engineer" may not serve as a pumpman for purposes of meeting the manning requirements. However, the COI of some vessels may authorize one rating to be substituted for another. A mariner may obtain all five QMED ratings and be issued an endorsement authorizing service as a QMED - Any Rating. A mariner with this endorsement may fill any engineering rating (46 CFR 12.501(b)).

NOTE: In accordance with 46 CFR 12.501, the Coast Guard will no longer issue original endorsements for deck engineer, deck/engine mechanic, or engineman, or individual endorsements for refrigerating engineer, machinist, electrician, and pumpman. However, a mariner who holds any of these endorsements may continue to renew them as long as he or she is otherwise qualified. (2014)

E. International Convention On Standards Of Training, Certification And Watchkeeping For Seafarers (STCW) 1978, as amended. (2014)

1. For Credentialed Officers see Part B, Chapter 3.B.2 of this Manual.
2. For Credentialed Ratings see Part B, Chapter 4.B.1 of this Manual.

F. Trade Restricted Endorsements. (2014, 2017)

A trade restriction is valid only for the vessel type specified, within the limitations of the endorsement. For example, a mariner endorsed as chief mate (OSV) can only be employed as chief mate on offshore supply vessels. When a vessel is inspected under more than one Subchapter (i.e., Multi-Service [Certificated]), for example a vessel inspected as both an offshore supply vessel and a miscellaneous cargo vessel, mariners must hold credentials appropriate to the trade the vessel is operating in at the time (see also Chapter B2.V) (46 CFR 15.401).

¹ For completion and use in accordance with the procedures established by the competent authority in compliance with the relevant requirements of the Seafarers' Hours of Work and the Manning of Ships Convention, 1996 (Convention No. 180).
² Additional calculations or verifications may be necessary to ensure compliance with the relevant requirements of the Seafarers' Hours of Work and the Manning of Ships Convention, 1996 (Convention No. 180) and the International Convention on Standards of Training, Certification and Watchkeeping, 1978, as amended (STCW Convention).

MINIMUM SAFE MANNING DOCUMENT

Issued under the provision of regulation V/14 of the
INTERNATIONAL CONVENTION FOR THE SAFETY OF LIFE AT SEA, 1974, as amended
under the authority of the Government of **THE UNITED STATES OF AMERICA**
by **THE UNITED STATES COAST GUARD**

Vessel Name: *(From Certificate of Documentation)* IMO Number: *(If Not Provided Indicate U.S. O.N.)*
Distinctive numbers or letters: *(Call Sign)* Port of Registry: *(Hailing Port)*
Gross Tonnage: (GRT) (GT ITC) Main Propulsion Power: *(Aggregate)(hp) / (Aggregate)(kW)*
Type of Vessel: *(Primary Service)* Periodically Unattended Machinery Space: *(YES or NO)*
Trading Area: *(e.g. Oceans/Unlimited)* Operating Company:

In accordance with the principles and guidelines set out in Annex 1 and 2 of IMO Resolution A.1047(27), the vessel named in this document is considered to be safely manned if, when it proceeds to sea, it carries not less than the number and grades/capacities of personnel specified in the table below. When on an 'international voyage', this vessel must be manned with the following licensed and unlicensed personnel, included in which there must be two (2) certificated lifeboatmen [Note: Ref. 46 CFR 15.845], three (3) GMDSS Radio Operators [Note: Ref. Para B3.L], and zero (0) certificated tankerman [Note: Ref. 46 CFR 15.860]:

U.S. License/Rating	STCW Grade/Capacity	Certificate (STCW regulation)	Number of Persons
Master [Note: Ref. Para B3.C & G]	Master on vessels of 500 to 3,000 GT ITC or more	II/2 [Note: Ref. Para B3.B.2.a]	1
Licensed Mate [Note: Ref. Para B3.D & G]	Officer in charge of a navigational watch of vessels over 500 GT ITC	II/1 [Note: Ref. Para B3.B.2.a]	2 ^a
Able Seaman [Note: Ref. Para B4.C & D]	Rating forming part of navigational watch	II/4 [Note: Ref. Para B4.B.1.a]	3 ^a
Chief Engineer (Motor/Unlimited hp) [Note: Ref. Para B3.E]	Chief engineering officer, main propulsion machinery over 3,000 kW	III/2 [Note: Ref. Para B3.B.2.b]	1
Licensed Engineer (Motor/Unlimited hp) [Note: Ref. Para B3.F]	Officer in charge of an engineering watch of vessels over 750kW	III/1 [Note: Ref. Para B3.B.2.b]	2 ^a
Qualified Member of the Engine Department [Note: Ref. Para B4.C & E]	Rating forming part of an engineering watch	III/4 [Note: Ref. Para B4.B.1.b]	---

Special requirements and conditions:

*In accordance with U.S. law, when on a voyage of less than 600 miles, manning may be reduced by one (1) Licensed Mate, one (1) GMDSS Radio Operator, one (1) Licensed Engineer, and one (1) Able Seaman. [Note: Ref. Para B5.A.4.b]

Up to one (1) Ordinary Seamen with an STCW 95 endorsement attesting to "Rating forming part of a navigational watch" may be substituted for one (1) Able Seaman. [Note: Ref. Para B4.B.1.a.(3) & B4.D.1]

[Note: Ref. Para B3.B.2.d.(2)(b) for special requirements and conditions pertaining to the Canadian MPR]

In addition, the vessel may carry xxxx (x) passengers, xxxx (x) other persons in crew, xxxx (x) persons in addition to the crew, and no others. Total persons allowed: xxxxx (xx).

Vessel Operator Address Block

Attn:

Vessel Operator Address

Vessel Operator Address

Subj: SAFE MANNING LETTER (SML) FOR VESSEL NAME,

IMO Number: (If Not Provided Indicate U.S. O.N.)

Dear Port State Control Official:

We are providing this letter as a statement of fact for the referenced vessel regarding U.S. requirements for operation in oceans unrestricted service on foreign/international voyages. This commercial vessel was built / keel laid date^[1] on _____, is _____ GRT, _____ GT ITC, (Aggregate) hp, and (Aggregate) kW. The vessel has / has not^[1] undergone any major modifications.

The International Convention on Tonnage Measurement of Ships, 1969, came fully into force on 18 July 1994. Under the provisions of this Convention, as supplemented by International Maritime Organization (IMO) Interim Schemes (Resolutions A.494 (XII) and A.541(13)), a vessel meeting certain criteria may retain the gross tonnage assigned under the Flag State's national tonnage system for the purpose of applying requirements of specific international conventions.²

The U.S. Coast Guard acknowledges that the above mentioned vessel is currently of United States registry and qualifies for retaining national gross tonnage under the provisions of the International Convention on Tonnage Measurement of Ships, 1969, as supplemented by IMO Interim Schemes. The national gross tonnage assigned to this vessel under the United States Regulatory Measurement System is _____ GRT.^[2]

Based on its size and current service the vessel is not required to be inspected and certificated by the U.S. Coast Guard under the laws of the United States, nor does / do^[1] SOLAS and MARPOL^[3] require certification, including issuance of a Safe Manning Document.

To assist Port State Authorities and others that may have an interest in the operations of the subject vessel the below information is provided regarding what requirements do apply to the vessel.

The vessel must comply fully with the Flag State requirements for an uninspected vessel of this tonnage and service. Those requirements are contained in Title 46 Code of U.S. Federal

¹ Delete as appropriate.

² Delete if interim tonnage scheme does not apply. See NVIC 11-93 (series)

³ Delete as appropriate for vessels ≥ 400 GT ITC

ANNEX-4

CH-2

Regulations, Subchapter C (Part 24-26). Although no inspection certificate is required to be issued attesting to compliance, the U. S. Coast Guard does have authority to do boarding's of the vessel for the purpose of verification. A properly displayed and valid Uninspected Towing Vessel decal shows this vessel has voluntarily been examined and meets current applicable Flag State requirements.⁴ The vessel may engage in unrestricted international voyages provided that it is properly manned with credentialed crew as noted below:

1 Master (Oceans / Near Coastal^[4]) of not more than _____ GRT, _____ GT ITC.

1 Mate, OICNW (Oceans / Near Coastal^[4]) of not more than _____ GRT, _____ GT ITC.

1 Chief Engineer, of _____ hp, _____ kW.*

1 Assistant Engineer, of _____ hp, _____ kW.*

2 Able-bodied Seaman (without STCW endorsements)

*A Designated Duty Engineer (Unlimited / Limited^[5]) may be substituted for a Chief Engineer and/or an Assistant Engineer on vessels below 500 GRT.

Periodically Unattended Machinery Space^[6]: YES / NO^[4]

STCW requires any rating forming part of any watch in a manned engine room or designated to perform duties in a periodically unmanned engine room powered by main propulsion machinery of 750 kW or more to meet certification requirements. If the vessel employs a crewmember in this capacity that crewmember should have an MMC with appropriate STCW endorsements. Deck ratings are not required to meet STCW if aboard a vessel of less than 500 GT ITC.

The vessel should maintain records indicating the work and rest hours of all credentialed watch standers.

We respectfully request that Port State Officials accept this letter as evidence of the Flag State's requirements for the vessel to operate in unrestricted service. Questions concerning this letter may be directed to address and/or e-mail listed at the top of this letter.

Sincerely,

XXXXXXXXXXXXXXXXXXXX

Insert rank, U. S. Coast Guard
Officer in Charge, Marine Inspection

⁴ Delete as appropriate.

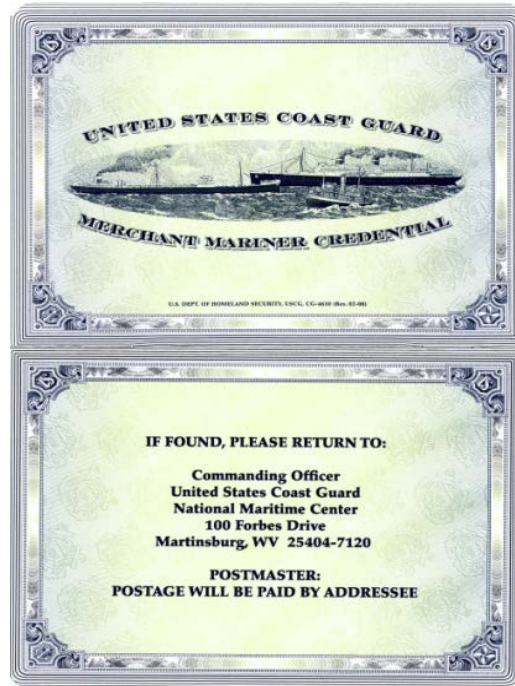

⁵ Delete as appropriate. If limited, specify hp/kW limitation.

⁶ PUMS Endorsement only necessary for voyages to Canada.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
ANNEX

Sample: Consolidated Merchant Mariner Credential (MMC). (2014, 2017)

The merchant mariner credential or MMC combines the individual merchant mariner's document, license, and certificate of registry enumerated in 46 U.S.C. Subtitle II Part E as well as the STCW endorsement into a single credential that serves as the mariner's qualification document, certificate of identification, and certificate of service. The MMC is a seafarers' identity document for the purpose of the Seafarer's Identity Documents Convention (revised), 2003, of the International Labor Organization. The MMC has the look and feel of a passport, however, it does NOT substitute for a passport. The MMC retains much of the traditional artwork found on the current credentials. The document is resistant to chemical solvents, oxidants, acids and alkali. Updated MMC booklets were issued starting March 22, 2016. The new MMC booklet features an improved layout with graphic images of historic lighthouses, the Eads Bridge, the Merchant marine Emblem, and a first-order Fresnel lens. Additionally, the cover of the MMC has been stiffened for greater durability. All currently active credentials will remain valid until their printed expiration dates. [Due to scanning constraints, the color depicted here is not a true color match.]

New MMC Booklet (March 22, 2016).

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
ANNEX

Personal Data. (2014)

Personal information on the data page adheres to the requirements of ICAO 9303, Machine Readable Travel Documents, and includes all data elements required by the Seafarers' Identity Documents Convention (Revised) (ILO-185). The MMC is not valid without signature of the holder. Mariners should sign the document on receipt.

NOTE: MMCs issued after August 3, 2015 were produced using an improved laminate, which enhances print quality and security features. The new laminate contains the Department of Homeland Security, Coast Guard, and the Merchant Marine seals as well as other features (example image not available for inclusion). Laminate is used on the personal data page and all subsequent printed pages ending with the issuing official's signature. There were no changes made in the way endorsement labels are issued and applied to MMCs. MMCs issued prior to August 3, 2015 will remain valid until the printed expiration date. Questions regarding the authenticity of a MMC should be directed to the NMC. (2017)

ANNEX

Credential Data (Con't).

This page contains the Domestic (Officer and Rating) Endorsements. Domestic Officer and Rating Endorsements data are printed in terms of Capacities and Limitations much like the current STCW Certificates.

The lawful holder of this Credential,	
JOHN THE MERCHANTMARINER, III	
as endorsed below, is entitled under Title 46 (Shipping) U.S. Code to serve in the capacity or capacities specified (Domestic Only), subject to any limitations indicated.	
<u>CAPACITY</u>	<u>LIMITATIONS APPLYING (IF ANY)</u>
Master	Limited to Inland Waters
First Class Pilot	Limited to Inland Waters of Southeast AK from Dixon entrance to Yakutat Bay, excluding Klawock Inlet, West Coast Prince of Wales, South Coast Prince of Wales, Sumner Strait West, Gastineau Channel, and Glacier Bay; also first class pilot of any gross tons upon the waters of Kachemak Bay/Homer, Seldovia Bay/Seldovia, Seal Rocks to Bligh Island and Port of Valdez; also first class pilot of steam or motor vessels of any gross tons upon Washington main ship channels between Point Roberts and Vita Rocks and the terminal port of Bellingham.
Ref Num 2500020	Serial Num 000333

<u>CAPACITY</u>	<u>LIMITATIONS APPLYING (IF ANY)</u>
Any Unlic Rating in Deck Dept.	Except Able Seaman
Lifeboatman	Valid for use on Fast Rescue Boats
Wiper	
Stewards department (FH)	
Issue Date: 01-OCT-2008	Expiration Date: 01-OCT-2013
Issue Port: Martinsburg, WV	
D.C. STALFORD, CAPT, USCG	
Ref Num 2500020	Serial Num 000333

NOTE: In accordance with 46 U.S.C. 7110, each holder of a license issued under Part E shall display, within 48 hours after employment on a vessel for which that license is required, the license in a conspicuous place on the vessel. Mariners holding a consolidated MMC should display the officer endorsement page of the MMC, which is equivalent to the previous officer license. As a security measure, mariners have been advised not to post their credentials while the vessel is visiting foreign ports. (2014)

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
ANNEX

Endorsement Label. (2014, 2017)

When a mariner applies for an endorsement or raise in grade, the NMC will produce a label to be added to the MMC. The label will be mailed to the mariner with instructions for placement in the credential booklet. Once the label has been adhered to the booklet, it cannot be removed without damaging the document. When a mariner is provided a label to be added to the MMC, it will contain both the mariner's Coast Guard reference number, and the serial number of the MMC it is to be inserted into. The numbers for the label must match those in the MMC it was added to.

Merchant Mariner Credential (MMC) Endorsement

Read all of the information below before inserting label(s) in your MMC

- This label is the endorsement to your MMC, however, it is not valid unless properly placed within your MMC.
- Please review the information contained on the endorsement label for accuracy, before placing in credential booklet. If, after reviewing the label, you have questions, concerns or need additional information, DO NOT insert in booklet. Instead, please call: (888)427-5662 or send an e-mail to: iasknmc@uscg.mil
- The instructions below must be followed carefully to ensure that this label becomes a permanent part of your MMC. Labels cannot be repositioned and you should not make any attempt to remove it once it is affixed to your MMC.
- If more than one label has been enclosed you must place them in the order indicated by the sequence number next to label beginning with 1.

Step 1: Open the MMC booklet to the first blank page. It may be the front or back of a page.

Step 2: Place the opened credential on a hard surface with the page numbers at the bottom (toward you).

Step 3: Carefully remove label from the carrier sheet.

Step 4: Center the label within the page border, with the label inventory number at the lower right corner. Do not obstruct the page number.

Step 5: Press firmly onto the credential page.

- If you make a mistake while inserting this endorsement call (888) 427-5662 or send an e-mail to: iasknmc@uscg.mil to request further instruction.

ANNEX

Sample: Medical Certificate. (2014)

The medical certificate is a document issued by the Coast Guard under 46 CFR part 10, subpart C that serves as proof that the seafarer meets the medical and physical standards for merchant mariners. Because of differing legal requirements, each medical certificate will carry three expiration dates. One will be the expiration date for STCW (see 46 CFR 10.301(b)(1)), a second expiration date will be for First Class Pilotage under 46 CFR 15.812 (see 46 CFR 10.301(b)(2)), and the third will be the expiration date for all other purposes (see 46 CFR 10.301(b)(3)). A valid medical certificate must be carried when serving under the authority of a MMC [46 CFR 15.401(d); 15.403(a); 15.403(b)(1)]. The medical certificate will note any operational limitations on the mariner's authority to serve. The mariner is responsible for complying with any operational limitations or restrictions on the medical certificate.

ANNEX**NOTE: Medical Certificate, Transitional Provisions. (2014)**

Issuance of medical certificates to mariners holding only national endorsements will be phased-in over a five-year period. Beginning January 24, 2014, mariners with only national endorsements will be issued a medical certificate during their first credential transaction that requires a medical review. By January 24, 2019, all mariners holding only national endorsements should have a valid medical certificate. In most cases, mariners who have a credential with only national endorsements issued before January 24, 2014 won't have a separate medical certificate until their next credential transaction that requires a medical review. This can be verified by checking the issuance date on the MMC Personal Data page.

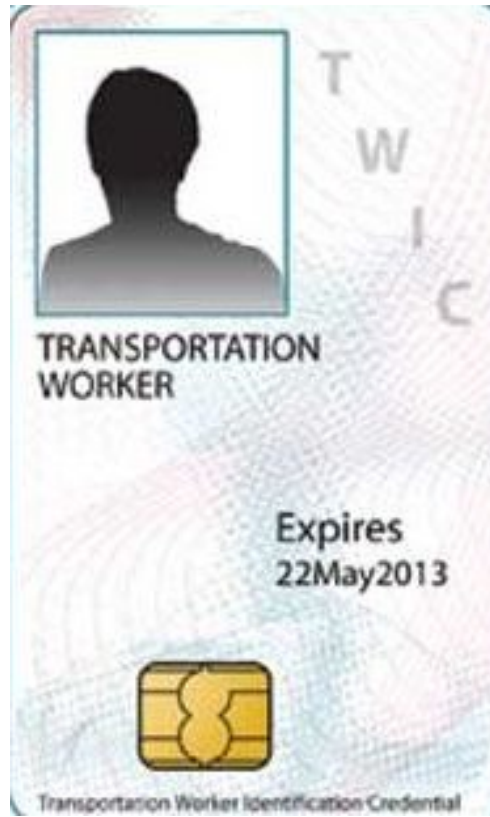

First Class Pilots and those acting as pilot under the provisions of 15.812 are required to have an annual physical examination which meets the requirements of 46 CFR Part 10, Subpart C; however, they are only issued medical certificates every 2 years. The issuance of medical certificates to First Class Pilots will be phased-in over an 18 month period. Beginning January 24, 2014, First Class Pilots will be issued a medical certificate during their first credential transaction which requires a medical review OR at their first required submission of physical examination in accordance with 46 CFR 11.709(b) whichever is earlier. After July 24, 2015, all Pilots should have a valid medical certificate, however those national mariners holding but not acting under the authority of the pilot endorsement need only meet the 5 year phase-in allowance of the previous paragraph.

Full implementation of the medical certificate requirements is based on the following schedule;

STCW:	Beginning on or about 1 January 2014, mariners with current STCW endorsements will be issued a medical certificate. This process should be completed by 1 January 2015. The issuance of STCW endorsements subsequent to that date will include a medical certificate. Once issued, a valid medical certificate must be carried when serving under the authority of a MMC. All persons employed or engaged onboard vessels to which STCW applies must hold a valid medical certificate by 1 January 2017.
National endorsement only:	Once issued, a valid medical certificate must be carried when serving under the authority of a MMC. All mariners serving under their national endorsement should have a medical certificate no later than January 24, 2019.
First Class Pilot (service):	Once issued, a valid medical certificate must be carried when serving under the authority of their pilotage endorsement. All mariners serving under the authority of a pilotage endorsement should have a medical certificate by July 24, 2015.

ANNEX

Common COI/SMD Sample Endorsements. (2014, 2017)
(Noninclusive.)

Periodically unattended or minimally attended machinery space. [MSM Vol. III, Part B, Chapter 6] (2014)

APPROVED FOR [PERIODICALLY UNATTENDED*] OR [MINIMALLY ATTENDED*] MACHINERY SPACE OPERATION. THIS APPROVAL AND THE MINIMUM MANNING LEVEL SPECIFIED ON THIS CERTIFICATE OF INSPECTION ARE CONTINGENT UPON THE PROPER OPERATION OF THE AUTOMATED CONTROL/AUTOMATED MONITORING/AUTOMATED MACHINERY MANAGEMENT SYSTEM(S). ANY MAJOR ALTERATION OR FAILURE MUST BE REPORTED IMMEDIATELY TO THE NEAREST OCMI.

*Delete as appropriate

Unattended machinery space, Subchapter L and M only. [500 GT ITC and above, endorsement aligns with SOLAS II-1/46.3 and IMO Resolution A.1047(27) for international voyages] (2014, 2017)

[APPROVED FOR PERIODICALLY UNATTENDED MACHINERY SPACE OPERATION. THIS APPROVAL AND*] THE SPECIFIED MANNING LEVEL IS CONTINGENT UPON THE PROPER OPERATION OF THE ENGINEERING AUTOMATED CONTROL/MONITORING SYSTEMS. ANY MAJOR ALTERATION OR ESSENTIAL COMPONENT FAILURE MUST BE REPORTED IMMEDIATELY TO THE COGNIZANT OCMI.

*Delete as appropriate

Unattended machinery space, Subchapter L and M only. [Less than 500 GT ITC or for domestic voyages] (2014, 2017)

THE SPECIFIED MANNING LEVEL IS CONTINGENT UPON THE PROPER OPERATION OF THE ENGINEERING AUTOMATED CONTROL/MONITORING SYSTEMS. ANY MAJOR ALTERATION OR ESSENTIAL COMPONENT FAILURE MUST BE REPORTED IMMEDIATELY TO THE COGNIZANT OCMI.

Foreign near-coastal voyages. [MSM Vol. III, Part B, Chapter 3] (2014)

VESSEL LIMITED TO A NEAR COASTAL ROUTE WHEN OFFICERS HOLD NEAR COASTAL ENDORSEMENTS AND STCW CERTIFICATES. A NEAR COASTAL ROUTE IS THE LESSER OF 200 NM FROM SHORE OR THE DISTANCE AS DEFINED BY THE LOCAL COUNTRY WHERE THE VESSEL IS OPERATING.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
ANNEX

Canadian Marine Personnel Regulations. [MSM Vol. III, Part B, Chapter 3] (2014)

CHIEF ENGINEER, ASSISTANT ENGINEERS, OR DESIGNATED DUTY ENGINEERS NOT REQUIRED OTHER THAN ON VOYAGES TO CANADA IN ACCORDANCE WITH DIVISION 4 OF THE CANADIAN MARINE PERSONNEL REGULATIONS.

Offshore supply vessels (OSV) and Mobile Offshore Drilling Units (MODU) foreign crew waiver. [MSM Vol. III, Part B, Chapter 1] (2014)

WHEN OPERATING FROM A FOREIGN PORT, NOT ON U.S. WATERS, FOREIGN NATIONALS WITH VALID STCW CERTIFICATES, ISSUED BY A COUNTRY DEEMED BY THE IMO TO BE GIVING FULL AND COMPLETE EFFECT TO THE STCW CONVENTION, AS AMENDED, MAY SERVE AS AN OFFICER WITHOUT ADDITIONAL ENDORSEMENT, PROVIDED THE MASTER ADHERES TO TITLE 46, CODE OF FEDERAL REGULATIONS (CFR) 15.720(D). THE MASTER OF THE VESSEL MUST BE A U.S. CITIZEN, DULY CERTIFICATED BY THE UNITED STATES.

THIS ENDORSEMENT ESTABLISHES CONFORMITY WITH THE SAFE MANNING REQUIREMENTS OF THE UNITED STATES PERTAINING TO 46 CFR 15.720(B) IN FULL CONSIDERATION OF THE GUIDING PRINCIPLES FOR PORT STATE CONTROL (APPENDIX 11, IMO RESOLUTION 1052(27), AS REVISED).

Multi-Service (Certificated) Offshore Supply Vessels. [MSM Vol. III, Part B, Chapter 2] (2014)

VESSEL IS MULTI-CERTIFICATED AS FREIGHT VESSEL, OFFSHORE SUPPLY VESSEL AND INDUSTRIAL VESSEL. VESSEL MUST CONFORM AT ALL TIMES TO THE MOST STRINGENT DESIGN AND EQUIPMENT STANDARDS OF THE APPLICABLE RULES AND REGULATIONS, INCLUDING SOLAS, REGARDLESS OF WHICH SERVICE THE VESSEL IS IN. VARIATIONS FROM STANDARD OPERATING DETAILS AND MANNING ARE DEPICTED BELOW BASED ON SERVICE THAT THE VESSEL IS ACTUALLY ENGAGED IN. CHANGES IN SERVICE SHALL BE LOGGED IN THE VESSEL'S OFFICIAL LOG BOOK.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
ANNEX

Permissive crewing. [MSM Vol. II, Section A, Chapter 3] (2014)

Where a vessel owner/operator voluntarily elects to crew a barge not otherwise required to be crewed, the vessel's Route Permitted and Conditions of Operation section of the COI should be endorsed:

****PERMISSIVELY MANNED****

PERMISSIVE MANNING AUTHORIZED PROVIDED RESTRICTIONS ON THE CURRENT LOAD LINE CERTIFICATE ARE MET. THE VESSEL MAY CARRY [##] PERSONS AS MAINTENANCE PERSONS WITH NO DUTIES CONNECTED WITH THE NAVIGATION OF THE VESSEL.

On seagoing barges over 100 GRT, the endorsement should include the statement:

ALL MAINTENANCE PERSONS MUST POSSESS MERCHANT MARINER CERTIFICATES, AND A MINIMUM OF 75 PERCENT OF THOSE PERSONS ABOARD MUST BE U.S. CITIZENS.

This endorsement may be further modified to limit the route on which personnel may be aboard based upon load line, lifesaving equipment, or other relevant factors.

Specially Trained Ordinary Seamen (STCW). [MSM Vol. III, Part B, Chapter 4] (2014)

UP TO TWO ORDINARY SEAMEN WITH A STCW CERTIFICATE ENDORSED FOR REGULATION II/4 'RATING FORMING PART OF A NAVIGATION WATCH' MAY BE SUBSTITUTED FOR TWO ABLE SEAMEN WITHOUT FURTHER ENDORSEMENT AS ABLE SEAFARER-DECK II/5.

Specially Trained Ordinary Seamen (Non-STCW). [MSM Vol. III, Part B, Chapters 2, 4, 6] (2014, 2017)

UP TO TWO ORDINARY SEAMEN MAY BE SUBSTITUTED FOR TWO ABLE SEAMEN. UNLICENSED SEAMEN PERFORMING NAVIGATIONAL WATCH KEEPING DUTIES MUST POSSESS MERCHANT MARINERS CREDENTIALS ENDORSED AS ABLE SEAMAN OR ORDINARY SEAMAN WITH A LETTER OF QUALIFICATION AND SPECIAL TRAINING AS PROVIDED IN NAVIGATION INSPECTION CIRCULAR 3-83.

ANNEX**Deck and Engine Maintenance-Person Endorsements.** [MSM Vol. III, Part B, Chapter 4] (2014)

ENGINE MAINTENANCE-PERSONS MUST EACH HOLD A QMED ENDORSEMENT AS JUNIOR ENGINEER, DECK ENGINE MECHANIC, OILER, OR ENGINEMAN AND AN STCW ENDORSEMENT ATTESTING TO 'RATING FORMING PART OF AN ENGINEERING WATCH'. WHEN CARRYING REFRIGERATED UNITS, ONE OF THE TWO ENGINE MAINTENANCE PERSONS MUST HOLD AN ENDORSEMENT AS A REFRIGERATION ENGINEER OR AS AN ELECTRICIAN.

THREE OF SIX MAINTENANCE-PERSONNEL SHALL HOLD QUALIFIED MEMBER ENGINE DEPARTMENT RATINGS WITH ENDORSEMENTS AS EITHER JUNIOR ENGINEERS OR OILERS. THE OTHER THREE MAINTENANCE-PERSONNEL SHALL HOLD ABLE SEAMEN ENDORSEMENTS.

Maintenance Department Endorsement. [MSM Vol. III, Part B, Chapter 4] (2014, 2017)

THE ABOVE MANNING IS CONTINGENT UPON THE UTILIZATION OF A MAINTENANCE DEPARTMENT AS INDICATED IN THE VESSEL'S OPERATING MANUAL. ANY SUBSTANTIAL CHANGE IN THE OPERATION OF THIS DEPARTMENT MUST, PRIOR TO IMPLEMENTATION, BE REPORTED TO THE OCM I WHO ISSUED THE VESSEL'S CERTIFICATE OF INSPECTION.

AT LEAST THREE OF THE REQUIRED MAINTENANCE-PERSONS MUST HOLD ENDORSEMENTS AS ABLE SEAMEN, EXCEPT THAT UP TO TWO OF THESE MAY BE QUALIFIED AS SPECIALLY TRAINED ORDINARY SEAMEN IN LIEU OF HOLDING ABLE SEAMAN ENDORSEMENTS. THREE MAINTENANCE-PERSONS MUST EACH HOLD A QMED ENDORSEMENT AS JUNIOR ENGINEER, DECK ENGINE MECHANIC, OILER, OR ENGINEMAN.

Small Passenger Vessels and Passenger-Carrying Barges. [MSM Vol. III, Part B, Chapter 2] (2014)

IF THE VESSEL IS AWAY FROM THE DOCK, OR PASSENGERS ARE ON BOARD OR HAVE ACCESS TO THE VESSEL FOR A PERIOD EXCEEDING 12 HOURS IN A 24 HOUR PERIOD AN ALTERNATE CREW SHALL BE PROVIDED.

Oil Spill Response Barges. [MSM Vol. III, Part B, Chapter 2] (2014)

WHEN TRANSFERRING RECOVERED OILY LIQUIDS OR OIL TO OR FROM ANOTHER VESSEL OR FACILITY, A TANKERMAN-PERSON-IN-CHARGE SHALL BE PROVIDED.

USCG Marine Safety Manual, Vol. III: Marine Industry Personnel
ANNEX

Towing Vessel Worksite Exclusion. [MSM Vol. III, Part B, Chapter 7] (2017)

WHILE ENGAGED EXCLUSIVELY WITHIN AN OCMI SPECIFIED WORKSITE AS A WORKBOAT, A TOWING VESSEL INSPECTED UNDER SUBCHAPTER M MAY BE OPERATED IN ACCORDANCE WITH MSM Vol. III, Part B, Chapter 7.B.2.

Conditionally Occupied Barge. [MSM Vol. III, Part B, Chapter 2 & CG-CVC Policy Letter 16-04] (2017)

All ATB Barges

WHILE OPERATING BEYOND THE BOUNDARY LINE, OR ON THE GREAT LAKES, THIS ATB BARGE MAY BE CONDITIONALLY OCCUPIED BY UP TO (SPECIFY A #) PERSONS.

WHENEVER PERSONNEL ARE CONDITIONALLY OCCUPYING THE ATB BARGE, A PROPERLY CREDENTIALLED CREW MEMBER HAVING A LIFEBOATMAN OR LIFEBOATMAN/LIMITED ENDORSEMENT SHOULD BE PRESENT ON THE BARGE.

Additional for ATB Tank Barges

WHENEVER PERSONNEL ARE CONDITIONALLY OCCUPYING THE ATB TANK BARGE TO OPERATE BARGE MACHINERY RELATED TO THE CARGO OR BALLAST WATER, AT LEAST ONE TANKERMAN-PIC, TANKERMAN-PIC (BARGE), OR RESTRICTED TANKERMAN-PIC SHOULD BE PRESENT ON BOARD THE BARGE.

****DO NOT USE. NO LONGER AUTHORIZED FOR USE.****

International Convention On Tonnage Measurement Of Ships, 1969 (ITC). [MSM Vol. III, Part B, Chapter 3] (2014)

ALL LICENSED INDIVIDUALS MUST HOLD LICENSES AUTHORIZING SERVICE ON VESSELS OF A TONNAGE AT LEAST EQUAL TO THE VESSEL'S U.S. REGULATORY TONNAGE AS INDICATED ON THIS CERTIFICATE OF INSPECTION AS PROVIDED FOR IN IMO RESOLUTION A.540(XIII).

****DO NOT USE. NO LONGER AUTHORIZED FOR USE.****

Suggested Template: Minimum Safe Manning Proposal

To Supplement the Application for Inspection of U.S. Vessel [CG-3752/3752A]

(Rev. 06-17)

Vessel Name:

IMO#/O.N./CG#:

This suggested template may be used to prepare and submit a minimum safe manning proposal as outlined in Marine Safety Manual Volume III, Sections B1.C - F. *It is not a required or OMB controlled form.* The manning requirements for a particular vessel are determined by the Officer in Charge, Marine Inspection (OCMI) after consideration of the applicable laws, regulations, and all other factors involved, such as: emergency situations, size and type of vessel, installed equipment, proposed routes of operation including frequency of port calls, cargo carried, type of service in which employed, degree of automation, use of labor saving devices, and the organizational structure of the vessel. Pursuant to Title 46, Code of Federal Regulations (CFR) 15.501(b), this template may be used to provide the necessary information. In preparing the minimum safe manning proposal, it is recommended that the following relevant documents be referenced:

- 46 U.S.C Chapter Part F – Manning of Vessels
- 46 CFR Chapter I, Subchapter B – Merchant Marine Officers and Seamen
- Marine Safety Manual Volume II: Materiel Inspection
- Marine Safety Manual Volume III: Marine Industry Personnel
- International Convention for the Safety of Life at Sea (SOLAS), 1974, as amended
- International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW), 1978, as amended
- Principles of Minimum Safe Manning, IMO Resolution A.1047(27), as amended

Title 46 CFR 15.505 requires that all requests for changes in manning be made to the OCMI who last issued the Certificate of Inspection (COI)¹, unless the request is made in conjunction with an inspection for certification, in which case the request should be addressed to the OCMI conducting the inspection. Complete all applicable shaded areas for a single vessel. This template is not all-inclusive and may be modified as necessary. It is recommended that a copy be retained by the Company.

Mission Management System (MMS) Work Instruction

ASSIGNMENT OF U.S. VESSEL MANNING

OBJECTIVE:

The objective of this work instruction is to provide a uniform procedure for the assignment of U.S. vessel manning in accordance with Sections **B1.C - F** of Ref. (a), which can be incorporated into a field-level Mission Management System (MMS). This instruction is not intended to provide detailed instruction on how to use the Marine Information for Safety and Law Enforcement (MISLE).

GOALS AND PURPOSE:

This work instruction details the procedure for the assignment of manning for U.S. vessels, including the administrative processing of associated documentation in accordance with Ref. (a).

NOTE 1: For the purposes of this work instruction, the generic use of the term “safe manning documentation” refers to Certificate of Inspection (COI), Safe Manning Document (SMD) and Safe Manning Letter (SML) as applicable.

BACKGROUND:

Under 33 CFR 1.01-20, the OCMI is responsible for the enforcement of vessel inspection, navigation, and seamen's laws within a specific zone. In this capacity, the OCMI is responsible for establishing manning levels for various types of vessels. The Certificate of Inspection (COI), Form CG-841, states the minimum number of credentialed officers and crewmembers necessary for the safe operation of inspected vessels, as required by 46 U.S.C. 8101 and 46 CFR 15.501. Also, many uninspected U.S. merchant vessels are subject to the manning requirements of 46 U.S.C. 8103, 8104, 8304, 8701-8703, 8903 and 8904. The International Convention for the Safety of Life at Sea (SOLAS), Chapter V, Regulation 14 requires each vessel to which SOLAS Chapter I applies to be issued a "Safe Manning Document."

AUTHORITY:

The general regulations for manning of vessels are contained in 46 CFR, Part 15. Requirements concerning certificated lifeboatmen, fire patrolmen, and other vessel specific manning standards are detailed in the parts of the regulations dealing with the inspection of that particular type of vessel. The general manning and crewing requirements for vessels and facilities operating on the U.S. Outer Continental Shelf are contained in Part 141 of Title 33 (Subchapter N, Outer Continental Shelf Activities).

AUDIENCE:

Primary: Marine Inspectors (MI); Enlisted Assistant Marine Inspectors (EAMI);
Investigating Officers (IO)

Secondary: Officers in Charge, Marine Inspection (OCMI); Prevention Department Heads (PDH); Chiefs, Inspection Division (CID); Chiefs Investigations Division (CINV);
Marine Inspection Training Officers (MITO)

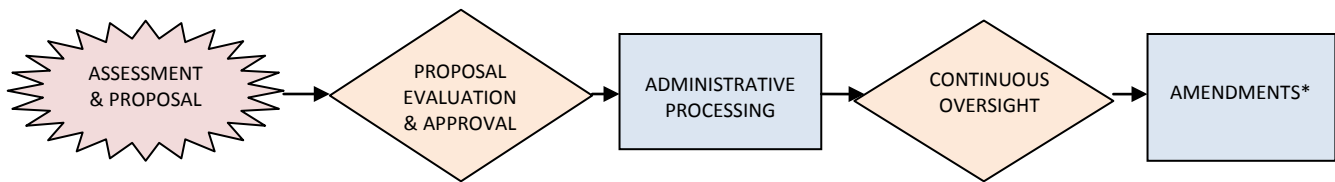

DISCLAIMER:

This work instruction cannot address every scenario or procedure USCG personnel may encounter, nor is every example applicable depending on circumstance. Some situations will result in the need to deviate from guidance to accomplish the mission based on the totality of the circumstance and individual judgment. Personnel may have to deviate, as necessary, to complete the task with greater safety, effectiveness, or efficiency as judgment dictates. Personnel must temper the decision to deviate with maturity and a complete understanding of the mission, situational awareness, scope of practice capabilities, and available resources. Consult with the unit chain of command when feasible and practical.

MI NOT LIMITED:

The MI has a duty to act when a perceived unsafe condition or behavior may result in an inherently dangerous event. The MI should work with the Master to address immediate corrective action. Nothing in this instruction should be construed as limiting the MI from making such tests or inspections as he/she deems necessary to be assured of the safety and seaworthiness of the vessel. The MI consults with the Master of the vessel before requiring a drill or other test or procedure to be conducted to minimize disruption of operations and risk to life or property.

GENERAL PROCEDURE:

*As warranted.

DETAILED PROCEDURE:

1. ASSESSMENT & PROPOSAL

- 1.1 To supplement a manning request or when alternatives to the sample manning scales are sought, the cognizant OCM I should request the company responsible for the operation of the vessel to prepare and submit its proposal for the minimum safe manning of that vessel in accordance with Section **B1.D** of Ref. (a).
- 1.2 In preparing a proposal for the minimum safe manning of a vessel engaged on an international voyage, the company should apply the principles, recommendations and guidelines contained in Ref. (b).
- 1.3 A *Suggested Template: Minimum Safe Manning Proposal* is provided in the **Annex** of Ref. (a), which may be used to prepare and submit a minimum safe manning proposal.

2. PROPOSAL EVALUATION & APPROVAL

- 2.1 In addition to statutory and regulatory requirements, the OCM I should consider the factors outlined in Section **B1.C** of Ref. (a). The established manning level must not be less than the minimums stipulated by law or regulation.
- 2.2 The OCM I should evaluate the company's minimum safe manning proposal to ensure that the provisions outlined in Section **B1.E** of Ref. (a) are adequately addressed.
- 2.3 The sample manning sales and tables in Chapters **B2** & **B7** of Ref. (a) provide guidance on the numbers of credentialed deck and engineer officers, and ratings that may be considered appropriate for different sizes of vessels (tonnage), trading areas, and aggregate propulsion power.
- 2.4 The proposal and resulting determination should be thoroughly documented in MISLE.
- 2.5 If the company's proposal is determined to be sufficient, proceed to Section 3 – Administrative Processing.

- 2.6 If the company's proposal is determined to be insufficient, the OCMI should respond providing justification and outline manning levels that are considered acceptable. This may include requesting an amended minimum safe manning proposal. This justification and any related correspondence should be documented in MISLE.
- 2.7 In accordance with 46 CFR 1.03-20, any person directly affected by a decision or action of an OCMI may, after requesting reconsideration of the decision or action by the cognizant OCMI, make a formal appeal of that decision or action, via the office of the cognizant OCMI, to the District Commander of the district in which the office of the cognizant OCMI is located, or in the case of the Officer in Charge, Activities Europe, to the Atlantic Area Commander, in accordance with the procedures contained in 46 CFR 1.03–15.
- 2.8 Contact the Cognizant District for information regarding waterway navigability determinations and designations.

3. **ADMINISTRATIVE PROCESSING**

3.1 Preparing Safe Manning Documentation

3.1.1 Inspected Vessels (COI)

3.1.1.1 Ref. (c) [[MISLE 5.0 Vessels User Guide](#)] may be used when populating manning details in MISLE. Specifically: Section 4.6 – Manning Requirements; Section 4.7 – Additional Manning Requirements; and Section 4.8 – Routes and Conditions.

3.1.1.2 Ref. (d) [[MISLE Vessel Inspection User Guide](#)] may be used for generating the COI in MISLE. Specifically: Section 2 – Navigate to Vessel Inspection Activity; Section 4 – Create/Edit Domestic Vessel Inspections; and Appendix F – Certificate of Inspection.

3.1.2 Uninspected Vessels (SMD or SML)

3.1.2.1 The SMD and SML should be drafted in accordance with the model templates in the Annex of Ref. (a). Working templates are available in CG Portal; [Model Formats – Safe Manning Docs \(SMD/SML\)](#)

3.2 Formatting Safe Manning Documentation

3.2.1 Safe manning documentation should be formatted with the most stringent manning level in the manning block. Record alternate manning reductions based on length of voyage, hours of operation, vessel service, and geographic limitation in the “Route and Conditions of Operations.”

3.2.2 Format safe manning documentation for Credentialed Officers, including Mates and Engineers, in accordance with Chapter **B3** of Ref. (a).

3.2.3 Format safe manning documentation for GMDSS Operators in accordance with Section **B3.L** of Ref. (a).

- 3.2.4 Format safe manning documentation for Credentialed Ratings, Non-Credentialed Crew, Maintenance-Persons and Maintenance Department in accordance with Chapter **B4** of Ref. (a).
- 3.2.5 Format safe manning documentation for HSC Type Rating in accordance with Section **B2.T** of Ref. (a).
- 3.2.6 Format safe manning documentation for Certified Lifeboatmen based on the specific lifesaving equipment carriage requirements for the vessel, Chapter **B2** of Ref. (a).

NOTE 2: Where the “Crew Members” field appears in the manning block on the COI, it is intended to be the summation of the minimum required crew and not an individual or independent manning requirement. A future MISLE enhancement will eliminate this field. Any miss-assignment of an individual or independent manning requirement under the “Crew Members” field should be reconciled under the appropriate crew classification and amended.

NOTE 3: A future MISLE enhancement will eliminate the “Non Licensed Engineer De[pts]” field. Any miss-assignment of an individual or independent manning requirement under this field should be reconciled under the appropriate crew classification and amended.

3.3 Review & Approval

- 3.3.1 The completed drafts should be routed to the OCMI, or delegate, via the unit chain of command.
- 3.3.2 The routed package should include:
- Minimum safe manning proposal with any attachments;
 - VCP;
 - MISLE activity summary;
 - Any related correspondence; and,
 - Draft manning documentation.
- 3.3.3 Quality control reviewers should:
- Verify that COI manning entries conform to Section **A.3.H** of Ref. (e);
 - Verify that manning requirements correspond with vessel route, particulars, and service;
 - Verify that any safe manning endorsements correspond with the Common COI/SMD Sample Endorsements in the **Annex** of Ref. (a);
 - Verify that vessel particulars and owner/operator details are properly stated by comparing to VCP, COD, CSR, SMC/DOC, convention certificates and classification documents, as applicable;
 - Review the minimum safe manning proposal;

- Verify safe manning documentation formatting in accordance with Ref. (a);
 - Review the associated MISLE activity and confirm that the minimum safe manning proposal is uploaded to the associated MISLE activity under “Documents.” Ref. (d) [[MISLE Vessel Inspection User Guide](#)] may be used for managing documents in MISLE. Specifically: Section 4.12 – Documents; and,
 - Ensure that the total number of persons allowed does not exceed the total number of persons for which lifesaving appliances are provided. Verify agreement with any applicable SOLAS safety equipment certificates.
 - Verify that the sum of the required manning, passengers, other persons in crew, persons in addition to crew, offshore workers, industrial and scientific personnel equals the total number of persons allowed. This includes any alternate manning reductions recorded in the “Route and Conditions of Operations.”
- 3.3.4 Safe manning documentation should only be signed by the OCMI or authorized delegate.
- 3.3.5 Signed safe manning documentation should be uploaded to MISLE under the associated activity. Ref. (d) [[MISLE Vessel Inspection User Guide](#)] may be used for managing documents in MISLE. Specifically: Section 4.12 – Documents
- 3.3.6 Deliver the original safe manning documentation to the appropriate vessel representative. Additionally, the *Master’s Field Guide to U.S. Vessel Manning*, provided in the **Annex** of Ref. (a), should be distributed as an accompaniment.

4. OVERSIGHT

- 4.1 During inspection and investigation activities, Coast Guard personnel shall verify compliance with the manning level specified on the safe manning documentation, as well as with any other applicable manning regulations (i.e., watchkeeping, work hour provisions and rest periods, and shipboard maintenance) in accordance with Sections **B1.F**, **B1.K**, **B5.F** & **B6.A** of Ref. (a).
- 4.1.1 Specifically, Section **B1.F** of Ref. (a) outlines specific instructions regarding the oversight of safe manning, including; examples of clear grounds, expanded inspections and control procedures/deficiencies.
- 4.1.2 Oversight may also arise from investigations into vessel casualties and reports by vessel crewmembers. While conducting marine casualty investigations, IOs should actively check for causal factors stemming from safe manning as well as with any other applicable manning regulations (i.e., watchkeeping, work hour provisions and rest periods, and shipboard maintenance). Any potential SMS deficiencies identified during a post-casualty investigation shall be immediately reported to the unit’s Inspections Division for potential follow-up actions.

NOTE 4: Reference Section **A.6.B** of Ref. (e) for specific instructions regarding the issuance of the Permit to Proceed to Another Port for Repairs (PTP), Form CG-948. In the case that the COI for a manned inspected vessel is withdrawn and replaced with a PTP, the OCMI should consider issuing a SMD or SML, as appropriate. A SMD should be issued in the case that the vessel is subject to Regulation V/14.2 of SOLAS.

- 4.2 A *Safe Manning Verification check-sheet*, which may be used as a guide for oversight activities, is provided in the **Annex** of Ref. (a).

5. **AMENDMENTS**

- 5.1 Requests for amendments to safe manning documentation should be processed in accordance with Sections 1 – 3 of this work instruction.
- 5.1.1 Title 46 CFR 15.505 requires that all requests for changes in manning be made to the OCMI who last issued the COI¹, unless the request is made in conjunction with an inspection for certification, in which case the request should be addressed to the OCMI conducting the inspection.
- 5.2 Ref. (d) [[MISLE Vessel Inspection User Guide](#)] may be used for generating the COI amendment in MISLE. Specifically: Section 2 – Navigate to Vessel Inspection Activity; Section 4 – Create/Edit Domestic Vessel Inspections; and Appendix F – Certificate of Inspection.
- 5.3 Refer to Chapter **B6** of Ref. (a) for machinery space attendance and/or reduced manning requests based on automated features.
- 5.4 Refer to Sections **B1.K.3**, **B5.F.3** and **B6.A.5** of Ref. (a) for increases in manning levels. Involuntary increases in vessel manning must be substantiated by objective evidence and should be processed in accordance with Sections 1 – 3 of this work instruction.

NOTE 5: Reference Section **B1.F** of Ref. (a) for specific instructions regarding safe manning, including examples of clear grounds, expanded inspections and control procedures/deficiencies.

SUGGESTIONS / CHANGES:

CG-CVC-1 will maintain this work instruction. Direct any suggested improvements or comments to CG-CVC-1@uscg.mil by filing a Corrective Action Request (CAR).

ATTACHMENT(S):

None.

¹ Includes Safe Manning Document (SMD) and Safe Manning Letter (SML)

Transportation Worker Identification Credential (TWIC), 46 CFR 10.203.

All mariners serving on vessels with a U.S. Coast Guard approved security plan, with secure areas, are required to hold a valid TWIC. Refer to MSM III.B3.P for details.

Global Maritime Distress & Safety System (GMDSS) Radio Operator, 46 CFR 15.817.

- The controlling authority for radio operators & installations is generally a function of the FCC.
- All deck officers, including the master, on seagoing vessels equipped with a GMDSS, except those vessels listed in 46 CFR 15.105(f) & (g), must provide evidence of a valid STCW endorsement as GMDSS radio operator.
- The requirement for such persons shall be noted on the vessel's COI or SMD.
- Effective March 25, 2008, FCC GMDSS licenses are issued for the holder's lifetime.

Refer to MSM III.B3.L for details.

IV. Working Hours

In addition to prescribing watch requirements, 46 U.S.C. 8104 sets limitations on working hours, prescribes certain rest periods, and prohibits unnecessary work on Sundays & certain holidays when the vessel is in a safe harbor. It is the responsibility of the master or person in charge to ensure that these limitations are met. Vessels subject to STCW have additional work hour limits & schedule/recordkeeping requirements. The requirements for rest periods need not be maintained in the case of an emergency or in other overriding operational conditions. Refer to MSM III.B5 for details.

Rest hour violations should be accompanied by documented corrective action, including compensatory rest period records.

V. Watches

The master is responsible for ensuring that adequate watches are established for the both at-sea and in-port operations that necessitate watchkeeping personnel, including those whose duties involve designated safety, security and prevention of pollution functions. In exercising this responsibility, the master must take into account applicable statutory and regulatory provisions and international conventions. Refer to MSM III.B5 for details.

Gross Tonnage	Route	Length of Voyage	Watch System
General			
≤100 GRT	Domestic-Any	≤12 Hours	1
≤100 GRT	Domestic-Any	>12 Hours	2
>100 GRT	Rivers, L/B/S	≤12 Hours	1
>100 GRT	Rivers, L/B/S	>12 Hours	2
>100 GRT	Oceans/Great Lakes	Any Length	3
Towing Vessels			
≤100 GRT	Domestic-Any	≤12 Hours	1
≤100 GRT	Domestic-Any	>12 Hours	2
<200 GRT	Any	Any Length	2
≥200 GRT	Rivers, L/B/S	Any Length	2
≥200 GRT	Oceans/Great Lakes	<600 Miles	2
≥200 GRT	Oceans/Great Lakes	≥600 Miles	3
Offshore Supply Vessels			
≤100 GRT	Domestic-Any	≤12 Hours	1
≤100 GRT	Domestic-Any	>12 Hours	2
>100 GRT	Any	<600 Miles	2
>100 GRT	Any	≥600 Miles	3
See 46 U.S.C. 8104 & 46 CFR 15.705 for Commercial Fishing, Fish Processing and Fish Tender Vessels.			

Machinery Space Attendance, 46 CFR 15.715.

Vessels authorized to operate with a minimally attended or periodically unattended machinery space (MAMS/PUMS) will have a "Conditions of Operation" endorsement on the COI or annotation on the SMD. Refer to MSM III.B6.A for details.

Specific inquiries should be addressed to your local Officer in Charge, Marine Inspection (OCMI).

U.S. Department of Homeland Security

Commandant United States Coast Guard

United States Coast Guard

Master's Field Guide: U.S. Vessel Manning

An accompaniment to MSM Volume III: Marine Industry Personnel, COMDTINST M16000.8B Change 2.

Introduction

"The Company should ensure that each ship is manned with qualified, certificated and medically fit seafarers in accordance with national and international requirements." –ISM Code Part A/6.2

It is the responsibility of the owner, managing operator, master, or person in charge to ensure that their vessels are operated in accordance with the Safe Manning, Working Hours and Watchkeeping requirements of the applicable navigation and shipping laws & regulations. This includes the obligation to make certain that their vessels are crewed with personnel of appropriate grades who have been properly trained and certificated.

The purpose of this Master's Field Guide is to provide a reference to the laws, regulations & policy pertaining to U.S. vessel manning, credentials, watches, working hours and the shipment & discharge of mariners. It is not an all-inclusive guideline or policy. Credential images not to scale.

Master's are reminded to reference the company safety management system (SMS), as applicable, for vessel specific information.

I. Vessel Manning

Certificate of Inspection (COI), 46 CFR 15.105.

The COI serves as the Safe Manning Document (SMD) for inspected U.S. vessels.

The COI states the minimum numbers and categories of credentialed officers and crewmembers necessary for the safe operation of inspected vessels. It also lists maximum number of passengers and total persons that may be carried. The period of validity is stated on the certificate.

Uninspected vessels operating on an international voyage may be issued a SMD in accordance with SOLAS Chapter V/14.

- ✓ Review the COI/SMD for validity and accuracy.
- ✓ Ensure that the number & composition of crew conforms to the COI/SMD.
- ✓ Comply with the COI/SMD routes & conditions.

Except as provided in 46 CFR 15.725, no vessel may be navigated unless it has in its service and onboard the crew complement required by the COI (46 CFR 15.515).

Crew Vacancies & Sailing Short, 46 CFR 15.725.

In certain cases, 46 U.S.C. 8101 permits a vessel to be navigated without all of the required positions being filled if the master determines that the vessel is sufficiently manned for the voyage. The master is required to report the shortage and explain the cause of it, in writing, to the nearest OCMI. Refer to MSM III.B1.I for details.

II. Shipment & Discharge

A person may not employ or engage an individual, and an individual may not serve, in a position for which a TWIC and/or MMC is required by law or regulation, unless the individual holds all required credentials authorizing service in that capacity and the individual serves within any restrictions placed on the credential (46 CFR 15.401).

The original MMC, along with a valid medical certificate & TWIC must be presented to the master at the time of employment or before signing Articles. The MMC & TWIC should be verified as valid for the period of employment. If a medical certificate expires during a voyage, it will remain valid until the next U.S. port of call, provided that the period after expiration does not exceed 90 days (46 CFR 15.1103(h)(3)). See also;

- Foreign Crewmembers → MSM III.B1.H & I
- Shipboard Familiarization → MSM III B5
- Articles → MSM III.C1.E
- Discharges → MSM III.C1.F
- Official Logbook → MSM III.C1.G
- Display of Credentials → MSM III Annex-9

III. Credentials

Merchant Mariner Credential (MMC), 46 CFR 10.201 - 205.

The personal information on the data page includes all data elements required by the Seafarers' Identify Documents Conventions (Revised) (ILO-185). The MMC is not valid without signature of the holder.

- ✓ Verify that all crew members hold signed, appropriate and valid credentials for the position in which they are engaged.

Consider the following, not all inclusive list, when verifying crew credentials & training:

<input type="checkbox"/> Route	<input type="checkbox"/> Basic Training
<input type="checkbox"/> Tonnage	<input type="checkbox"/> Lifeboatman
<input type="checkbox"/> Grade Level/Capacity	<input type="checkbox"/> Security Training
<input type="checkbox"/> Propulsion Power	<input type="checkbox"/> Pilotage
<input type="checkbox"/> Propulsion Mode	<input type="checkbox"/> Radar Observer
<input type="checkbox"/> Trade Restrictions	<input type="checkbox"/> ARPA
<input type="checkbox"/> Limitations	<input type="checkbox"/> GMDSS
<input type="checkbox"/> Citizenship	<input type="checkbox"/> Tankerman
<input type="checkbox"/> Food Handler	<input type="checkbox"/> Towing/TOAR
<input type="checkbox"/> Crisis Management & Human Behavior (Passengers)	

This is an example of the endorsement data page that will be printed on a MMC. Each page contains the reference number of the mariner and the serial number of the booklet. The MMC contains both domestic & STCW endorsements.

NOTE: After 1 January 2017*, all mariners serving on vessels subject to STCW must meet the STCW Convention standards, including the 2010 Amendments.

Medical Certificate, 46 CFR 10.301.

Each medical certificate will have three expiration dates; STCW, First Class Pilotage & national. A valid medical certificate must be carried when serving under the authority of a MMC. The medical certificate will note any operational limitations on the mariner's authority to serve. See MSM III ANNEX-11 for details.

Safe Manning Verification Check-sheet [MSM III.B1.F] (Not all inclusive).

COMDTCHANGENOTE 16000
20 JULY 2016

COMMANDANT CHANGE NOTICE 16000

Subj: CH-2 TO MARINE SAFETY MANUAL VOLUME II, COMDTINST M16000.7B

1. PURPOSE. This Commandant Change Notice publishes a change to Marine Safety Manual Volume II, COMDTINST M16000.7B.
2. ACTION. All Coast Guard unit commanders, commanding officers, officers-in-charge, deputy/assistant commandants, and chiefs of headquarters staff elements shall comply with the provisions of this Commandant Change Notice. Internet release is authorized.
3. DIRECTIVES AFFECTED. With the addition of this Commandant Change Notice, Marine Safety Manual Volume II, COMDTINST M16000.7B, is updated. The following policy letters are cancelled: CG-543 Policy Letter 09-04 Change 1, CG-543 Policy Letter 11-08, CG-CVC Policy Letter 13-05 and G-MRP Policy Letter 02-96 dated June 07, 1996.
4. DISCUSSION. This does not constitute a substantial change to the content of the previous version of this Manual. The primary reason for this change is to incorporate existing policy into the Manual to reduce the number of places Coast Guard members have to reference for guidance. Numerous non-technical changes have been made throughout the document including correcting misspellings and incorrect paragraph numbering.
5. DISCLAIMER. This guidance is not a substitute for applicable legal requirements, nor is it itself a rule. It is intended to provide operational guidance for Coast Guard personnel and is not intended to nor does it impose legally-binding requirements on any party outside the Coast Guard.
6. MAJOR CHANGES.
 - a. The content of Section A3, Documentation of Vessel Inspections has been edited with additional guidance on how to document dry-dock dates. This guidance can be found on page 14.

DISTRIBUTION – SDL No. 167

	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z

D	x	x	x	x							x															
E														x												
F			x							x																
G																										
H																										

NON-STANDARD DISTRIBUTION:

- b. Created a new section, A7 on commercial vessel compliance personnel proficiency. This incorporates policy from CG-543 Policy Letter 09-04 Change 1, Marine Inspector/Port State Control Officer Certification Policy; CG-543 Policy Letter 11-08, Civilian Apprentice Marine Inspector (CAMI) Program; and CG-CVC Policy Letter 13-05, Award for Excellence in Marine Inspections.
- c. The content of Section B1, Inspection of Vessels for Certification has been edited to add additional Sectors that conduct inspection of U.S. vessels in foreign countries. This guidance can be found on pages 8-9.
- d. G-MRP Policy Letter 02-96, dated June 07, 1996, Overseas Inspection and Examination Fee Collection Policy on payment of user fees and overseas inspections expenses has been incorporated into the manual. The guidance in the policy letter can be found in Section B1, page 8a.
- e. Completed a significant revision to the content of Section B1 involving Machinery Inspections to provide clarification of the inspection requirements. This guidance can be found on B1, pages 29-30.
- f. Completed a significant revision to the content of Section B1 involving the inspection and hydrostatic tests of boilers to provide clarification of the requirements. This guidance can be found on pages 29-51i.
- g. The content of Section B1, Inspection of Vessels for Certification has been edited to include guidance from CG-MOC Policy Letter 11-97 for the use of miniature thermal over-current circuit breakers on small passenger vessels. This guidance can be found on pages 58-58a.
- h. The content of Section B4, Inspection Procedures Applicable to Vessel Types, Classes, and Categories has been edited to add Great Lakes Barges. This section was accidentally removed during the 2000 update. This guidance can be found on pages 33-33a.
- i. The content of Section B4, Inspection Procedures Applicable to Vessel Types, Classes, and Categories has been edited for certificated vessels that change status to Permanently Moored Craft. This guidance can be found on pages 45-49b.
- j. The content of Section D1, Port State Control, and General Aspects of Port State Control Examinations has been edited to add policy for stowaway incidents. This incorporates portions of the Coast Guard Stowaway Policy from ALCOAST 0343/05. This guidance can be found on pages 50-52.
- k. The content of Section D4, Port State Control, Targeting of Foreign Vessels has been edited with the removal of Column V of the ISPS/MTSA Security Compliance Targeting Matrix in Section D4 based on changes to the targeting policy as described in CG-5P Policy Letter 01-14. The targeting matrix can be found on page 13.

- l. The content of Section D4, Port State Control, Targeting of Foreign Vessels has been edited to add stowaway incidents as an ISPS II exam on ISPS/MTSA targeting matrix under column IV. The targeting matrix can be found on page 13.
- m. The content of Section D4, Port State Control, Targeting of Foreign Vessels has been edited to add port state control exam downgrade options for certain foreign freight vessels as described in CG-CVC's message of 22652Z JUL 14. This guidance can be found on pages 18a-18b.
- n. Completed a significant revision to Section E3, Safety Management Systems. This guidance can be found on pages 1-36.
- o. The content of Section G1, Offshore – Regulations, Policy and Guidance for a Unit Conducting OCS Activity, has been edited to add Overseas Exams for Issuance of a COC and a COI for MODUs and Floating OCS Facilities. This guidance can be found on pages 5-10.
- p. The content of Section G1, Offshore – Regulations, Policy and Guidance for a Unit Conducting OCS Activity, has been edited to add Additional Restrictions for MODUs or fixed OCS facilities. This guidance can be found on page 23-24.
- q. The content of Section G2, Offshore – Procedures Applicable to MODUs (U.S.), has been edited to add Load Line Authorization and clarify Single Voyage Load Line issuance for vessels operating on the OCS. This guidance can be found on pages 18a-18b.
- r. The content of Section G3, Offshore – Procedures Applicable to MODUs (Foreign), has been edited to incorporate the Cross Reference of Regulations Pertaining to U.S. and Foreign Flag MODUs from Navigation and Vessel Inspection Circular (NVIC) 03-88. The guidance in the NVIC can be found on pages 32-42.
- s. The content of Section G4, Offshore – Procedures Applicable to Floating OCS Facilities, has been edited to add an example of a Quarters Habitable Letter. This guidance can be found on pages 4-6.
- t. The content of Section G4, Offshore – Procedures Applicable to Floating OCS Facilities, has been edited to add an example of a Control of Hydrocarbon Flow “Buy-Back Gas” Approval Letter. This guidance can be found on pages 6-7.
- u. The content of Section G4, Offshore – Procedures Applicable to Floating OCS Facilities, has been edited to add Manning of Non-self Propelled Floating Outer Continental (OCS) Facilities. This guidance can be found on pages 19-21.
- v. The content of Section G6, Offshore – Procedures Applicable to Other Vessels Engaged in OCS Activities, has been edited to add the definition of an OSV which comes from the 2010 Coast Guard Authorization Act. This guidance can be found on page 2.

- w. The content of Section G6, Offshore – Procedures Applicable to Other Vessels Engaged in OCS Activities has been edited to add Accommodation Service Vessels. This guidance can be found on pages 23-24.
- x. Due to the numerous changes and shifting down of pages, Section G, Chapters 1 and 4 have been replaced in their entirety.

7. ENVIRONMENTAL ASPECT AND IMPACT CONSIDERATIONS.

- a. The development of this Commandant Change Notice and the general policies contained within it have been thoroughly reviewed by the originating office in conjunction with the Office of Environmental Management, and are categorically excluded (CE) under current USCG CE # 33 from further environmental analysis, in accordance with Section 2.B.2. and Figure 2-1 of the National Environmental Policy Act Implementing Procedures and Policy for Considering Environmental Impacts, COMDTINST M16475.1 (series).
- b. This directive will not have any of the following: significant cumulative impacts on the human environment; substantial controversy or substantial change to existing environmental conditions; or inconsistencies with any Federal, State, or local laws or administrative determinations relating to the environment. All future specific actions resulting from the general policies in this Commandant Change Notice must be individually evaluated for compliance with the National Environmental Policy Act (NEPA), DHS and Coast Guard NEPA policy, and compliance with all other environmental mandates.

8. DISTRIBUTION. No paper distribution will be made of this Commandant Change Notice. An electronic version will be located on the following Commandant (CG-612) web sites. Internet: <http://www.uscg.mil/directives/>, and CGPortal: <https://cg.portal.uscg.mil/library/directives/SitePages/directives.aspx>

9. PROCEDURE. Remove and replace the following sections of The Marine Safety Manual Volume II, COMDTINST M16000.7B:

Remove

10. RECORDS MANAGEMENT CONSIDERATIONS. This Commandant Change Notice has been thoroughly reviewed during the directives clearing process, and it has been determined that there are records scheduling requirements, in accordance with Federal Records Act, 44 U.S.C. 3101 et seq., NARA requirements, and Information and Life Cycle Management Manual, COMDTINST M5212.12 (series). This policy has significant or substantial change to existing records management requirements, or inconsistencies with existing determinations relating to documentation requirements.
11. FORMS/REPORTS. The forms called for in this Commandant Change Notice are available in USCG Electronic Forms on the Standard Workstation or on the Internet: <http://www.uscg.mil/forms/>; CGPortal at <https://cgportal.uscg.mil/library/forms/SitePages/Forms.aspx>; and Intranet at <http://cgweb.comdt.uscg.mil/CGForms>.
12. REQUEST FOR CHANGES. Request for changes to the Marine Safety Manual Volume II, COMDTINST M16000.7B may be sent to Commandant (CG-CVC-1) at (202) 372-1224 or marinesafetymanual@uscg.mil.

25 JUN 2014

COMMANDANT CHANGE NOTICE 16000

Subj: CH-1 TO THE MARINE SAFETY MANUAL VOLUME II, COMDTINST
M16000.7B

1. PURPOSE. This Commandant Change Notice publishes a change to The Marine Safety Manual Volume II, COMDTINST M16000.7B.
2. ACTION. All Coast Guard unit commanders, commanding officers, officers-in-charge, deputy/assistant commandants, and chiefs of headquarters staff elements shall comply with the provisions of this Commandant Change Notice. Internet release is authorized.
3. DIRECTIVES AFFECTED. With the addition of this Commandant Change Notice, The Marine Safety Manual Volume II, COMDTINST M16000.7B, is updated. The following Navigation and Vessel Inspection Circulars (NVIC) are cancelled: 08-68 and 03-88 Ch. 1. The following Policy Letters are cancelled: CG-CVC Policy Letter 12-08, MOC Policy Letter Nos. 1-00, 02-01, 02-02, 03-01, 01-03, 05-03 and 02-05, CG-543 Policy Letters 10-03 and 11-06, CG-3PCV Policy Letter 07-04, and G-PCV Policy Letter 06-05.
4. DISCUSSION. This does not constitute a substantial change to the content of the previous version of this Manual. The primary reason for this change is to incorporate existing policy into the Manual to reduce the number of places Coast Guard members have to reference for guidance. Numerous non-technical changes have been made throughout the document including correcting misspellings and incorrect paragraph numbering.
5. DISCLAIMER. This guidance is not a substitute for applicable legal requirements, nor is it itself a rule. It is intended to provide operational guidance for Coast Guard personnel and is not intended to nor does it impose legally-binding requirements on any party outside the Coast Guard.

DISTRIBUTION – SDL No. 164

NON-STANDARD DISTRIBUTION:

6. MAJOR CHANGES.

- a. CG-CVC Policy Letter 12-08, Guidance Implementing the International Convention on the Control of Harmful Anti-Fouling Systems on Ships, has been incorporated into the Manual. The guidance in the policy letter for domestic vessels can be found in section B3 on pages 43-45 and for foreign vessels in section D1 on pages 31-32.
- b. CG-MOC Policy letter No. 1-00, Acceptance of the International Code of Safety for High-Speed Craft (HSC Code) as Equivalent to Meeting Title 46, Code of Federal Regulations (CFR), Subchapter H or Subchapter I, has been incorporated into the Manual. The guidance in the policy letter can be found in section B4 on pages 73-74.
- c. CG-543 Policy Letter 10-03, Banning of Foreign Vessels, has been incorporated into the Manual. The guidance in the policy letter can be found in section D2 on pages 12-16.
- d. CG-3PCV Policy Letter 07-04, Regulatory Interpretations For Notice of Arrival Regulation, and G-PCV Policy Letter 06-05, Regulatory Interpretation for Notice of Arrival Regulation, have been incorporated into the Manual. The guidance in these policy letters can be found in section D4 on pages 24-25.
- e. CG-MOC Policy Letter 02-05, Navigation Safety Equipment Testing Required Under 33 CFR 164.25 For Cruise Ships, has been incorporated into the Manual. The guidance in the policy letter can be found in section D7 on page 6.
- f. CG-MOC Policy Letter 05-03, Operator Requirements for Foreign Flagged Cruise Ships Using Lifeboats as Tenders, has been incorporated into the Manual. The guidance in the policy letter can be found in section D7 on pages 28 and 34.
- g. The content of Section B8, Offshore, has been incorporated into the new Section G, Outer Continental Shelf Activities. Section B8 will remain as a place holder for future additions to the MSM. Portions of NVICs 07-68, 12-69, 06-72 Ch. 1, 04-78 Ch. 1, 10-81 Ch. 1, 10-82 Ch. 1, 07-84, 03-87, 1-89, 2-89, 10-92 Ch. 2, 02-95 Ch. 2, 02-99 and 02-07 are contained within newly created Section G, Outer Continental Shelf Activities. Portions of CG-543 Policy Letters 07-02 and 10-01 are included in this section. NVICs 08-68 and 03-88 Ch. 1 are included in their entirety and hereby cancelled per paragraph 3. CG-MOC Policy Letters 02-01, 03-0, 01-03, 02-02 and CG-543 Policy Letter are included in their entirety and cancelled per paragraph 3. Details regarding the location of the cancelled policy letters and NVIC's are provided below.
- h. NVIC 03-88, Ch. 1, Letters of Compliance to foreign Documented Mobile Offshore Drilling Units Operating on the Outer Continental Shelf of the United States, has been incorporated into the Manual. The guidance in the NVIC can be found in Section G, pages G3-3 through 18.
- i. NVIC 08-68, Classification of Vessels as Self-propelled, has been incorporated into the Manual. The guidance in the NVIC can be found in Section A, page A6-10.

- j. CG-MOC Policy Letter 03-01, Pressure Vessel internal Examination and Relief valve testing for Foreign Flag MODUs Operation on the Outer Continental Shelf, has been incorporated into the Manual. The guidance in the policy letter can be found in Section G, pages G3-12 and G3-16.
- k. CG-MOC Policy Letter 02-01, Regular Complement of Crew Determinations for Units Engaged in Outer Continental Shelf (OCS) Activities, has been incorporated into the Manual. The guidance in the policy letter can be found in Section G, page G1-11.
- l. CG-MOC Policy Letter 02-02, Fixed Platform Inspection Program, has been incorporated into the Manual. The guidance in the policy letter can be found in Section G, page G5-3.
- m. CG-MOC Policy Letter 03-01, In-Service Inspection Program (ISIP) for Floating Facilities in the OCS, has been incorporated into the Manual. The guidance in the policy letter can be found in Section G, pages G1-12 and G4-8.
- n. CG-543 Policy Letter 11-06, Risked Based Targeting of Foreign Flagged Mobile Offshore Drilling Units (MODUs), has been incorporated into the Manual. The guidance in the policy letter can be found in Section G, pages G3-22 through 31.
- o. Other guidance to the field that has been sent through monthly message traffic has been incorporated into the appropriate sections of the Manual. Due to the numerous changes and the shifting down of pages, Section D Chapters 1 and 2 have been replaced in their entirety.

7. ENVIRONMENTAL ASPECT AND IMPACT CONSIDERATIONS.

- a. The development of this Commandant Change Notice and the general policies contained within it have been thoroughly reviewed by the originating office in conjunction with the Office of Environmental Management, and are categorically excluded (CE) under current USCG CE # 33 from further environmental analysis, in accordance with Section 2.B.2. and Figure 2-1 of the National Environmental Policy Act Implementing Procedures and Policy for Considering Environmental Impacts, COMDTINST M16475.1 (series). Because this Commandant Change Notice contains guidance on, and provisions for, compliance with applicable environmental mandates, Coast Guard categorical exclusion #33 is appropriate.
- b. This directive will not have any of the following: significant cumulative impacts on the human environment; substantial controversy or substantial change to existing environmental conditions; or inconsistencies with any Federal, State, or local laws or administrative determinations relating to the environment. All future specific actions resulting from the general policies in this Commandant Change Notice must be individually evaluated for compliance with the National Environmental Policy Act (NEPA), DHS and Coast Guard NEPA policy, and compliance with all other environmental mandates. Due to the administrative and procedural nature of this Commandant Change Notice, and the environmental guidance provided within it for compliance with all applicable environmental laws prior to promulgating any directive, all applicable environmental considerations are addressed appropriately in this Commandant Change Notice.

8. DISTRIBUTION. No paper distribution will be made of this Change Notice. An electronic version will be located on the following Commandant (CG-612) web sites. Internet: <http://www.uscg.mil/directives/>, and CGPortal: <https://cgportal2.uscg.mil/library/directives/sitepages/home.aspx>.
9. PROCEDURE. Remove and replace the following sections of The Marine Safety Manual Volume II, COMDTINST M16000.7B:

<u>Remove</u>	<u>Replace</u>
Page A2-7 – A2-17	Page A2-7 – A2-17
Page A3-3 – A3-29	Page A3-3 – A3-29
Page B4-73 – B4-86	Page B3-43 – B3-45
Page D1-1 – D1-48	Page B4-73 – B4-88
Page D2-1 – D2-22	Page D1-1 – D1-53
Page D4-18- D4-24	Page D2-1 – D2-27
Page D6-17 – D6-36	Page D3-6
Page D7-18	Page D4-18 – D4-24
Page D7-20	Page D6-17 – D6-37
Page B8-1 – 41	Page D7-18
	Page D7-20
	Section G (Chapters 1-6)

10. RECORDS MANAGEMENT CONSIDERATIONS. This Commandant Change Notice has been thoroughly reviewed during the directives clearing process, and it has been determined that there are records scheduling requirements, in accordance with Federal Records Act, 44 U.S.C. 3101 et seq., NARA requirements, and Information and Life Cycle Management Manual, COMDTINST M5212.12 (series). This policy has significant or substantial change to existing records management requirements, or inconsistencies with existing determinations relating to documentation requirements.
11. FORMS/REPORTS. The forms called for in this Manual are available in USCG Electronic Forms on the Standard Workstation or on the Internet: <http://www.uscg.mil/forms/>; CGPortal at <https://cgportal.uscg.mil/delivery/Satellite/uscg/References>; and Intranet at <http://cgweb.comdt.uscg.mil/CGForms>.
12. REQUEST FOR CHANGES. Request for changes to the Marine Safety Manual Volume II, COMDTINST M16000.7B may be sent to Commandant (CG-CVC-1) at (202) 372-1224 or CG-CVC-1@uscg.mil.

P. F. THOMAS /s/
Rear Admiral, U.S. Coast Guard
Assistant Commandant for Prevention Policy

6. TEXT CHANGES. Changes to the text of this Manual include:
 - a. Full alignment with Deputy Commandant for Operations Organization 3.0 for clarity of roles and responsibilities and facilitation of communications with appropriate offices in Headquarters.
 - b. Updated policy regarding Port State Control to provide consistency with other guidance promulgated since the existing manual was last updated including NVIC 06-03 (series) and NVIC 03-08.
 - c. Inclusion of policy concerning lifesaving equipment and related procedures omitted in error from the previous edition of the manual. In addition, some sections are updated to conform to new regulations or SOLAS revisions.
 - d. A revised definition of bulk cargoes as it pertains to seagoing barges to align with the actual text of the 46 USC 3302(m).
 - e. Changes reflecting a shift from MSIS to MISLE processes.
 - f. Updated guidance on drydock extension requests.
 - g. Incorporates updated information on the Alternate Compliance Program that was previously authorized by COMDTNOTE 16000 of 05MAY06 but never distributed as a change to the existing Manual.
 - h. Amends text regarding appeals to comply with the language stipulated in 2010 Coast Guard Authorization Act, Pub. L. 111-281 which amended Chapter 5 of 14 USC. Amendment specifies qualifications necessary to adjudicate marine safety appeals.
7. REQUESTS FOR CHANGES. Units and individuals may recommend changes by writing via the chain of command to: Commandant (CG-CVC); CG-CVC-1@uscg.mil.
8. DISCLAIMER. This guidance is not a substitute for applicable legal requirements, nor is it itself a rule. It is not intended to nor does it impose legally binding requirements on any party. It represents the Coast Guard's current thinking on this topic and may assist industry, mariners, the General Public, and the Coast Guard, as well as other federal and state regulators, in applying statutory and regulatory requirements. You can use an alternative approach for complying with these requirements if the approach satisfies the requirements of the applicable statutes and regulations. If you want to discuss an alternative approach (you are not required to do so), you may contact Commandant (CG-CVC) who is responsible for implementing this guidance.

9. RECORDS MANAGEMENT CONSIDERATIONS. This Manual has been thoroughly reviewed during the directives clearance process, and it has been determined there are further records scheduling requirements, in accordance with Federal Records Act, 44 U.S.C. 3101 et seq., National Archives and Records Administration (NARA) requirements, and Information and Life Cycle Management Manual, COMDTINST M5212.12 (series). This policy creates significant or substantial change to existing records management requirements.
10. ENVIRONMENTAL ASPECT AND IMPACT CONSIDERATIONS.
- a. The development of this Manual and the general policies contained within it have been thoroughly reviewed by the originating office in conjunction with the Office of Environmental Management, and are categorically excluded (CE) under current USCG CE # 33 from further environmental analysis, in accordance with Section 2.B.2. and Figure 2-1 of the National Environmental Policy Act Implementing Procedures and Policy for Considering Environmental Impacts, COMDTINST M16475.1 (series). Because this Manual contains guidance on, and provisions for, compliance with applicable environmental mandates, Coast Guard categorical exclusion #33 is appropriate.
- b. This directive will not have any of the following: significant cumulative impacts on the human environment; substantial controversy or substantial change to existing environmental conditions; or inconsistencies with any Federal, State, or local laws or administrative determinations relating to the environment. All future specific actions resulting from the general policies in this Manual must be individually evaluated for compliance with the National Environmental Policy Act (NEPA), DHS and Coast Guard NEPA policy, and compliance with all other environmental mandates. Due to the administrative and procedural nature of this Manual, and the environmental guidance provided within it for compliance with all applicable environmental laws prior to promulgating any directive, all applicable environmental considerations are addressed appropriately in this Manual.
11. FORMS/REPORTS. The forms referenced in this Manual are available in USCG Electronic Forms on the Standard Workstation or on the Internet:
<http://www.uscg.mil/forms/>; CG Portal
<https://cgportal2.uscg.mil/delivery/Satellite/CG611/FORMS> and Intranet at
<http://cgweb.comdt.uscg.mil/CGForms>.

USCG Marine Safety Manual, Vol. II: Materiel Inspection
SECTION A: MARINE INSPECTION ADMINISTRATION
**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

A. AUTHORITY FOR THE INSPECTION OF VESSELS

1. General

The Coast Guard administers navigation and vessel inspection laws and regulations governing marine safety. It is the Coast Guard's responsibility to inspect the vessels regulated by those laws. Each marine safety unit must maintain current copies of Titles 33 and 46 of the Code of Federal Regulations (CFR). A statute's applicability to a particular vessel is based on many factors, including the vessel's trade, route, length, tonnage, and/or number of passengers. To avoid misunderstandings, the applicability of each statute should be determined with a particular vessel, type of vessel, or operation in mind. Most statutes establish general requirements for inspection and authorize the Coast Guard to prescribe specific standards by regulation. However, certain statutes contain specific requirements for vessel standards and procedures.

2. Authority

46 U.S.C. 3305, 3307, and 3714 provide the legal basis for Coast Guard inspection of vessels that are subject to inspection under 46 U.S.C. 3301. 43 U.S.C. 1356 provides the legal basis for Coast Guard regulations pertaining to vessels engaged in Outer Continental Shelf activities. 46 U.S.C. 3306 and 3703 direct the Secretary of the Department of Homeland Security (DHS) to prescribe regulations to carry out these requirements.

3. Delegation of Authority from SECDHS

DHS has delegated authority to the Commandant of the U.S. Coast Guard to administer certain navigation and inspection laws. The Commandant accomplishes this by prescribing regulations published in Titles 33, 46 and 49 of the CFR. These regulations incorporate international laws to which the United States is signatory (see Part D of this Chapter), as well as various classification society and industry technical standards. Specific authorities and the process by which regulations are adopted, changed, and deleted are described in 33 CFR 1.05 and in the Marine Safety Manual (MSM) Volume I, Administration and Management, COMDTINST M16000.6 (series), Chapter 2.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

4. Responsibility of the Officer-In-Charge, Marine Inspection (OCMI)

Under 33 CFR 1.01-20, the Officer in Charge, Marine Inspection (OCMI) has the final authority and responsibility for carrying out vessel inspection functions within the OCMI's zone. Signature authority for certain inspection documents may be redelegated pursuant to 46 CFR 2.01-30. (See MSM, Volume I, Administration and Management, COMDTINST M16000.6 (series), Chapter 2, Paragraph 2.I.2.a.(2).) The flow of functional authority from the Commandant to the OCMI and the OCMI to subordinates is described in 46 CFR 1.01-10 and 1.01-15. Descriptions of the duties and responsibilities of the OCMI and other Marine Inspection (MI) Program personnel are presented in MSM Volume I, Administration and Management, COMDTINST M16000.6 (series).

5. Handling Violations of Other Laws

It is essential that all inspection personnel have a working knowledge of the laws under which they are operating. Certain laws concerning the safety of vessels are administered by other agencies, e.g., the U.S. Customs Service (Jones Act), the Federal Communications Commission, the Occupational Safety and Health Administration, the Bureau of Safety and Environmental Enforcement and the Department of Labor. When a vessel is known to be in violation of laws administered by agencies other than the Coast Guard, the agency having jurisdiction should be notified of the circumstances. In some instances, the Coast Guard and another agency will sign a Memorandum of Understanding (MOU). A MOU prescribes specific procedures to be followed to ensure that inspection and enforcement activities of each agency are complimentary to each agency. See MSM Volume X, Interagency Agreements and Acronyms, COMDTINST M16000.15A (series), for a complete listing of all MOUs. Violations of laws administered by the Coast Guard that do not pertain to marine safety should be reported to the cognizant Coast Guard District Commander.

B. REGULATIONS AND STATUTES

1. Code of Federal Regulations (CFR)

The OCMI should maintain current copies of all rules and regulations affecting vessel inspections for use by inspection personnel. Current year copies of the CFR should be available for inspectors to use in performing their duties. Regulations, and the subsequent changes to them, are not effective until published in the *Federal Register*. The following is a partial list of the CFR subchapters applicable to marine safety and vessel inspection:

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

Title 46 CFR		
Subchapter	Part	Subject
A	1-9	Procedures Applicable to the Public
B	10-16	Merchant Marine Officers and Seamen
C	24-29	Uninspected Vessel
D	30-40	Tank Vessels
E	42-46	Load Lines
F	50-64	Marine Engineering
G	66-69	Documentation and Measurement of Vessels
H	70-89	Passenger Vessels
I	90-106	Cargo and Miscellaneous Vessels
I-A	107-109	Mobile Offshore Drilling Units
J	110-113	Electrical Engineering
K	114-122	Small Passenger Vessels Carrying More Than 150 Passengers or with Overnight Accommodations for More Than 49 Passengers
L	125-139	Offshore Supply Vessels
N	146-149	Dangerous Cargoes
O	150-155	Certain Bulk Dangerous Cargoes
Q	159-165	Equipment, Construction and Material: Specifications and Approval
R	166-169	Nautical Schools
S	170-174	Subdivision and Stability
T	175-187	Small Passenger Vessels
U	188-196	Oceanographic Research Vessels

C	171-179	Hazardous Materials Regulations

USCG Marine Safety Manual, Vol. II: Materiel Inspection
SECTION A: MARINE INSPECTION ADMINISTRATION
CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS

2. U.S. Code (U.S.C.), Titles 33, 46, and 50

The OCMI should also maintain current copies of Titles 33, 46, and 50 U.S.C.. The following is a list of significant sections of Titles 33, 46, and 50 U.S.C. applicable to marine safety and vessel inspection:

Title 33 U.S.C.	
Citation	Subject
33 U.S.C. 1221-1232	Statutes for Notice of Arrival and navigation safety regulations.

Title 46 U.S.C.	
Citation	Subject
46 U.S.C. 5101 – 5116	Load line requirements for foreign vessels.
46 U.S.C. 2101(12), 3306(a)(5) and 49 U.S.C. 1801 -1812	Safety requirements for carriage of dangerous articles and substances aboard foreign vessels.
46 U.S.C. 2101(12), (21) and (35), 3504 and 3505	Safety requirements for foreign vessels carrying passengers from any U.S. port to any other place or country.
46 U.S.C. 2101(12), (21), (22) and (35), and Chapter 35	Inspection and certification requirements for all foreign passenger vessels which embark passengers at and carry passengers from a U.S. port. These statutes are also relevant for vessels with valid International Convention For The Safety Of Life At Sea (SOLAS) 74/78 Certificates or Canadian Certificates of Inspection that must be examined to verify compliance with the flag administration's safety verification requirements.
46 U.S.C. 2101(12) and (39), 3301(10) and Chapter 37	Safety requirements that apply, with certain stipulations, to all foreign vessels regardless of tonnage, size, or manner of propulsion, whether or not carrying freight or passengers for hire, that enter U.S. navigable waters while carrying liquid bulk cargoes that are-- a. Flammable or combustible;

USCG Marine Safety Manual, Vol. II: Materiel Inspection
SECTION A: MARINE INSPECTION ADMINISTRATION
CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS

Title 46 U.S.C.	
Citation	Subject
	<p>b. Oil of any type or in any form, including petroleum, fuel oil, sludge, oil refuse and oil mixed with wastes, except dredged spoil;</p> <p>c. Designated as a hazardous substance under Section 311(b) of the Federal Water Pollution Control Act (FWPCA) (33 U.S.C. 1321); or</p> <p>d. Designated as hazardous materials under Section 104 of the Hazardous Materials Transportation Act (HMTA) (49 U.S.C. 1803).</p>
46 U.S.C. 2101(21) and 3304	Permission for U.S. vessels transporting cargo to carry a limited number of individuals without being considered a "passenger vessel" for most inspection purposes, and extension of this privilege to cargo vessels of those nations that accord reciprocal treatment.
46 U.S.C. 2101(33) and 3301(7)	Directs that safety requirements of 46 U.S.C. Chapter 33 are applicable to seagoing motor vessels of 300 or more GT.
46 U.S.C. 2101(35) and 3301(8)	Safety requirements for foreign small passenger vessels carrying more than six passengers from a U.S. port.

Title 50 U.S.C.	
Citation	Subject
50 U.S.C. 191	Requirements for security of vessels, harbors and waterfront facilities, and provision for control of the movement of foreign vessels in U.S. waters by the local OCMI/Captain of the Port (See MSM Volume VI).

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

C. BOUNDARY LINE AND TERRITORIAL SEA

1. Boundary Lines

- a. 46 U.S.C. 3301(6) and (7) require inspection of seagoing barges and motor vessels whose definitions in 46 U.S.C. 2101(32) and (33) rely on the use of the Boundary Line.
- b. 46 U.S.C. 5102(b)(6) exempts from the load line statutes a U.S. vessel engaged in a domestic voyage that does not cross the Boundary Line, except a voyage on the Great Lakes.
- c. 46 U.S.C. 8304 limits the application of the Officers Competency Certificate Convention, Geneva, 1936, to the high seas, defined as being "seaward of the Boundary Line".
- d. The vessel Bridge-to-Bridge Radiotelephone Act (33 U.S.C. 1201 et. seq.) requires the carriage of radiotelephones on board certain vessels inside the Boundary Line on the navigable waters of the United States (i.e., inside the 3-mile limit).
- e. 33 U.S.C. 152 limits the length of towing hawsers when operating inside the Boundary Line.
- f. 46 U.S.C. 3302(d) exempts certain vessels that operate inside the Boundary Line within the waters of southeastern Alaska and the State of Washington from inspection requirements. In addition to the above, the "Commercial Fishing Industry Vessel Safety Act of 1988" (46 U.S.C. 4502(b)) requires the carriage of safety equipment by certain uninspected commercial fishing industry vessels when operating beyond the Boundary Line.

NOTE: The U.S. Boundary Lines, as specified in 46 CFR Part 7, are used to determine the applicability of the six statutes listed under 46 CFR 7.1 and summarized above.

2. U.S. Territorial Sea

- a. On 28 December 1988, the President of the United States, by virtue of his foreign relations authority and consistent with international law, proclaimed a 12 nautical mile territorial sea.
 - (1) The proclamation did not extend the contiguous zone.

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

- (2) The U.S. territorial sea extension applies to waters adjacent to the coasts of the Commonwealth of Puerto Rico, Guam, American Samoa, U.S. Virgin Islands, Commonwealth of the Northern Mariana Islands and any other territory or possession over which the United States exercises sovereignty.
- b. Effect upon Coast Guard enforcement activities. This proclamation extended the territorial sea only for international purposes and did not alter Coast Guard law enforcement activities. The proclamation did not change existing Federal and State laws.
 - (1) The statutory definitions and applications of jurisdictional terms such as "territorial seas," "territorial waters," "navigable waters," and other similar terms remain unchanged unless legislation is enacted to change a specific law.
 - (2) For the purposes of enforcing U.S. domestic laws, the U.S. territorial sea is 3 nautical miles, the outer limit of the U.S. contiguous zone is 12 nautical miles, and the meaning of U.S. customs waters is unchanged. Accordingly, congressional action is necessary to extend the geographic application of a State or Federal law beyond 3 nautical miles.

**D. INTERNATIONAL CONVENTIONS AND TREATIES RELATED TO MARINE
INSPECTION TO WHICH THE U.S. IS PARTY**

The International Maritime Organization (IMO) is a specialized agency of the United Nations concerned solely with maritime affairs. There are approximately 160 member nations in IMO, including the United States. IMO is responsible for international conventions, treaties, and resolutions to improve maritime safety. The organization consists of an Assembly, a Council, a Secretariat, and five specialized committees. The committee that proposes standards for steering and other technical matters is the Maritime Safety Committee, which meets twice a year. Countries that are party to international conventions and treaties are listed in MSM Volume I, Administration Management, COMDTINST M16000.6 (series), Chapter 11. For information on specific international conventions, treaties, standards, and regulations, see MSM Volume II, Materiel Inspection, COMDTINST M16000.7a (series), Section E.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

1. International Convention For The Safety Of Life At Sea (SOLAS), 1974

- a. The International Convention For The Safety Of Life At Sea (SOLAS), 1974, became binding upon the United States on 25 May 1980.
 - (1) The Convention contains standards and procedures affecting the inspection of certain passenger vessels and cargo vessels making international voyages.
 - (2) The 1978 Protocol to SOLAS 74, adopted by the International Conference on Tanker Safety and Pollution Prevention, modified the original Convention and became effective on 1 May 1981; together they are known as SOLAS 74/78.
- b. Convention requirements. For the most part, the inspection requirements of the Convention, with the exception of radio equipment requirements, have been or are in the process of being incorporated into CFR Title 33 and 46
- c. Thorough knowledge of the Convention's terms is essential to understanding the regulations. For additional guidance on this Convention, see MSM Volume II, Materiel Inspection, COMDTINST M16000.7a (series), Chapters E2, D1, and D7.

2. International Convention on Load Line (ICLL), 1966

- a. General. The International Load Line Convention (ICLL) contains standards for determining loading limits for vessels, the structure of vessels, protection of openings, guard rails, freeing ports, and means of access to crew's quarters. The ILLC has been incorporated into 46 CFR Subchapter E.
 - (1) The ILLC requirements are administered for the Coast Guard by the American Bureau of Shipping (ABS). Other assigning authorities have not been approved by the Commandant except for uninspected fish processing vessels.
 - (2) The MSM Volume IV, Technical, COMDTINST M16000.9 (series), describes the responsibilities of the OCMI and inspection personnel.
- b. Vessel Load Line Amendments of 1986. A double standard has existed since 1968 when the ICLL changed to a length criterion of 79 feet while the 1935 Coastwise Loadline Act remained based on a tonnage criterion of 150 GT. On 21 October 1986, the Omnibus Reconciliation Act of 1986 (Public Law 99-509) was enacted. This included provisions to revise and consolidate laws related to load lines.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

- (1) The Omnibus Reconciliation Act of 1986 brought all vessels under the requirements of the International Voyage Load Line Act of 1973, except in those cases where the additional requirements would not be justified for reasons of safety. The public was given ample opportunity to address implementation of the new law as it may have impacted the provisions of existing regulations and policies. Although certain existing provisions may appear to be eliminated by the new law, many could be continued under the special exemptions provision under 46 U.S.C. 5108.
- (2) The Omnibus Reconciliation Act of 1986 applied to ships 79 feet or more in length on international or domestic voyages, a change from the 150 GT criterion for domestic voyages.
 - (a) Since 1968, vessels of 79 feet or more in length on international voyages have been required to have a load line.
 - (b) New vessels which are 79 feet or more in length, under 150 GT, and on domestic voyages may be assigned a load line, but are not required to have one until the implementing regulations are promulgated.
 - (c) Existing vessels on domestic voyages are subject to load line requirements based on tonnage.
- (3) Until the regulations are amended to conform to the new law, the existing regulations will continue in effect.
 - (a) Previously published policies based on the old regulations or the old law in the MSM and elsewhere will also remain in effect.
 - (b) Additionally, existing limited domestic voyage approvals allowed by local policy, whether or not they are currently in the regulations, may continue in effect.
 - (c) When the new regulations are promulgated and in effect, all vessels on domestic voyages which were built after 1 January 1986 will have to comply with the load line requirements except as specifically exempted. Any existing policies that are discontinued by the rulemaking could, under the new law, also result in certain requirements being applied retroactively to existing vessels.
 - (d) Questions regarding load line application and enforcement should be directed to Commandant (CG-CVC).

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

3. International Convention for the Prevention of Pollution from Ships, 1973 as modified by the 1978 Protocol (MARPOL 73/78)

- a. General. The principal object of the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the 1978 Protocol (MARPOL 73/78) is the protection of the marine environment from pollution arising from the deliberate, negligent, or accidental release of oil and other harmful substances. Most of the technical measures, including the requirements for vessels and reception facilities, are included in six annexes to this Convention, as follows:
- (1) Annex I - Oil.
 - (2) Annex II - Noxious Liquid Substances Carried in Bulk (e.g., chemicals).
 - (3) Annex III - Harmful Substances Carried in Packages.
 - (4) Annex IV - Sewage.
 - (5) Annex V - Garbage.
 - (6) Annex VI – Air Pollution.
- b. Annexes I and II. The Act to Prevent Pollution From Ships (33 U.S.C. 1901 et seq.) is the implementing U.S. legislation for MARPOL and Annexes I and II. Annex I entered into force on 2 October 1983 and Annex II entered into force on 6 April 1987.
- c. Annexes III through VI. These are optional, i.e., a government may, at the time of acceding to or ratifying the Convention, declare that it does not accept any or all of these Annexes. The United States has accepted Annex V, which came into force on 31 December 1988. Annex IV is not yet in force.

4. International Regulations for Preventing Collisions at Sea, 1972 (COLREGS)

The International Regulations for Preventing Collisions at Sea (COLREGS) are published in COMDTINST M16672.2, Navigation Rules, International - Inland. COLREGS prescribe the basic rules that control the behavior of vessels at sea to prevent collisions. Questions concerning the navigation rules should be directed to Commandant (CG-WWM).

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS****5. International Convention relating to Intervention on the High Seas in Cases of Oil Pollution Casualties, 1969**

This Convention affirms the right of a coastal nation to take all necessary measures on the high seas to prevent or mitigate the danger to its coastline or related interest from pollution by oil, or the threat thereof, following a maritime casualty. Such actions may only be taken after due consultation with appropriate interests, including the flag state(s) of the ship(s) involved, the owners of the ship(s) or cargoes in question, and, when circumstances permit, independent experts appointed for this purpose. Marine safety personnel may not conduct such interventions without the specific approval of the Commandant. A coastal nation that exceeds these measures is liable to pay compensation for any damages caused by its unilateral actions. The Convention contains provisions for the settlement of disputes through negotiation, conciliation, and arbitration. For further guidance, consult COMDTINST M16000.14 (MSM Volume IX, Marine Environmental Protection, COMDTINST M16000.14 (series)).

6. International Convention for Safe Containers, 1972

This Convention seeks to maintain a high level of safety of human life in the transport and handling of cargo containers, while facilitating their international use in intermodal transportation.

7. Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972

This Convention, commonly known as the "London Dumping Convention," promotes the effective control of all sources of marine pollution. It tasks party nations to take all practical steps to prevent pollution from dumping wastes and other matter liable to create hazards to human health, to harm living resources and marine life, or to interfere with other legitimate uses of the sea. The Marine Protection, Research, and Sanctuaries Act of 1972 (MPRSA, 33 U.S.C. 1401 et seq.) was amended on 22 March 1974 to reflect the provisions of this Convention. MPRSA prohibits or controls the dumping of wastes and other matter, in whatever form or condition. The following is a summary of the key MPRSA requirements:

- a. The dumping of wastes or other matter listed in Annex I of the Convention is prohibited;
- b. The dumping of wastes or other matter listed in Annex II requires special prior permission; and

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

- c. In times of emergency, usually prohibited dumping may occur to secure the safety of lives, vessels, aircraft, or structures at sea.
-

8. Officers' Competency Certificates Convention, 1936

Every nation that is party to this Convention must establish minimum requirements of professional capacity for the master, chief engineer, and navigating and engineering officers in charge of watches aboard merchant vessels of that country, and must issue certificates of competency to qualified officers. This Convention has been implemented by statute and regulation in 46 U.S.C. 8304 and 46 CFR 15.701, respectively, for vessels of 200 GT or more.

9. Certification of Able Seaman Convention, 1946

This Convention requires persons serving as able seamen aboard merchant vessels of nations party to this Convention to be qualified to perform any duty in the deck department, and to possess certificates of qualification granted in accordance with the provisions of the Convention.

10. STCW 95

The International Convention on Standards of Training, Certification and Watchkeeping for Seafarers, 1978, as amended in 1995 (STCW 95) was adopted on 07 July 1995 and entered into force internationally on 01 February 1997. The major highlights of the 1995 amendments include the following: creation of the STCW Code, changes in tonnage limitations, certification and endorsements, rest periods, requirement of English proficiency, basic safety training, vessel familiarization, and company responsibility

NOTE: See MSM Volume II, Materiel Inspection, COMDTINST M16000.7B (series), Chapter D2, for guidance on exercising control under STCW Article X, and Regulation 1(4) and NVIC 3-98 for guidance on the STCW 95.

11. International Labor Organization (ILO) Convention No. 147

International Labor Organization (ILO) Convention No. 147, The Convention concerning Minimum Standards in Merchant Ships (ILO 147) was adopted at the 62nd session of the International Labor Conference on 13 October 1976. It entered into force internationally on 28 November 1981; upon the United States' deposit of its instrument of ratification, it

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

entered into force on 15 June 1989. ILO 147 serves as an umbrella convention for 15 other ILO conventions concerning a variety of maritime related health, welfare and workplace safety issues. ILO 147 concerns three basic areas: safety standards, including standards of competency, hours of work and manning; appropriate social security matters; and shipboard conditions of employment and shipboard living arrangements. A guidebook, *Inspection of Labour Conditions on Board Ship: Guidelines for Procedure* (ISBN 92-2-107096-4), may be obtained from ILO Publications, The International Labour Office, CH-1211, Geneva 22, Switzerland. See MSM Volume II, Materiel Inspection, COMDTINST M16000.7B (series), Chapter D2, for guidance on exercising control under ILO 147 Article 4 and COMDTINST 16711.12.

**E. PURPOSE OF MARINE SAFETY MANUAL, VOLUME II, MATERIEL INSPECTION,
COMDTINST M16000.7B (SERIES)**

1. Responsibility of the Marine Inspector

It is neither necessary nor possible to memorize the multitude of laws and regulations that the Coast Guard must enforce. However, it is incumbent upon, and the responsibility of, the marine inspector to have a working knowledge of both U.S. and international laws and regulations so that he/she can recognize a deficiency when one occurs and can quickly locate the statutory citation related to a particular requirement.

2. Content

The following chapters contain information and guidance intended to promote consistent interpretation and application of U.S. and international laws and regulations related to merchant vessel inspections. The regulations and the guidance contained in this volume are not intended to cover all contingencies that may be encountered during vessel inspections. This manual generally does not restate requirements that are specifically and clearly covered in the law, Federal regulations, or international conventions. There is no substitute for experience and sound judgment to ensure that good marine practice is being followed. In addition, any information in this volume may be supplemented, altered, or waived in specific cases by the Commandant, district commander, or OCMI. To that end, it is imperative that the OCMI maintain a current and complete library containing the applicable laws and regulations.

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

3. Other Guidance

This volume must be used in conjunction with other applicable instructions, notices, and publications such as Commandant Instructions, Law Bulletins, and Navigation and Vessel Inspection Circulars (NVICs). For easy reference, a list of recommended resources is included at the end of this chapter.

F. VESSEL INSPECTION POLICY

1. Inspections

The goal of vessel inspection policy is to protect individuals, their private property, and the marine environment from the consequences of incidents involving materially unsafe vessels. Generally, vessels are inspected while they are not engaged in navigation. However, at times it is more conducive to vessel owners and operators to schedule an in-water inspection, such as an inspection for certification or midperiod inspection, during a leg of a vessel's voyage. OCMI's should take advantage of underway inspections, as they allow the inspector to observe crew performance and witness the operation of a vessel's machinery and other equipment. The inspection of a vessel is intended to determine its reasonable, probable compliance with published minimum safety standards over a projected period of time. The issuance of a Certificate of Inspection (COI) attests to that reasonable probability.

2. Coast Guard Concerns

The Coast Guard's objective is to administer vessel inspection laws and regulations and promote safe, well-equipped vessels that are suitable for their intended service. It is not the Coast Guard's intent to place unnecessary economic and operational burdens upon the maritime industry. When determining inspection requirements and procedures, inspection personnel must recognize and give due consideration to the following factors:

- a. That the burden for proposing acceptable repairs rests upon the vessel's owner, not upon the repair facility or the inspector.
- b. That delays to vessels, which can be costly, need to be balanced against the risks imposed by continued operation of the vessel, with safety of life, property, and the environment always the predominant factors rather than economics.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

- c. That certain types of construction, equipment, and/or repairs are more economically advantageous to the vessel operator and can provide the same measure of safety.
- d. That some repairs can be safely delayed and can be more economically accomplished at a different place and time.
- e. That the overall safety of a vessel and its operating conditions, such as route, hours of operations, and type of operation, should be considered in determining inspection requirements.
- f. That vessels are sometimes subject to the operational requirements of organizations and agencies other than the Coast Guard.
- g. That a balance must be maintained between the requirements of safety and practical operation. Arbitrary decisions or actions that contribute little to the vessel's safety must be avoided.

3. Appeals and Waivers

Decisions made by the OCMI; the District Commander; the Marine Safety Center; a recognized classification society when acting on behalf of the Coast Guard; the National Maritime Center; Director, Great Lakes Pilotage; and vessel documentation matters may be appealed by the affected party as described in 46 CFR 1.03. Pursuant to the 2010 Coast Guard Authorization Act, Pub. L. 111-281, which amended Section 102 of Chapter 5 of Title 14, United States Code, the following section details the requirements for individuals involved in appeals and waivers:

Except for the Commandant of the Coast Guard, any individual adjudicating an appeal or waiver of a decision regarding marine safety, including inspection or manning and threats to the environment, shall—

- (1) be a qualified specialist with the training, experience, and qualifications in marine safety to effectively judge the facts and circumstances involved in the appeal and make a judgment regarding the merits of the appeal; or
- (2) have a senior staff member who—
 - (a) meets the requirements of paragraph (1);
 - (b) actively advises the individual adjudicating the appeal; and
 - (c) concurs in writing on the decision on appeal.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

Efforts to resolve any disagreements should always be made first at the local level. If agreement cannot be reached with the OCMI, the affected party should submit a formal appeal in writing as indicated in 46 CFR 1.03.

G. APPLICABLE TANK VESSEL REQUIREMENTS

When a vessel carries combustible and flammable cargoes in bulk, those portions of the vessel used for the carriage of these cargoes must also meet the requirements of 46 CFR Subchapter D (tank vessels). The following portions of 46 CFR Subchapter D apply to all vessels, if the vessel carries Grade D and above products.

1. 46 CFR 32.45 Electrical Installations

Refer to 46 CFR 32.45: Electrical Installations.

2. 46 CFR 32.50 Pumps, Piping, and Hose for Cargo Handling

Refer to 46 CFR 32.50: Pumps, Piping, and Hose for Cargo Handling.

3. 46 CFR 32.55 Ventilation and Venting

Refer to 46 CFR 32.55: Ventilation and Venting.

4. 46 CFR 32.60 Hull Requirements for Tank Vessels on or After July 1, 1951

Cargo piping and pump room requirements are especially significant. Cargo piping must comply with 46 CFR 32.50-15(a)(1) and 32.50-15 (3)(b) and (c). Cargo piping must not pass through machinery spaces. Combining this with the requirements of 46 CFR 32.60-20(a) necessitates a separate space for the cargo pump. The equipment in this space must comply with 46 CFR 32.45 and 111.105-31. A hazardous area drawing in accordance with 46 CFR 110.25-1(i) is required.

H. REQUIRED PUBLICATIONS

Chapter 2 of the Directives, Publications and Reports Index (DPRI) (COMDTNOTE 5600) lists the effective publications and periodicals that marine safety units must maintain.

I. RECOMMENDED REFERENCES

In addition to the publications listed in the DPRI, OCMIs should maintain the latest editions of pertinent international conventions and standards, industry standards and technical publications deemed necessary for reference and the proper training of personnel. The OCMi should obtain sufficient numbers and varieties of these publications to keep personnel abreast of the latest developments in ship operation, construction, repair, etc. The following publications are considered good reference and training materials that should be maintained, as necessary, based on the individual needs of a unit. In light of the Coast Guard's increasing acceptance of industry developed standards, OCMIs should place special emphasis on obtaining the specific standards listed either in the regulations or below.

1. A Guide to the Non-Destructive Testing of Non-Butt Welds in Commercial Ships, Parts I and II, Ship Structure Committee (SSC).
2. A Guide to Sound Ship Structures, D'Archangelo.
3. American National Standards Institute (ANSI) Steel Pipe Flanges and Flanged Fittings, ANSI B.16.5, American Society for Testing and Materials (ASTM).

NOTE: Various maintenance manuals published by the manufacturers of boilers, turbines, aluminum components, etc., are also useful resources.

J. UNITED STATES MARITIME ADMINISTRATION (MARAD)

The Merchant Marine Act of 1936 (46 App. U.S.C. 1101 et seq.), as amended by the Merchant Marine Act of 1970, states that it is United States policy to foster the development and encourage the maintenance of a merchant marine. The agency charged with implementing this policy is the U.S. Maritime Administration (MARAD). In September 1981, MARAD became an agency of the Department of Transportation. Liaison between MARAD and the Coast Guard is intended to promote attainment of the mutual goal of merchant vessel safety.

K. HAZARDOUS MATERIAL DETERMINATIONS AND AUTHORITY

The regulations for combustible and flammable liquids carried on a vessel fall under either or both of the statutes discussed in the following paragraphs. For greater detail on the carriage of hazardous materials, see MSM II, Materiel Inspection, COMDTINST M16000.7A (series), Section F.

USCG Marine Safety Manual, Vol. II: Materiel Inspection
SECTION A: MARINE INSPECTION ADMINISTRATION
**CHAPTER 1: AUTHORITY AND PROVISIONS FOR
MERCHANT VESSEL INSPECTIONS**

1. Hazardous Materials Transportation Act (HMTA) of 1974

The Hazardous Materials Transportation Act (HMTA) of 1974 can be found in 49 U.S.C. 1801-1812. For packaged material, the HMTA defines a hazardous material as "a substance or material that has been determined by the Secretary of the Department of Transportation (SECDOT) to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce, and which has been so designated" (see 49 CFR 171.8). This is a very broad definition and includes many commodities that may not be allowed for shipment in bulk.

2. 46 U.S.C. 2101

For the purpose of bulk transportation, Title 46 U.S.C. defines a hazardous material as any liquid material or substance that is:

- a. Flammable or combustible;
 - b. **Designated a hazardous substance under Section 311(b) of the FWPCA**, as amended (33 U.S.C. 1321); or
 - c. Designated a hazardous material under Section 104 of the HMTA (49 U.S.C. 1803).
-
-

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS**A. ASSIGNMENT OF MARINE INSPECTORS**

1. Introduction

Many factors have a bearing on the number of inspectors that are assigned to an inspection. One inspector (either deck or engineering) is usually sufficient to inspect small vessels such as tank barges, seagoing barges, or small passenger vessels. Larger vessels or those requiring an accelerated inspection may require two inspectors (deck and engineering) and perhaps more, as the need arises. The number and technical qualifications of inspectors necessary to conduct an adequate inspection or examination is at the discretion of the Officer in Charge, Marine Inspection (OCMI).

2. Training and Experience

Every inspector is considered either a deck inspector or an engineering inspector. The OCMI should ensure that all inspectors are cross-trained, within the limits of their capabilities, to serve in both capacities. Thus, an engineering inspector will normally be expected to be capable of making examinations such as the checking of repairs to a lifeboat. A deck inspector will likewise be expected to be capable of making simple engineering examinations, such as checking a fire pump.

3. Overseas Inspections

The United States is routinely asked to conduct inspections in overseas locations where our inspectors may be exposed to potential threats to their physical security. Coast Guard inspectors are easily identified as Americans and, if identified as Coast Guard officers, easily associated with the military. Although we have a responsibility to U.S. ship owners and operators and seafarers to carry out our commercial vessel safety mission, we are also responsible for ensuring the safety of our people. OCMI's must also keep in mind the potential impact that overseas inspection decisions may have on both local and national policy. Sector and Activity Commanders should follow the procedures outlined below when responding to requests for overseas inspections.

- a. Requests for overseas inspections. Requests for overseas inspections should be routed within each office at a sufficiently high level to address the policy issues involved.
- b. General requests. General requests inquiring whether the Coast Guard is sending inspectors into certain areas should be answered carefully to ensure that the

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

response does not include a statement that the Coast Guard is not traveling to a particular country. This can, and has, caused political consternation both within our government and with foreign governments. Responses to this type of general request should contain statements to the effect that no general Coast Guard travel bans exist and that inspector availability and assessment of the threat to personnel is done on a specific, case-by-case basis.

- c. Threat assessment. The latest threat assessments should be reviewed when considering requests to conduct inspections of specific ships or in specific areas. To obtain these, contact district (oil), the International Affairs Office at Coast Guard Headquarters.
- d. The State Department also issues travel advisories for U.S. citizens. The Citizens Emergency Center at the State Department in Washington, D.C. provides general information on possible danger areas for U.S. citizens around the world. They may be contacted at (202) 647-5225.
- e. Message notification. If a preliminary decision is made to send an inspector overseas, then the OCMI must request country clearance from the cognizant U.S. Embassy or Consulate by message in accordance with COMDTINST 5000.5E.
- f. The message must include the name of the inspector, the dates of travel, the purpose of the travel, a statement regarding whether assistance by post officials is/is not envisioned, and the name, position title, and telephone number of a contact person. See Figure 2-1 for the required message format and wording.

INFO: USDAO OTTAWA CA

NOTE: Coast Guard Personnel are EXEMPT from obtaining DOD Special Area Clearance.

- g. Overseas examinations of foreign vessels. Title 46 U.S.C. 3317 authorizes the Coast Guard to be reimbursed for examinations of foreign vessels conducted at foreign ports or places at the request of the owner or managing operator of the vessel.
- (1) Based on this authorization, the Coast Guard conduct those overseas examinations on foreign vessels which will prove most beneficial to our Port State Control efforts while conserving time and resources.
 - (2) Activities which may warrant overseas travel include initial control verification exams of passenger vessels and examinations of other vessels of particular interest due to their unique design or type of cargo carried (e.g., liquefied gases). Most other foreign vessel exams will be conducted in U.S. ports.

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- (3) Field units which receive requests for overseas examinations of foreign vessels must contact Commandant (CG-CVC-2) for approval. Commandant (CG-CVC-2) will evaluate the request, and, if it is approved, will coordinate/organize any augmentation teams necessary to assist the field unit to perform the examination.
- h. Denial of overseas inspection request. If a preliminary decision is made not to send an inspector, Commandant (CG-CVC-2) should be notified before any further action is taken. Commandant (CG-CVC-2) will contact the cognizant Coast Guard offices to ensure that all available information has been considered, and then advise the OCMI of any new information that bears on the preliminary decision. Responsibility for the final decision rests with the OCMI. Commandant (CG-CVC-2) must be advised of the final decision.
- i. Inspector's responsibilities. When traveling overseas, the inspector should make his or her own travel arrangements directly with transportation carriers. The use of foreign carriers is also permitted to obtain indirect routing around high risk areas.
- (1) Inspectors may use their own means of payment or a Government-issued credit card issued under the Travel Charge Card Program to facilitate overseas ticketing.
- (2) Currently, these government-issued credit cards indicate that the holder is an employee of the U.S. Government. For this reason, inspectors should use discretion with this card.
- (3) Cognizant OCMI should ensure expeditious reimbursements of expenses with the district travel office in accordance with the Joint Travel Regulations.
- j. Reporting of overseas inspections. Marine Safety Information System (MSIS) reports for inspections conducted overseas must have the proper country code indicated in the appropriate field of the Marine Inspection Activity Report (MIAR).

4. Performance of Reimbursable Overtime by Civilian Marine Inspectors

Depending on workloads and the availability of trained personnel, it may, at times, be necessary to assign civilian marine inspectors to duties that may involve the payment of overtime compensation.

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- a. Computation for services. 46 U.S.C. 2111 is to be used for computing overtime compensation for services performed after hours, on Sundays, and on holidays. Saturdays are considered normal work days. Overtime, other than that specifically provided for in Title 46, is computed according to 5 U.S.C. 5542.
- b. Reimbursements from industry. Reimbursements from industry for overtime services by civilian inspectors are not to be viewed as an offset to the district's civilian overtime ceiling. 46 U.S.C. 2111 requires that overtime is paid to the employee out of annual appropriations and that reimbursements from industry are deposited in the U.S. Treasury. Rather than sidestepping the district's civilian overtime ceiling, the provisions of the statute will actually cause the overtime account to be drawn down more rapidly as payments to civilian documentation officers and inspectors are considerably more generous than those paid to other employees.
- c. Availability of district funding. Presently, there are no means by which the Coast Guard may recover the deposits of overtime reimbursements from the Treasury. This may create a problem when overtime funding is no longer available at the district level. Until a means is established to recover the reimbursements deposited in the Treasury to supplement the overtime ceilings, Commandant (G-MOC) should be contacted regarding the possibility of providing program funds to cover overtime expenses for the purpose of preventing any disruption in our services.
- d. Assignment of civilian inspectors. When assigning civilian inspectors, OCMI's should exercise care to ensure that the same companies are not repeatedly burdened with the extra cost while others escape the added expense altogether. This will avoid the appearance of unfairly treating any particular party. Also, a written acknowledgement must first be obtained from the vessel operators that they will reimburse the Government for overtime costs.

B. Regulations

The marine inspector is bound to encounter situations in which regulations that seem applicable are actually inappropriate for the situation or not in the best interest of overall safety. During the inspection of a vessel, an inspector must take care to ensure that each regulation being applied is relevant to the vessel and situation. Inspectors should be alert to such situations. Before requiring changes based on such a judgment call, an inspector should seek advice from the Chief, Inspection Division (CID), the Chief, Prevention Department (PDH) or the OCMI. When in doubt, the OCMI should request advice from the District Commander (or the Commandant, via the chain of command).

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS**C. INSPECTION DEFICIENCIES**

The guidance outlined below is not intended to provide detailed instruction on how to use the MISLE database. The MISLE Portal page (<https://cgportal2.uscg.mil/communities/misle/SitePages/Home.aspx>.) and various TRACEN Yorktown Marine Inspection “C” Schools are designed to provide user guides and various levels of training on the specific uses of MISLE.

Marine inspectors should follow the guidance provided in the CG-CVC-1 Mission Management System (MMS) work instruction for properly documenting deficiencies in MISLE. This instruction is located on the MISLE Portal page under the MISLE User Guides tab.

1. Definition

A deficiency is any failure to meet minimum requirements of the vessel inspection laws or regulations. An item (equipment, system, component, or structure) is considered deficient if:

- a. It is presently unsatisfactory to the inspector; or
- b. It has a reasonable possibility of becoming unsatisfactory prior to the next required inspection (COI, annual, periodic or hull examination).

2. Notice of Deficiency Using Vessel/Facility Inspection Requirements, Form CG-835

- a. If, during the course of any vessel inspection or examination, the vessel or its equipment is found not to comply with the requirements of vessel inspection laws or regulations, the inspector should point out the deficiencies and discuss all required corrective actions with the vessel's owner or the owner's representative.
 - (1) When necessary, depending on the seriousness of the deficiency, the inspector should explain that failure to correct the deficiencies before completion of the inspection or examination may result in refusal to issue, or withdrawal, of the vessel's Certificate of Inspection (COI).

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- (2) The marine inspector should advise the vessel owner/representative that they may speak to the OCMI about any deficiency that will not be corrected by the date specified on the deficiency report. Depending on the nature of the deficiency, the OCMI may then decide whether or not to extend the compliance deadline.
 - (3) When authorized by the OCMI, deferment of correction of minor deficiencies may be settled by discussions between the vessel owner/representative and the inspector. If the owner or his or her representative desires further clarification or reconsideration of any requirements, that person should consult the OCMI.
 - (4) Deficiencies that may affect the vessel's seaworthiness, are unusually complex, or may indicate a problem with a system or item on other vessels, shall be entered into MISLE as soon as possible. Deficiencies must be entered in MISLE even if they were corrected prior to the end of the inspection. Entering corrected deficiencies allows for the effective use of the safety performance tracking capability afforded by MISLE.
- b. The master/representative of the vessel must be notified of any deficiencies the marine inspector finds. Other officers with primary interest in the inspection, such as the chief mate or chief engineer, should also be kept fully informed, even though a port engineer or other owner's representative may be more directly concerned with correction of the deficiencies.
- (1) The inspector's notification of the deficiency may be verbal or in writing, as circumstances dictate (see A2.C.3 below). Written notification of the requirement to correct a deficiency shall be on Vessel/Facility Inspection Requirements, Form CG-835, IAW 46 CFR 2.01-10.
 - (2) The original copy of Vessel/Facility Inspection Requirements, Form CG-835 should be issued to the vessel's master or, if not available, to either the chief engineer or the owner/representative. If issued to the owner/representative, that person's capacity with respect to the vessel (title), should be noted on the form.
- d. When a vessel is permitted to depart with outstanding deficiencies following an inspection, the inspector shall ensure the time period for correction of those deficiencies is clearly annotated on the CG-835 form. The inspector shall ensure that outstanding deficiencies and any corrected deficiencies that may have directly affected the seaworthiness of the vessel, are entered into MISLE as soon as possible.

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- (1) On subsequent visits to the vessel, inspectors shall determine the status of any outstanding requirements by reviewing the vessel's record of deficiencies in MISLE prior to boarding the vessel. If there is a question regarding any outstanding requirements, the issuing office should be contacted. Deficiencies from prior exams should be cleared if they are corrected, or reissued with a new compliance date.
- (2) Whether deficiencies are corrected or not, the witnessing inspector must make explanatory entries for each deficiency with the port, date, and his or her signature on the Vessel Inspection Record. MISLE should then be updated and the issuing office will be notified automatically by MISLE.
- (3) Monthly reports should be pulled to ensure there are no outstanding requirements issued from your office.

3. When to Issue Vessel/Facility Inspection Requirements, Form CG-835

- a. Notice of Vessel/Facility Inspection Requirements, Form CG-835 must be issued to cover outstanding deficiencies in the following cases:
 - (1) When it is apparent that the correction of a deficiency may be subject to controversy between the ship owner or operator and the Coast Guard.
 - (2) When it is desirable to make exact requirements a matter of record.
 - (3) When some deficiencies have not been corrected by the end of the inspection and are permitted to remain outstanding.
 - (4) When deficiencies have not been corrected before the vessel proceeds to another inspection zone for completion or continuation of an inspection.
 - (5) When it is anticipated that an inspection will be completed by another inspector.
 - (6) When the owner's representative requests a written requirement to cover items considered by the inspector to be deficiencies.
- b. When deficiencies are not controversial and corrective action is being taken, the inspector may use discretion in determining whether or not to issue them on a CG-835 form. However, the deficiencies should still be documented and entered into MISLE so the data can be used to identify trends in the future. Written

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

requirements on form CG-835 should not be issued at the request of the owner's representative or a crewmember to cover repairs or changes initiated by the owner when such repairs or changes would not have been required by the inspector. However, when such repairs or changes are undertaken, they must be accomplished to the satisfaction of the inspector.

4. How to Write Deficiency Requirements

- a. Inspectors should exercise special care when writing requirements to correct deficiencies.
 - (1) The master should be notified, in clear and concise language, of the nature of a deficiency and the steps that must be taken to correct it.
 - (2) Unless statutes, regulations, instructions, or established marine practice dictate otherwise, the method of correction should be left to the discretion of the owner or the owner's representative, subject to the inspector's approval.
- b. Basis for requirements. Vessel/Facility Inspection Requirements, CG-835 requirements should be based on specific regulatory requirements. Where the regulations allow, requirements may be based on the discretion of the OCMI. Requirements should be clearly worded so that the master, chief engineer, or owner will understand the deficiency to be corrected. Requirements that cannot be supported by regulations or definitive OCMI policy should not be issued.
- c. Completeness. Each written requirement should clearly describe the deficiency and include the required corrective action (e.g. repair in kind, prove proper operation). Requirements will normally have completion dates based upon policy established by the OCMI.
 - (1) The inspector should avoid vague statements, such as "Bring into compliance with 46 CFR."
 - (2) A statement of the inspector's authority (law or regulation) is not necessary on Vessel/Facility Inspection Requirements, Form CG-835 unless specifically required by the OCMI. However, when a particular law or regulation contains information that might clarify the terms of the requirements or suggest alternate means of compliance, reference to such sources may be made. It is recognized that requirements may be written under conditions requiring haste or circumstances where reference to authorities is not feasible.

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- d. Local modifications. In some inspection zones, standard wording has been adopted for frequently recurring requirements on Vessel / Facility Inspection Requierments, Form CG-835. This practice has proven to be advantageous to inspectors and vessel owners and operators, particularly in the inspection of small passenger vessels.
-

5. Notations in Inspection Reports

Refer to MSM Volume II, Material Inspection, COMDTINST M16000.7A (series), Chapter A3 for instruction on making notations in inspection reports.

6. Letters of Outstanding Deficiencies

- a. Deficiencies may remain outstanding at the completion of an inspection or examination provided that they are not contrary to law, and, in the OCMI's opinion, they will not materially affect the safety of the vessel or the environment during the time they remain uncorrected. These deficiencies will normally fall into the following categories:
- (1) Minor requirements, such as those for signs or small repairs, that can be readily accomplished by the ship's crew.
 - (2) Relatively minor items of equipment that are not then available but have been placed on order.
 - (3) Repairs that can be safely postponed and accomplished where those interested can most conveniently perform them.
 - (4) Deficiencies that remain outstanding when a vessel moves from one zone to another to complete an inspection.
 - (5) Deficiencies that can be more readily corrected when the vessel is in drydock.
 - (6) Deficiencies on vessels being laid up and placed out of operation.
 - (7) Deficiencies that are being appealed.
- b. Notification procedures. Upon completion of the inspection or examination, all deficiencies for which a Vessel/Facility Inspection Requirements, CG-835 was issued must be entered into MISLE.

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- c. Extensions of time. Time limits for deficiency corrections may be extended for good cause by the issuing OCMI, the district commander, or the Commandant. The time limit on a deficiency should not normally be extended by another OCMI or district commander without the agreement of the OCMI who issued the requirement. In no case should a requirement be modified or cancelled by a person other than the issuing OCMI.

7. Deficiencies Reported by the Crew

- a. General. All licensed officers are required by 46 U.S.C. 3315 to assist the marine inspector and to point out all known defects and imperfections. Inspectors should ask the master and chief engineer about deficiencies and should be receptive to all reports of deficiencies made by the ship's officers and crew.
- (1) Each reported deficiency should be investigated and corrective action required when appropriate. The inspector should include a note concerning each complaint of deficiency in the inspector's report.
 - (2) Inspectors should be aware that 46 U.S.C. 3315 prohibits the disclosure of the sources of information about deficiencies.
- b. Approaches from safety committees. Many vessels have safety committees under company or union sponsorship that meet regularly to consider safety matters. Almost all of these, particularly where materiel items are involved, are of concern to the Coast Guard.
- (1) It is likely that inspectors will be approached by spokespersons of ships' safety committees, either verbally or by written petition. When such contact is made, the inspector must note those matters and inform the OCMI of the complaints and actions taken.
 - (2) This is necessary because copies of complaints are often forwarded to various officials, including the Commandant and members of Congress. The Commandant may then contact the OCMI for additional information.
-

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS**8. Condemning Equipment in Use**

- a. OCMI should not condemn or impose additional or different requirements on approved equipment or other inspection items that another OCMI has passed or accepted, except in the following cases:
 - (1) When deficiencies exist and were undiscovered due to inspection errors or omissions.
 - (2) When the item has since been damaged or has otherwise deteriorated to such an extent that it is no longer fit for the service intended.
 - (3) When the requirements of law or regulation have changed and the change is retroactive.
 - (4) When the route or service of the vessel is being changed, or alterations are being made to the vessel that make changes necessary for compliance with different regulations.
 - (5) When directed by the Commandant.
 - b. Resolution of disputed approvals. When an OCMI considers equipment or other inspection items previously approved by the Commandant or an OCMI to be unsuitable because of workmanship, arrangements, or design, the OCMI should attempt to resolve the matter between themselves.
 - (1) If the problem cannot be resolved, no further action should be taken until a decision has been made by the cognizant district commander(s).
 - (2) When district commanders cannot reach agreement, the matter should be referred to Commandant (CG-CVC).
-

9. Deficiencies Overlooked at Prior Inspections

Deficiencies that were overlooked, by error or omission, during a previous inspection or by previous inspectors during the same inspection should normally be required to be corrected. The inspector should consult previous inspection records and contact the previous inspectors to determine the status of the item(s) in question. The current inspector should ensure that the item has not been previously approved or accepted as satisfactory before making additional requirements. The vessel owner should be given all possible consideration in the correction of items found to be deficient because of

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

inspection errors or omissions. Unless immediate correction of such items is considered critical to the safety of the vessel, the OCMI should allow a reasonable amount of time for their correction.

10. Changing of Inspectors During Inspections

Changing inspectors during an inspection should be avoided. When circumstances require such a change, there must be a clear understanding between the inspectors concerning approved items and outstanding deficiencies. Proper use of the Inspection Book, CG-840 and Vessel/Facility Inspection Requirements, Form CG-835 will facilitate this understanding. The relieving inspector should not change requirements imposed by the first inspector or impose additional requirements concerning items previously approved or accepted as satisfactory, unless the relieving inspector has received authority from the OCMI; Chief, Prevention Department; or the CID. These officers should confer with the first inspector before authorizing a change in requirements or imposing additional requirements.

11. Resolution of Requirements Between Inspection Zones

- a. General procedures. When a vessel changes inspection zones during an inspection, or when any deficiencies issued by one OCMI may be completed in another zone, the requirements issued by the first OCMI must be passed to the next OCMI. If a vessel changes its home port or primary port of operation to another zone, the OCMI should ensure that any outstanding inspection cases are filed and that deficiencies are entered into MISLE.
- b. Monitoring procedures. OCMI's must ensure that any deficiency requirements issued in another zone are completed. The OCMI who issued the notice of deficiency and the OCMI who last certificated the vessel will be notified automatically by MISLE that the requirements have been satisfied.
 - (1) Additional requirements should not normally be imposed on a vessel approved in one zone when it moves to another zone for a similar operation and route.
 - (a) When there is disagreement between OCMI's as to deficiencies or requirements, the matter should be referred to the district commander(s) for resolution.
 - (b) If the district commander(s) cannot reach agreement, the matter should be referred to Commandant (CG-CVC).

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS

- (2) Unless the situation is extremely hazardous, additional requirements should not be imposed before the matter is resolved. When an OCMI finds it necessary to change or impose additional requirements because of hazardous conditions, he or she should notify the first OCMI, the district commander(s) and Commandant (CG-CVC) by phone or email.
- c. Transfer of records. When previous inspection records will help resolve questions concerning a vessel inspected in another zone, the OCMI should obtain a copy of such records.

D. SPECIAL CONSIDERATIONS

1. Introduction

The vessel inspection regulations include provisions for special actions and considerations for certain circumstances. In many cases, the Commandant or district commander holds the discretion to give special consideration. In some cases, the OCMI is given this authority and may further delegate the authority to inspectors. Other regulations authorize the inspector to make discretionary rulings on matters within the limits of unit policy. Provisions for special consideration should be used to provide practical application of the regulations and avoid unreasonable requirements, actions, or decisions unnecessary to maintaining an adequate degree of safety. This policy applies only to those regulations that expressly authorize these special provisions, i.e., 46 CFR 30.15, 70.15, 90.15, 108.105, 175.15, and 188.15.

2. OCMI's Role

Certain sections of the small passenger vessel regulations in 46 CFR Subchapters T and K authorize the OCMI to permit departures from specific requirements when warranted by special circumstances or arrangements. OCMI's must recognize that local practices have often proved safe and appropriate for local conditions, even if they do not conform specifically to regulations.

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS**3. Inspector's Role**

In their inspection reports, marine inspectors should note all items that require interpretations of regulations, and on which the OCMI, district commander, or the Commandant has given an interpretation or decision. Such items include equivalents, substitutions, acceptance of non-approved equipment, non-standard fuel tanks, certain marine engineering items, etc. Inspectors should also enter a note in MISLE to document the decision for future reference.

E. MAINTENANCE OF VESSEL INSPECTION RECORDS

1. Required Records

46 U.S.C. 3310 requires the Coast Guard to keep adequate inspection records. The OCMI should ensure that records of all actions pertaining to vessel inspection are maintained as required. Directives and file systems should be maintained in accordance with the Coast Guard Directives System, Commandant Instruction (COMDTINST) M5215.6 (series) and COMDTINST 5210.5 (series). Inspection records and files should be retained, destroyed, or transferred as required by the Paperwork Management Manual, COMDTINST M5212.12. (See Chapter 3).

2. Transfer of Records Between OCMI's

The inspection records covering the initial construction and inspection of all vessels, except those inspected under 46 CFR Subchapters T and K, must be maintained by the OCMI conducting the initial inspection, subject to the disposal instructions in COMDTINST M5212.12. With the exception of the vessels noted in the following paragraph, all current records, except those for the initial inspection, must be transferred to the zone where a vessel transfers its principal port of operation. Vessels inspected under 46 CFR Subchapters T and K should also have their initial inspection files transferred to the OCMI of the zone in which the vessel currently operates. When a vessel's principal area of operation shifts from one zone to another, its files must be transferred permanently from the first OCMI to the OCMI of the vessel's new zone. In the case of a vessel that has temporarily shifted principal zones of operation, the files should be temporarily transferred when they are needed to resolve inspection questions. When transferring original files, the transferring office must retain copies in the event of mail loss or damage. Further, the receiving OCMI should ensure the vessel is added to the unit's Fleet of Responsibility (FOR) in MISLE.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 2: ADMINISTRATION OF MERCHANT VESSEL INSPECTIONS**3. Certified Copies of Inspection Records**

- a. At times, certified copies of inspection records will be needed for court proceedings. These certified copies may be made by a photographic copying process, or by copying the record word for word when the record consists of entries on a form and the same type of form is available. The copy requiring certification should be certified by the OCMI (or acting OCMI) in a manner similar to the following (any questions concerning certification should be referred to the district legal officer):

“I hereby certify that the attached is a true copy of the original record of inspection covering the inspection of the SS WHIZZ between 8 and 12 May 1985, on file in my office, and of which I am the custodian.

Signed and dated at Philadelphia, PA this 15th date of May, 1985.

(Signature)

By John Doe, Captain, U.S. Coast Guard
Officer in Charge, Marine Inspection
Philadelphia, PA.”

- b. Certification of copies. If practical, the certified copy should be stamped with the Coast Guard seal.
- (1) The certification must be attached to the record. It is not necessary to certify each page of an inspection report.
 - (2) Instructions with regard to charges for certification of documents are contained in 33 CFR 1.25 and 49 CFR 7.91. For policy concerning the release of investigative records to a court, see MSM Volume V, Investigations and Enforcement, COMDTINST M16000.10A (series).
 - (3) See Figure A2-2 for a sample certification of true copy.

FIGURE 2-2

CERTIFICATE OF TRUE COPY

(To be included in future revision)

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**A. VESSEL INSPECTION REPORTS AND RECORDS**

1. Standard Forms

Standard inspection record and report forms, whether manually typed or generated through the Marine Information for Safety and Law Enforcement (MISLE), are the primary media for transmitting information from the marine inspector to the Officer in Charge, Marine Inspection (OCMI). The OCMI is legally responsible for the certification of vessels. These standard inspection record and report forms should--

- a. Eliminate or reduce the collection and duplication of unnecessary information;
 - b. Provide uniform guides that may be modified to accommodate local conditions and needs for administration or for a particular inspection; and
 - c. Serve as the permanent record of inspections and certifications.
-

2. Use of Standard Forms

Due to the variety of vessel types and inspection requirements, it is important that the inspection forms do not limit or otherwise delineate the scope of an inspection. OCMI's are vested with the authority to modify the use of standard forms in order to meet local needs. For such modifications, the OCMI should maintain the primary objective of reducing the paperwork load on both the inspectors and the clerical staff. Practices to eliminate or reduce paperwork that are prohibited by instructions governing the use of forms must not be used.

B. VESSEL INSPECTION DOCUMENTS

This chapter also provides guidance to standardize entries on inspection documents that are issued to and maintained on board commercial vessels. To avoid potential problems from time lags in recording inspection data, a MISLE activity must be opened at the start of every vessel inspection rather than when the inspection is completed. This will assist vessel file users to determine if a required inspection is past due or has been undertaken in another OCMI zone. At a vessel's initial inspection for certification, the inspector should review all pertinent MISLE products to ensure that all information that should appear on the Certificate of Inspection (COI) and other documents is obtained for entry into MISLE. At each subsequent annual, periodic, drydock/hull exam, or inspection for certification, the inspector should review the COI and other vessel documents to verify their accuracy. The inspector should ensure that any changes that have occurred, such as change in owner or operator, propulsion, operating area, etc., are properly documented prior to the issuance of either an amended or new COI, or other documents.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**C. VESSEL INSPECTION DOCUMENTATION**

1. General Discussion

The accuracy and completeness of inspection reports is vital. These reports serve as public records of vessel inspections and reflect upon the professionalism of the inspector, the marine inspection program, and the Coast Guard as a whole. A MISLE activity is required for all inspections. Inspectors should follow the provisions of this section when preparing optional inspection booklets, CG-840, available on the CG Portal at the Commandant (CG-CVC) Web site. To help document inspection activities, use of the most recent version these booklets is encouraged.

2. Use of Booklets

Each 840 booklet is set up in outline form to serve a memory-jogging tool with appropriate reference citations. The booklets are considered job aids; however, the inspector may use a booklet as a draft record of the items checked during an inspection for later transfer to MISLE. The booklets were developed to be as complete as possible, with the goal of covering all items that should be examined during a particular inspection. However, the booklets may not encompass all facets of a particular vessel. Inspectors are cautioned against relying only on the items listed in a booklet in order to conduct a thorough inspection (see other chapters in this manual for further guidance in carrying out the various types of inspections).

3. Merchant Marine Inspection Requirement Form CG-835

Vessel/Facility Inspection Requirements, Form CG-835 is used to record all vessel conditions, equipment, or materials that do not comply with the requirements of statutes, regulations, or "good marine practice." See MSM Volume II, Materiel Inspection COMDTINST 16000.7 (series), Chapter A2 for additional guidance on the issuance of this form. Copies of all issued Vessel/Facility Inspection Requirements, Forms CG-835 should be included with the MISLE activity documentation and filed in the vessel's "hard copy" file.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- a. Outstanding deficiencies issued on Vessel/Facility Inspection Requirements, Form CG-835. Outstanding deficiencies issued on Vessel/Facility Inspection Requirements, Form CG-835 must also be entered in MISLE.
- (1) A numbered block in an inspection booklet should not be initialed if an item is unsatisfactory. In such cases, the inspector should describe the deficiency on the blank page opposite the item, with the date of the entry.
 - (2) If the deficiency is corrected prior to completion of inspection, the numbered block may then be initialed, but the deficiency must still be entered into MISLE.
 - (3) If the item is not completed satisfactorily before completion of the inspection, and a requirement is issued on Merchant Marine Inspection Requirement Form CG-835, this should likewise be noted on the page opposite the item.
- b. Partially completed items. Partially completed items should either be noted in the 840 booklet or in the inspection narrative in such a way that the status of each item can be easily understood by other inspectors.
- c. Remarks. The inspector must make any remark entries in the “Remarks” inspection narrative section (including inspection narrative) for each inspection visit to a vessel.
- d. Inspectors are encouraged to use a personal notebook or working copy of the CG-840 booklet to record daily remarks on inspections that last several days, weeks, or months. This will assist the inspector in drafting the final narrative summary at the conclusion of the inspection. Personal notebooks are the property of the individual inspector and need not be retained, submitted for review, or included in the official record.
- e. Duplication in the inspection narrative of the check-off blocks in the Inspection Books, CG-840 is unnecessary. If an item is found satisfactory and the block is initialed by the inspector, repetition of that information in the inspection narrative is redundant. However, if repairs or replacements were required to make the item satisfactory, then a brief note in the inspection narrative inspection narrative may be appropriate.
- f. Information that will assist subsequent inspectors in the conduct of their inspection should be included in the inspection narrative. For example, identification of which specific components were examined among a random sampling of a large group would aid future inspectors in their selection of which components to examine at their inspection.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**Examples of entries:**

“Visited vessel in company with [owner’s representative] on [Date] at [Place] to conduct drydock examination for credit. This is a standard single-skin tank barge, with 8 integral cargo tanks, a void space in the forward rake, and a box void aft as shown by sketch. There is one cylindrical 7500 gallon diesel fuel tank on deck. The barge is approved for the carriage of Grade B and lower products.”

“Examined all pressure/vacuum valves and flame screens after they were opened for inspection; all were found satisfactory with the exception of those noted on page [blank page number opposite the inspection item].”

“Examination of the vessel’s eight combination fire nozzles revealed they were in good condition and suitable for this type of vessel, which requires only the solid stream nozzle. However, as these nozzles (described on page 9) are not Coast Guard approved, the matter was referred to the OCMI. After I witnessed a test that indicated superior performance of these nozzles compared to the approved straight-bore, the OCMI permitted acceptance under special consideration provisions of 46 CFR 175.25-1.”

“All items listed on pages 4 through 7 were inspected and found satisfactory except as noted.”

“Visited vessel to inspect progress of construction of the hull and internal structural members. All work was proceeding satisfactorily in accordance with approved plans. Several areas in the port fuel tank were marked for pickup welding.”

“Witnessed a satisfactory 4 foot hydro on No. 2 P cargo tank, including examination of hull and deck area in way of tank. A final inspection of the vessel’s entire underwater body was made prior to launching and found satisfactory. Initial drydock examination completed.”

“Initial inspection for certification completed with four (4) outstanding deficiencies noted by attached Vessel/Facility Inspection Requirements, Form CG-835s. Issued temporary Certificate of Inspection this date and recorded information in Bridge Record Card.”

- g. Inspectors must record the following additional items:
- (1) Spaces not entered. The inspector should make an entry in the inspection narrative regarding spaces that were inaccessible during an inspection for certification or annual and periodic inspections.
 - (a) All inspectors should make a pre-inspection check of previous inspection books and/or MISLE data to discover which spaces, if any, have not been entered in the recent history of the vessel.
 - (b) Because of careful recordkeeping, such a review of inspection books and MISLE data should produce an inventory of spaces entered/not entered throughout a vessel’s history. Arrangements should be made to facilitate

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

inspection of those spaces that are due for inspection to ensure the structural integrity of the vessel.

- (2) Extensive repairs/alterations. The inspector should briefly describe any extensive repairs/alterations in the inspection narrative. The inspector may attach a copy of shipyard specifications to the inspection report in lieu of writing a detailed description of the repair or alteration in the inspection narrative (e.g., "Extensive bottom and side shell plating required replacement due to general wastage. See attached specifications.").
- h. Record of inspection page. The inspector must indicate on this page whether or not the vessel is fit for its intended route. The inspector should print his/her name on the record of inspection page and then sign where indicated.
 - (1) If the vessel is not considered fit for service, then the Chief, Inspection Department should be notified as soon as possible.
 - (2) The record of inspection page should also include the name of the vessel representative who accompanied the inspector during the inspection and that individual's contact information.
- i. Record of unsatisfactory conditions or deficiencies identified. The process of recording deficiencies detected during the course of an inspection has always been conducted informally by marine inspectors through personal records, notes, or, in some cases, a formal work list which is provided to the owner's representative. By standardizing this existing process, we can make productive use of this valuable, and previously lost, information.
 - (1) As marine inspection program managers, representatives of the various Headquarters Divisions are often called upon by legislators and others in and out of government to produce records which show the value added by the marine inspection program.
 - (2) It is a mistake to interpret the scarcity of deficiencies noted in MISLE as proof that the Coast Guard does not find anything wrong during vessel inspections. MISLE records only show deficiencies that remain outstanding after the conclusion of an inspection, a number which ideally should be zero. Nonetheless, it is important to document and present a complete picture of the marine inspector's role in detecting vessel safety deficiencies.
 - (3) There are several advantages to increased visibility of the marine inspector's role. This additional information will improve the Coast Guard's ability to measure and monitor areas that are problematic and should become the focus of policy, procedures, or regulation. The Coast Guard will also be able to better

SECTION A: MARINE INSPECTION ADMINISTRATION**CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**

focus training for inspectors on vessels and/or systems with high deficiency rates. Finally, this information will enable us to evaluate the effectiveness of the owners/operators, classification societies, and other flag administrations in carrying out their maritime safety responsibilities.

- (4) In addition to the information the inspection narrative, inspectors must complete a list of deficiencies identified during an inspection. This list must include all deficiencies noted by the inspector, including those corrected on the spot, those corrected prior to completion of the inspection, and those outstanding at the completion of the inspection. If the inspector prefers, they may use the inspection narrative section of the Inspection Book, CG-840 or a local form to list their deficiencies in place of the sample form provided.
- (5) At the conclusion of the inspection, the inspector must ensure that all deficiencies identified during the inspection are entered into MISLE.

D. PERFORMANCE OF AUTOMATED MACHINERY AND EQUIPMENT

See 46 CFR Part 62 for automation regulations. Upon completion of underway tests of initial installations, the inspector must submit a letter reporting the performance of the vessel's automated machinery and equipment to Commandant (CG-CVC) in accordance with COMDTINST 16711.1 (series). See Chapter 6 of this volume and NVICs 1-69, 7-73, and 6-84 for additional information concerning automated main and auxiliary machinery.

E. U.S. PUBLIC HEALTH SERVICE (PHS) INSPECTION RECORDS

The Public Health Service (PHS) promulgates official certificates for sanitary inspections of commercial vessels. These certificates may be retained onboard.

F. LOCALLY MAINTAINED RECORDS

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**1. Measurement of Furnaces, Form CG-836**

When the OCMI deems it necessary, the inspector should complete Form CG-836 after inspecting a firetube boiler. The completed report should be retained in the vessel's file.

2. Renewals of Fusible Plugs

When fusible plugs are renewed at other than the inspection for certification and no marine inspector is in attendance, the vessel's Chief Engineer must submit a written report to the OCMI. The OCMI must ensure that the report is complete and consistent with the information requirements of 46 CFR 2.20-40(c) and 52.01-50(k). These reports should be included in the vessel's inspection records.

G. MARINE INFORMATION FOR SAFETY AND LAW ENFORCEMENT (MISLE)**1. Purpose**

The purpose of MISLE is two-fold: to build safety performance histories of vessels, marine facilities, involved parties, and hazardous cargoes; and to focus and redirect marine safety activities and resources using these histories in analysis of safety degradation patterns and equipment failures.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**H. CERTIFICATE OF INSPECTION (COI), STANDARD MISLE FORM****1. COI Entries—First Page**

Information entered in the MISLE Vessel File Operating Details (VFOD) comprises the majority of page one of a COI. VFOD is where the OCMI specifies manning, route, number of passengers permitted for a vessel, as well as details regarding the carriage of passengers and cargo. The VFOD is divided into three sections used to collect information that will appear on the COI. The first section is used to specify the route of the vessel (using the Route Code), number of passengers permitted, and minimum crew required. For passenger vessels authorized for multiple routes with varying crew and passenger restrictions, the summary section should contain the crew and passenger requirements for the most restrictive of the routes authorized (e.g., if authorized 149 passengers on a “Coastwise” route and 99 passengers on an “Oceans” route, specify the Oceans route requirements). The second section of the VFOD specifies the manning requirements for the vessel. As above, if the vessel is authorized for multiple routes, the manning requirement for the most restrictive route must be entered. The third section of the VFOD is used to specify the details regarding the vessel's route, manning, cargo and passenger carriage, and any other conditions of operation. In this section, the OCMI may specify manning and passenger carriage restrictions for vessels authorized for multiple routes. Consult the applicable MISLE Transaction Guides for specific details concerning other MISLE products to be used for making entries.

2. Amplifying Guidance on Particular Portions of the COI

- a. Passengers – general. It is the OCMI’s responsibility to determine the number of passengers that a vessel can accommodate and can carry with prudence and safety. (As explained in the following paragraphs, this does not apply to ferryboats.)
 - (1) The OCMI should not permit the number of passengers allowed to exceed that allowed by law or regulation. The number allowed should be based on specific criteria including, but not limited to, the vessel's intended operating area, lifesaving equipment carried, stability, deck area and or rail space.
 - (2) Maximum number on ferry vessels. 46 U.S.C. 3501 provides an exception for the number of passengers permitted to be carried on a ferry vessel, as stated on its COI. The maximum number of passengers permitted on a ferry will appear on the COI as "FERRY" when "FERRY" is entered as the Vessel Use Code in the Vessel File Design product (VFDD).

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

NOTE: When stability is a factor in limiting the maximum number of persons that can be carried safely on any ferry vessel, the total number of persons permitted aboard should be stated in the stability letter.

- b. Persons on board other than the minimum operating crew. This policy is intended to give uniform guidance on how the manning data should be entered in MISLE for persons other than the minimum required crew.
- (1) Other required crew. Other required crew consists of maintenance persons the OCMI has required due to special design or operation of a vessel. The number required should be listed with a specific description in the space provided.
 - (2) Other persons in crew. Other persons in crew are licensed and documented crew employed onboard to operate and maintain the vessel in addition to the minimum number of crew set by regulatory requirements. This includes persons in the stewards' department, additional licensed or documented crew which the owner wishes to carry to perform maintenance while underway, and hotel staff.
 - (3) Persons in addition to crew. These are individuals in addition to the crew on an inspected vessel which is not required to be inspected as a passenger vessel. This term includes persons onboard a vessel who are not employed in the business of the vessel. These persons are not required to hold a merchant mariner's certificate. Reference is made to 46 U.S.C. 3304 concerning the number of individuals in addition to the crew permitted on vessels other than passenger carrying vessels.
 - (4) Industrial personnel and scientific personnel. Industrial and scientific personnel are distinct from passengers, other required crew, other persons in crew, and persons in addition to crew. The number of industrial and scientific personnel employed aboard a vessel affects its structural fire protection requirements. For definitions of industrial and scientific personnel, see 46 CFR 90.10-15 and 46 CFR 188.10-71, respectively.
 - (a) If an industrial vessel of 300 GT or more is carrying over 12 industrial personnel, or an oceanographic research vessel is carrying over 16 scientific personnel, the vessels must be inspected for compliance with applicable structural fire protection regulations. The number of authorized industrial and scientific personnel must be identified, and their duties specifically described, on the COI through the MISLE VFOD "free form" blocks.
 - (b) Artificially inflating the other persons in crew and/or persons in addition to crew categories to avoid compliance with structural fire protection regulations or passenger vessel regulations is not permitted.

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- c. Reduced crews. When reduced crews are authorized for less than 24-hour operation, the OCMI must make a COI endorsement under "Route Permitted and Conditions of Operation." Multiple endorsements may be made on a vessel's COI when necessary to address changes in conditions or employment. For additional information, consult the MSM, Volume III, Marine Industry Personnel COMDTINST M16000.8B (series).
- d. Small passenger vessels. See MSM Volume III, Marine Industry Personnel COMDTINST M16000.8B (series) Chapter 19 for detailed guidance on manning.
- e. See MSM Volume II, Materiel Inspection COMDTINST M16000.7 (series), A3.H.3.a below for information regarding allowable reductions in the carriage of child size life preservers when extended size devices are carried onboard.
- f. Automation. When the OCMI has approved a reduced manning level on the basis of an installation of automated control or monitoring systems, the COI must be appropriately endorsed in accordance with 46 CFR 62.50 and MSM Volume III, Marine Industry Personnel, COMDTINST M16000.8B, Chapters 21 and 23.
- g. Route permitted and conditions of operation. This is the narrative portion in which the major route designation is stated, i.e., oceans coastwise; Great Lakes; lakes, bays and sounds; or rivers.
- h. Limitations imposed or extensions granted on routes based on reasons like stability criteria, unique construction, operating areas, or operating characteristics of the vessel should be described by bodies of water, geographic points, distances from shore or geographic points, duration of voyage, daylight operation only, etc. Further conditions of operation, where applicable, would include manning endorsements and any other special endorsements deemed necessary by the OCMI.

NOTE: The route code entered does not map into the narrative portion.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONSi. Barges.

- (1) Financial responsibility. Prior to the Oil Pollution Act of 1990 (OPA 90), the financial responsibility requirements of the Federal Water Pollution Control Act, as amended, provided for a reduction in the liability limits on inland oil barges for the removal of oil discharged into U.S. waters. For this purpose, inland oil barges were defined as non-self-propelled vessels carrying oil in bulk as cargo and certificated to operate only in the inland waters of the United States. OPA 90 removed these limits of liability. Therefore, for financial responsibility/liability purposes, it is not necessary to distinguish between inland oil barges and other oil barges on a COI.

NOTE: This reminder replaces previous text (superseded by OPA 90) regarding reduced financial responsibility for inland oil barges. Routes should continue to be limited for other reasons such as design and class limitations.

- (2) Permissive crewing. Where a vessel owner/operator voluntarily elects to crew a barge not otherwise required to be crewed, the vessel's Route Permitted and Conditions of Operation section of the COI should be endorsed: "The vessel may carry [##] persons as maintenance persons with no duties connected with the navigation of the vessel." On seagoing barges over 100 GT, the endorsement should include the statement: "All maintenance persons must possess a merchant mariners certificate, and a minimum of 75 percent of those persons aboard must be U.S. citizens." This endorsement may be further modified to limit the route on which personnel may be aboard based upon load line, lifesaving equipment, or other relevant factors.
- (3) Watchstanders. It is unnecessary to endorse a watchstander on tank barges, as he/she is to be included in the crew requirements.
- (4) Carriage of vehicles. Endorsements for the carriage of vehicles on tank barges may be stated as "Permitted to carry vehicles - total weight 8,000 kg per unit; axle load 2,500 kg per axle. Vehicles may not be operated."

3. COI Entries - Attachments

Attachments to the COI are issued when there is more information required for a particular vessel than will fit onto the first page. This includes additional endorsements (see MSM Volume II, Materiel Inspection, COMDTINST M16000.7 (series), A.3.H.4 below) and information on vessel particulars such as cargo authority and/or loading restrictions for tank vessels/barges, lifesaving and fire fighting equipment, machinery inspection status, stability letter, and pressure vessels. The following provides information on some

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

of the more frequently used and/or critical detail products. This is by no means an all encompassing list; review the MISLE user guide to ensure that each vessel has all applicable information entered accurately.

a. Lifesaving details.

- (1) The number of persons for which lifesaving equipment is to be provided should normally be the same as the total persons carried; however, for ferry vessels, this figure should be the same as the number of life preservers required. It is only necessary to list the minimum number of items required by regulations; excess equipment does not need to be listed.
- (2) NVIC 14-92 deals with use and carriage of lifejackets (life preservers) with height/weight limits that are lower than the traditional 41 kg (90 lb) for adults. Lifejackets with other, lower height/weight limits marked on them may be used to meet mandatory carriage requirements for persons as the label indicates. Adjustments to carriage requirements for life preservers may be made on the COI according to NVIC 14-92. When lifejackets on board have a lower limit of 1.45 m (57 in) or less, only 5 percent additional child-size devices must be carried on vessels with no limitation on adult or child passengers on its COI. Carriage of a mixture of lifejacket models/styles with lower size limits is not acceptable as the basis for reducing child-size lifejacket carriage requirements.
- (3) Children and COI Endorsements. If no child-size lifejackets are carried on board, the vessel's COI must be endorsed--
 - (a) "For the carriage of ADULTS ONLY"; or
 - (b) "For the carriage of persons taller than XX m or weighing over WW kg. Replacement lifejackets must have an approval for all persons over XX m/WW kg or a smaller lower limit."

NOTE: When the paragraph (b) endorsement is used, the height/weight limits (XXX m/WW kg) are 1.45 m/34kg (57 in/75 lb) for the life preservers listed in enclosure (2) of NVIC 14-92. For life preservers with lower limits below 1.45 m (57 in), the height/weight limits must be taken from their label. A zero ("0") should be entered for the number of child's lifejackets in the Lifesaving Details section of the COI.

- (4) The total number of persons that can be accommodated must be according to the nameplates on the items. The capacity of the rescue boat need not be included. A lifeboat suitable for rescue purposes must be listed as a lifeboat.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- (5) This data should reflect the number of items that are actually carried to meet the minimum total capacity (number of persons) required by regulation. The total capacity of the required items must be listed.

b. Cargo authority.

- (1) Carriage of oil. Each U.S. tankship and integrated tug/tank barge unit of 20,000 or more deadweight tons permitted to carry "oil" (46 U.S.C. 2101(20)) has the cargo authority is listed on its COI to specify the type of cargo it is authorized to carry, the applicable subchapter, and the loading constraints related to structure and stability.
- (a) The proper authorization endorsement is determined from the applicable regulations in 33 CFR Part 157 and 46 CFR 32.53. Cargo grade restrictions are entered under "Highest Grade."
- (b) The value for "Capacity" must be that of all integral cargo tanks, and the "Units" must be in barrels.
- (c) If the vessel carries 46 CFR Subchapter O cargo, then the appropriate CFR Part must be indicated. Data regarding "Loading Constraints" will be provided by Commandant (G-MSC) and is to be entered as appropriate.
- (d) Special cargo restrictions and/or exemptions, such as those found in 46 CFR 36.01-5 and 46 CFR 38.01-5 must be listed by endorsement under "Route Permitted and Conditions of Operation." The following are samples of appropriate wording for "Authorization" entries:
- i. "Crude oil and flammable or combustible liquids."
 - ii. "Products and flammable or combustible liquids other than crude oil."
 - iii. "Products and combustible liquids."
 - iv. "Crude oil, products, and flammable or combustible liquids."
 - v. "Flammable liquids other than oil."
2. MARPOL Annex II/Noxious liquid substances (NLS). See NVIC 03-06 for information on applicable certificates, cargo record books, and endorsement to the Certificate of Inspection.
- (a) "See "Cargo Authority" Located In "Conditions of Carriage."

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- (b) Conditions of Carriage. The following statement should appear at the beginning of the COI "Conditions of Carriage" section: "Per 46 CFR 150.130, the person in charge of the barge (vessel) is responsible for ensuring that the compatibility requirements of 46 CFR 150 are met."
- (c) Once all the tank groups' characteristics and requirements have been verified by an inspector as matching those on a tank vessel's LAC, the following text from the MSC's plan approval letter should be entered in VFCC under another "Cargo Authority" heading: "Only those cargoes named in the vessel's list of authorized cargoes bearing marine safety center approved stamp dated (date) may be carried, and then only in the tanks indicated."
3. Inland tank barges. The following statement should appear at the beginning of the COI of an inland tank barge under "Conditions of Carriage": "Per 46 CFR 150.130, the person in charge of the barge (vessel) is responsible for ensuring that the compatibility requirements of 46 CFR 150 are met. Cargoes must be checked for compatibility using the figures, tables, and appendices of 46 CFR 150 in conjunction with the reactive group numbers from the 'React Grp' column listed above the 'Specific Dangerous (i.e., hazardous) cargo authority' section."
4. Vessels not in compliance with MARPOL Annex II. A self-propelled vessel or oceangoing non-self-propelled vessel, certificated under Subchapter D and which is not in compliance with the MARPOL Annex II regulations, should have a COI endorsement that excludes the carriage of NLS cargoes, e.g., "Vessel may not carry cargoes that are designated as NLS in 46 CFR 30.25, Table 30.25-1, 33 CFR 151.47, and 33 CFR 151.49." The standard cargo authority entered for the COI of these vessels is only by grade(s) of flammable or combustible liquids and does not distinguish NLS cargoes.
- c. **Hull examination and drydock details**. The intent of this guidance is to avoid the forward migration of the hull examination dates from COI to COI. Hull examination dates/intervals should be entered in MISLE serving as an attachment to the COI. The "Next Exam" date entries shall reflect the last day of the month the drydock or ISE is credited (i.e. completed). For example: a 2 year interval salt water environment drydock examination is completed 05May15, the "Next Exam" date shall reflect 31May17. And, in turn, at the next drydock interval, say if the drydock exam was completed 14May 2017 (actual), then in turn, the "Next Exam" would be set to 31May2019. No forward migration of dates. But, when the examination (actual) extends into the following month (i.e. delayed), the "Next Exam" dates shall reflect the last day of the month for the allowable period from the "Last Exam" entry. For example: if the drydock examination is due by 31May15 but the examination is actually conducted (credited) 10Jun15, the

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

“Next Exam” date should reflect same month of when the examination was due. So, the “Next Exam” date shall reflect 31May17 (and not 30Jun17).

- d. **Additional marine inspection details.** Other vessel particulars and systems such as fixed fire fighting systems, steering gear, and machinery can be entered into MISLE by referring to the MISLE user guide.

4. COI Entries - Additional Endorsements

- a. **Military Sealift Command (MSC) vessels.** The following entries should be made for MSC vessels that are certificated:
- (1) For vessel service, enter PUBLIC VESSEL only if the following conditions are met
 - (a) The vessel is Navy owned and operated by a MSC civilian crew; or
 - (b) The vessel is demise chartered by the MSC and is operated by its own civilian crew.
 - (2) Vessels which are time chartered by the MSC, or are either Navy owned or demise chartered and operated by a contract operator are not considered public vessels. The class of vessel is as appropriate.
 - (3) Under "Route Permitted and Conditions of Operation," insert the following endorsement: “Naval vessel, in Service, civilian manned. This vessel has been inspected and certificated in accordance with the standards applicable to military sealift command vessels.”

NOTE: The term "in service" refers to MSC vessels that are manned by civilian crews, as opposed to those manned by naval crews and termed "in commission."

- (4) "Persons in Addition To the Crew" should reflect the number of persons carried onboard a vessel who are connected with the business of the vessel but not classed as crew or passengers. Such persons include military liaison staff on transports or fleet support vessels, technicians and scientists on oceanographic research vessels, military guards on certain cargo vessels, etc. Such personnel should be reflected in the total persons allowed.
- b. **Seasonal restrictions.** COI statements of seasonal restrictions should be as descriptive as possible, specifying details such as limitations on vessel routes and the scope of passenger-carrying authorizations. Seasonal limitations are intended to ensure the overall seaworthiness of the vessel and the safety of the passenger carried under differing operational conditions without completely halting the operation of the vessel during any specific period of time.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- c. Manning requirements for vessels towing inspected passenger barges. These should be indicated on the COI issued to the barge (see the MSM Volume III, Marine Industry Personnel, COMDTINST M16000.8B (series)).
- d. Endorsements for special cargoes. The endorsements required by 46 CFR 36.01-5 and 38.01-5 should be made as indicated.
- e. Endorsements listing cargo names and relief valve calculations. See 46 CFR Part 154.17. Such endorsements should also be made for liquefied gas cargoes regulated solely under 46 CFR Subchapter D.

5. Crew Requirements

- a. Maintenance persons. Maintenance persons may be listed in one of the available slots for required manning. A specific departmental affiliation may be included, e.g., engine maintenance person.
- b. The qualifications of a position, as appropriate, may be further specified under "Route Permitted and Conditions of Operation," e.g., deck maintenance person (any deck rating), engine maintenance person (junior engineer, electrician, deck engine mechanic), or maintenance person (any deck or engine rating). Whenever a maintenance person is listed without departmental affiliation, it is left to the master's discretion to determine where and how to use that person. This action--
 - (1) Allows the master and chief engineer a degree of latitude in determining the ship's internal organization; and
 - (2) Minimizes the possibility of direct Coast Guard involvement in contractual matters of labor management.

NOTE: See MSM Volume III, Marine Industry Personnel, COMDTINST M16000.8B (series), for additional guidance.

- b. Radio officers. When the requirement for a Radio Officer is solely to reinforce the Federal Communications Commission's authority, an asterisk should be entered in the slot for "Radio Officer," with the following endorsement made under "Route Permitted and Conditions of Operation": "If Required By the Federal Communications Commission."
- c. Liquefied gas carriers. The COI for a liquefied gas vessel should clearly state that the cargo officer and cargo systems engineer are non-watchstanders. A notation should be made under "Routes Permitted and Conditions of Operation" specifying that "The chief mate shall be designated the cargo officer and be non-watchstanding" and "The (first or second) assistant engineer shall be

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

designated the cargo systems engineer and be non-watchstanding." The latter designation should be made by the OCMI.

- d. Certificated engineering personnel. These should not be required on the COIs of river and other vessels exempted from this by 46 U.S.C. 8701 and 8702.
 - e. Statement of minimum complement. By law, the COI must state the minimum complement of licensed and certificated personnel necessary for the safe operation of the vessel; this requirement should be strictly followed.
 - f. Radar observer endorsements. These are not necessary, except on certificates for hydrofoils or air cushion vehicles (see MSM Volume III, Marine Industry Personnel, COMDTINST M16000.8B (series)). The regulatory requirements are sufficient without other special notations.
-

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**I. TEMPORARY CERTIFICATE OF INSPECTION, FORM CG-854**

Temporary Certificate of Inspection Form CG-854, authorized by 46 U.S.C. 3309, provides evidence of the satisfactory completion of an inspection for certification. It has all the force and effect of a full term COI and permits operation of a vessel pending receipt of the COI generated by MISLE. This temporary COI is intended for use when the immediate issuance of a full term COI is not possible at the completion of an inspection. When the full term COI can be issued in time to meet the vessel's needs, a temporary COI should not be issued. A temporary COI should never be issued to a vessel that does not qualify for a COI. The vessel's master should be given one copy of the temporary COI while the OCMI retains the original. It is not the Commandant's intention that a COI be withheld pending correction of minor deficiencies after a temporary COI has been issued.

FORM CANCELLATION: Form CG-2801A, List of Merchant Vessels Under Construction or Conversion. Vessel owner/operators are no longer required to submit Form CG-2801A, List of Merchant Vessels Under Construction or Conversion.

The form was used to record Coast Guard inspection resources used for new construction of inspected vessels, uncertificated Military Sealift Command vessels, or vessel conversions. It included information on involvement by the American Bureau of Shipping under the Memorandum of Understanding dated 27 April 1982. This information historically has been used on an infrequent basis by Headquarters personnel; making monthly submissions unnecessary.

Despite its infrequent use, the inspection manhours reported on the subject form are still very important. This information represents a significant expenditure of MI program resources at many ports, particularly for new construction or conversion cases that may last for several months or years. The manhours are eventually used by Headquarters to substantiate both the billet structure in the MI program and future budget requests for resource allocations.

Each OCMI must account for and maintain these MI resource expenditures at the local level. Upon certification, all manhours expended since the initial inspection began, including plan review manhours expended by the unit, must be entered by inspection type into the activity narrative in MISLE.

All of the manhours should not be attributed to "initial certification." If the vessel is not certificated, for whatever reason, the expended manhours must be entered into the MISLE activity before the activity is closed, thereby enabling this information to be retrieved for reporting purposes. The importance of accurate, complete and timely MISLE data entry cannot be overemphasized, even for those cases in which a vessel is

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

not certificated and the MISLE activity is closed.

J. AMENDING THE COI

Amendments to COIs should be made through the MISLE system. In cases where amendments involving last drydock dates or other changes will require a reissuance and reprinting of a vessel's COI, handwritten annual and periodic inspection entries on the COI will be lost when the COI is reissued. To prevent the loss of these entries on a reissued COI, an amendment should be made to the COI in MISLE whenever an annual or periodic inspection is conducted. This will ensure the inspections are recorded when COIs are reissued for any reason.

K. APPLICATION FOR WAIVER AND WAIVER ORDER, FORM CG-2633

This form must be completed and submitted as required by 46 CFR 2.45 and as indicated on the form itself. Copies of waivers issued must be forwarded to Commandant (G-543), as required by the subject matter. When the waiver is referred to the Commandant for action, the OCMI should submit a forwarding letter explaining the circumstances of the case.

L. PERMIT TO PROCEED TO ANOTHER PORT FOR REPAIRS, FORM CG-948

See MSM Volume II, Materiel Inspection, COMDTINST M16000.7 (series), Chapter C4.

M. PERMIT TO CARRY EXCURSION PARTY, FORM CG-949**1. Purpose**

The OCMI should use Permit to Carry Excursion Party, Form CG-949, to allow a vessel to engage in a temporary excursion operation not permitted by its COI. This occurs when a passenger vessel is permitted to carry extra passengers or to operate on an extended route, or when a cargo or miscellaneous vessel is permitted to carry recreation parties on a 1-day basis. The permit should be issued for a limited period of time only, and should be considered a temporary supplement to the COI. The word "temporary" is stressed; an Excursion Permit should not be used as a device to circumvent normal inspection requirements.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**2. Distribution**

The Original copy of Permit to Carry Excursion Party, Form CG-949 should be issued directly to the master, operator, owner, or agent of the vessel; one copy should be electronically scanned and added to “documents” in MISLE. Additional copies may be obtained by the master, operator, owner, or agent of the vessel upon written request to the OCMI.

N. SOLAS CERTIFICATES

1. Passenger Ship Safety Certificate (PSSC), Form CG-968

The number of small passenger vessels certificated with international routes has steadily increased. When certificated for an international route, these vessels require a Passenger Ship Safety Certificate (PSSC) issued in accordance with SOLAS 74/83 in addition to the COI. See MSM Volume II, Materiel Inspection, (COMDTINST M.16000.7 (series), Chapter E2 regarding small passenger vessels subject to SOLAS.

- a. Notification of Approval for SOLAS PSSC, Form CG-969A. Once a vessel desiring an international route has satisfactorily completed the initial inspection for certification, the OCMI should submit SOLAS PSSC, Form CG-969A to Commandant (CG-CVC). This form is normally accompanied by Federal Communications Commission (FCC) Form 806. Except for primary lifesaving equipment, only equipment required by SOLAS should be entered on the form.
- b. SOLAS Exemption Certificate, Form CG-967. Exemptions granted by the OCMI in accordance with Regulations II-1/1(c), II-2/1(e) and III/3(a) of SOLAS 74/83 should be listed on the reverse side of SOLAS PSSC, Form CG-969A. This information should be included at the time of the initial inspection for issuance of a PSSC. The Exemption Certificate is issued in conjunction with the PSSC or a Cargo Ship Safety Equipment Certificate (Form CG-3347).
- c. Issuance of PSSC and Exemption Certificates.
 - (1) Initial issue. Commandant (CG-CVC) issues the initial PSSC and Exemption Certificates based on SOLAS PSSC, Form CG-969A. The originals of the certificates, with copies, are forwarded to the certificating OCMI for distribution. The following statement must be entered on the Exemption Certificate (CG-967).

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

“The below mentioned survey showed that this ship complied with the requirements of the below regulations or equivalent provisions accepted by the Government of the United States of America and substituted, therefore, in accordance with Regulation I/5 and reported in IMO SLS.14/CIRC.87 of 15 November 1989 (copy attached).”

- (a) A copy of IMO SLS.14/CIRC.87 must be attached to the Exemption Certificate. Vessels receiving safety certificates under this arrangement must be issued 1 year COIs to correspond with the PSSC.
 - (b) These vessels must have drydock examinations at least once every 12 months. The authorized international route must be specified on the COI. If applicable, the vessel must have the appropriate Load Line Certificate.
 - (c) Compliance with, or exemption from, SOLAS radiotelegraphy and radiotelephony requirements must be verified by the FCC. Copies of PSSCs issued under this arrangement must be forwarded to Commandant (CG-CVC).
2. Subsequent issue. The OCMI is authorized to reissue subsequent recurring SOLAS PSSCs and Exemption Certificates. If any changes have been made to the exemptions originally granted by the OCMI, they must be submitted to Commandant (CG-CVC) for approval, in which case the certificates will be treated as an initial issue. Copies of reissued certificates should be forwarded to Commandant (CG-CVC).

2. SOLAS Cargo Ship Safety Certificates

- a. Introduction. Cargo vessels and tankships of 500 and more GT that engage in international voyages are subject to SOLAS and are required to have the following SOLAS certificates as applicable:
 - (1) Cargo Ship Safety Construction Certificate, CG-4359 (Rev. 2-80).
 - (2) Supplement to the Cargo Ship Safety Construction Certificate, CG-4359-A (Rev. 2-81).
 - (3) Cargo Ship Safety Equipment Certificate, CG-3347 (Rev. 06-93).
 - (a) Supplement to the Cargo Ship Safety Equipment Certificate, CG-3347A (Rev. 2-81).

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- (b) Attachment to the Cargo Ship Safety Equipment Certificate, CG-3347B (Rev. 06-93).
- b. Cargo Ship Safety Construction Certificate (SAFCON). This certificate may be issued, at the owner's discretion, by either the Coast Guard or the American Bureau of Shipping (ABS) on behalf of the Coast Guard. This certificate should be issued at the completion of a vessel's drydock exam with a period of validity of 5 years from the date of issue. When the ABS issues a SAFCON, ABS should provide the supplement and endorse the certificate as necessary. When the Coast Guard issues a SAFCON, the distribution should be the same as for the vessel's COI.
- c. Cargo Ship Safety Equipment Certificate (SEC). The SEC should be issued by the Coast Guard at the completion of a vessel's inspection for certification. The SEC should expire when the COI expires.
- (1) Except for primary lifesaving equipment, equipment required by SOLAS and actually on board should be noted by numbers of items present on the SEC form; equipment required by SOLAS but not on board should be noted by a zero.
 - (2) SOLAS certificates must not contain asterisks or notes indicating requirements or shortages. The Exemption Certificate noted above is necessary to reflect equipment omissions or authorized shortages.
- d. Attachments. Attachments to the SEC and the SAFCON are forms generated by the International Maritime Organization (IMO) for issuance to cargo ships, including tankships, to indicate the completion of either unscheduled or mandatory annual surveys. Since SOLAS 74 became binding, the IMO has generated two attachments for the SEC and one for the SAFCON.
- (1) An attachment for each certificate was developed for the 1978 SOLAS Protocol. A provision in that Protocol allowed the use of endorsements in lieu of the attachments. The Coast Guard chose to use such endorsements instead of the attachments. For surveys relating to the 1978 SOLAS Protocol, the following endorsement must be typed or stamped on the reverse of a SEC or SAFCON issued by the Coast Guard:

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION**CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**

"In implementation of Regulation 6(B), Chapter I of the Protocol of 1978 Relating to the International Convention for the Safety of Life at Sea, 1974, the Government of the United States of America has instituted mandatory annual surveys."

Mandatory Annual Survey

Place Date

U.S. Coast Guard

NOTE: The SAFCON should have space for three mandatory annual surveys.

- (2) A second attachment to the SEC (noted in N.2.a above) was developed to show compliance with the 1983 SOLAS Amendments. This attachment is issued by the Coast Guard at the same time as the SEC, is considered to be a part of the SEC, and has the same expiration date as the SEC. Paragraph II of the SEC is to be left blank with an asterisk to refer to this attachment.
- e. Supplements. The supplements to the SEC and SAFCON certificates, listed in paragraph N.2.a.(1) and (2) above, are to be issued to tankships of 10,000 or more GT or 20,000 or more DWT, and to those 10 years and more of age. The supplement is considered to be a part of the relevant certificate to which it refers, and their dates of expiration should coincide.

O. CERTIFICATE OF COMPLIANCE (COC), FORM CG-3585

The Certificate of Compliance (COC) shall be used to document foreign vessel examinations of oil tankers, chemical tankers, gas carriers, passenger vessels, mobile offshore drilling units, and floating installations. The COC form includes detailed instructions for Port State Control Officers and marine inspectors based on the type of vessel, the authority used for the exam (port state control or domestic authority), and whether any deficiencies were identified.

P. IMO CERTIFICATES OF FITNESS (COF)

46 CFR Part 153 contains the regulations for the carriage of hazardous liquid cargoes by self-propelled vessels. 46 CFR Part 154 contains the regulations for the carriage of bulk liquefied gases by self-propelled vessels. These regulations implement the IMO Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (BCH)

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

(Resolution MSC.9(53)) and the IMO Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (Resolution A.328(IX)), respectively. Two additional IMO Codes were developed and made mandatory under SOLAS for ships built after 1 July 1986. These are the International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (IBC Code) (Resolution MSC 4(48)) and the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC) (Resolution MSC 5(48)). Each of these codes provides for the issuance of COFs to vessels that comply with the standards of these codes.

1. Considerations for Application

There are some liquefied gas ships that, due to their early date of construction, are not subject to the IMO Gas Code (Resolution A.328(IX)). IMO Resolution A.329(IX), adopted 12 November 1975, provides that gas ships delivered after 31 October 1976, but prior to implementation of the IMO Gas Code, must be reviewed in accordance with the provisions of the code to a reasonable and practical extent. It was recommended that these vessels be issued an IMO Gas Code COF, with endorsements listing the specific provisions of the IMO Gas Code with which they do not comply.

2. Issuance

- a. COF for the Carriage of Liquefied Gases in Bulk, Form CG-5148.
 - (1) Upon request from the master, owner, or agent of a vessel that complies with the IMO Gas Code, the OCMI should issue a COF for a period not to exceed 2 years, dated to expire with the vessel's COI and SOLAS Cargo Ship Safety Equipment Certificate. It should be endorsed to indicate compliance with the International Gas Carrier Code (Resolution MSC 5(48)) if the vessel complies with that Code.
 - (2) For a vessel not subject to the Gas Code, Annex 4A of the certificate should be used to list those areas of the IMO Gas Code with which the vessel does not comply. This should be attached to the COF.
- b. COF for the Carriage of Dangerous Chemicals in Bulk, Form CG-5148A. Upon request from the master, owner, or agent of a tank vessel that complies with the IMO Chemical Code, the OCMI should issue Form CG-5148A. The certificate should be issued for a period of 5 years, dated to expire with the vessel's COI and SOLAS Cargo Ship Safety Equipment Certificate. The COF should be endorsed to indicate compliance with either the BCH or the IBC, whichever applies.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**3. Certificate Entries**

Many of the entries on COF for the Carriage of Liquefied Gases in Bulk, Forms CG-5148 and COF for the Carriage of Dangerous Chemicals in Bulk, CG-5148A require data developed during the technical review process. The MSC will tabulate the data required for the certificate as it is developed and forward it to the cognizant OCMI. This will avoid lengthy file searches when the vessel is ready to be certificated.

4. Copies Required and Distribution

Forms COF for the Carriage of Liquefied Gases in Bulk, CG-5148 and COF for the Carriage of Dangerous Chemicals in Bulk, CG-5148A should be prepared with sufficient copies for the following distribution:

- a. Original: Issued to the master, owner, or agent of the vessel, to be maintained on board the vessel.
- b. Two copies to Commandant (CG-CVC), via District (p).
- c. One copy is the issuing OCMI's file copy.
- d. One copy to the MSC for vessel file.
- e. One copy to the owner or agent of the vessel (if requested).

Q. VESSEL INSPECTION RECORD CARD, FORM CG-2832

In addition to the MISLE data, Vessel Inspection Record Card, Form CG-2832 provides the inspector with ready information as to the inspection status of a specific vessel when it is boarded for various inspections. Recent inspection information from a previous port, which may not yet be entered into MISLE, should be recorded on this form. The use of this form does not diminish the OCMI's discretion regarding types or frequency of inspections. Rather, it is a tool with which the OCMI can better determine the need for further inspections. This form must be carried on ocean and coastwise cargo vessels (including tank vessels) of 500 or more GT, and ocean and coastwise passenger vessels of any gross tonnage (except those inspected under 46 CFR Subchapters T and K). It must be posted in the pilothouse in a suitably installed frame.

1. Entries

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

At the conclusion of each inspection, the inspector should enter the type of inspection conducted, pertinent remarks, drills conducted, port of inspection, his/her signature, and the date on Vessel Inspection Record Card, Form CG-2832. Each inspector who boards a vessel should examine this record to learn what inspections have been conducted, verify the correctness of the inspection status in MISLE, and determine whether any further inspections are necessary. Entries should be made in ink and in accordance with the instructions printed on the form and the policy below.

- a. Initial entries. Upon completion of the inspection for certification, the inspector should fill out Vessel Inspection Record Card, Form CG-2832 and post it in the installed pilothouse frame.
 - (1) When a vessel is permitted to proceed to another port before inspection is completed, the initial inspector should enter "Began" and the type of inspection and date (e.g., "Began COI").
 - (2) When a subsequent inspector has completed the inspection, that inspector should enter on a new line "Completed" and the type of inspection (e.g., "Completed COI"). When another type of inspection, such as a drydock examination or a lifeboat weight test, is performed during the course of the inspection for certification, the inspector should only enter "Annual, Periodic COI".
- b. Subsequent inspections. At the completion of each annual and periodic inspection, the inspector should make an entry on a new line under "Type of Inspection."
 - (1) When two or more distinct inspections are conducted at the same time, all should be entered on the same line, if possible.
 - (2) In the case of continuing inspections involving more than one port, only those parts of the inspections that are completed at the same port should be entered on the same line. Individual visits made during the course of an inspection should not be entered.
- c. Remarks. This section is for information that will aid subsequent inspectors. For example, when conducting inspections incidental to repairs, an inspector should make a brief entry in "Remarks" indicating the nature of the repairs or alterations.
 - (1) If the inspector does not enter all tanks or cargo holds during a COI, he or she should list those tanks or holds that were entered in the "Remarks" section. For drydock examinations, the inspector should indicate which sea valves were opened and inspected.

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

- (2) When a vessel is permitted to sail with outstanding deficiencies after any type of inspection, an entry should be made in the "Remarks" section to inform subsequent inspectors.
- d. Drills. The inspector should check both columns for every entry, even when the type of inspection is defined as including one or both drills. When a fire or boat drill is held independently of another inspection, the inspector should enter "Drills" in the first column and appropriate notations in the other columns.
- e. Port, signature, and date. These should be entered upon completion of the inspection. Only the inspector making the entry should sign the card, even when two or more inspectors participate in the total inspection.
- f. Transferred information. If lifeboat weight tests are not conducted at the time that a new Form CG-2832 is posted, the date of the last weight test and the port where the test was witnessed should be transferred to the new card. Likewise, when remarks on the old card concerning cargo tanks, cargo holds, or sea valves have not changed, the information should be transferred. This information should be the first entry on the new card and should be signed by the inspector.
- g. Additional cards required. To reflect all inspections of the vessel, it may be necessary to keep extra blank Vessel Inspection Record Cards on board the vessel.

2. Disposition of Outdated Cards

After the inspection for certification, the previous Vessel Inspection Record Card(s) may be destroyed or placed in the OCMI's file.

R. MOBILE OFFSHORE DRILLING UNIT (MODU) SAFETY CERTIFICATE, FORM CG-5334

The OCMI issues Mobile Offshore Drilling Unit (MODU) Safety Certificate, Form CG-5334 to Mobile Offshore Drilling Units (MODUs) that comply with the applicable provisions of IMO Resolution A.414 (XI) (the "MODU Code"). The MODU Code was adopted on 15 November 1979, upon request by unit operators. Distribution of Mobile Offshore Drilling Unit (MODU) Safety Certificate, Form CG-5334 should be the same as for a COI.

Except for primary lifesaving equipment, only equipment required by the IMO MODU Code and actually aboard should be entered in paragraph 3 of Mobile Offshore Drilling

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS

Unit (MODU) Safety Certificate, Form CG-5334 (e.g., 2 lifeboats for 80 persons, 4 inflatable life rafts for 80 persons, 84 life jackets, and 8 life buoys). Exemptions granted in accordance with section 1.4 of the MODU Code should be listed in paragraph 4 of the form. If additional space is needed to complete these paragraphs, the reverse of the form may be used.

S. TRACKING ITEMS OF SPECIAL NOTE AND SPECIAL DESIGN FEATURES IN MISLE

One of the primary advantages of MISLE is that it provides the OCMI with the ability to call up a particular vessel, whether U.S. or foreign flag, and obtain a readout of the inspection history of that vessel.

CHAPTER 3: DOCUMENTATION OF VESSEL INSPECTIONS**1. Inspection Notes (General)**

When conditions are discovered during an inspection that should be highlighted for scrutiny at later inspections, the inspector should enter an inspection note in MISLE under the "Notes" tab. The note must be assigned a "Retain Until" date. The note will remain current until this date. After this date passes, the note will remain part of the vessel's MISLE file, but will only be viewable when "view all notes" box is selected in the Notes tab.

2. Inspection Notes (Special Design Features)

Based on the plan review of a vessel, the MSC may advise the OCMI of special design features on a vessel that require entry into MISLE Inspection Note. Conditions of particular note on a vessel must be made a permanent part of the vessel's MISLE inspection at initial or subsequent inspections, as appropriate. Copies of applicable correspondence should be scanned and added to "documents." For vessels that travel to, and are inspected by, different zones, the Inspection Note will alert the OCMI to the particular conditions that must receive specific attention by the inspector at each inspection.

- a. Special design features. Technological advances in the design, construction, and outfitting of vessels frequently outdate specific requirements in existing regulations.
- b. Structural deficiencies. Reviews of Report of Equipment Failure on Inspected Vessel, Form CG-2752, Report of Structural Failure, Collision Damage or Fire Damage to Inspected Vessel, and other casualty studies have revealed that a particular vessel or vessel class may experience initial or recurring structural failures due to either poor design or repair techniques.
 - (1) When such a situation is discovered, Commandant should be notified. See MSM Volume II, Materiel Inspection, COMDTINST M16000.7 (series), Chapter A5 concerning structural failure reports for more information.
 - (2) Such conditions should also become a permanent part of the vessel's inspection record in MISLE.
 - (3) Structural deficiencies that are identified as a class problem by Commandant will be noted by Commandant (CG-CVC) for all vessels in that class.

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS****A. INTRODUCTION**

It is the Commandant's responsibility to determine that vessels subject to inspection meet the requirements of the applicable sections of the Code of Federal Regulations (CFR). The primary means of accomplishing this task, in addition to actual inspection of a vessel by field units, is the review and approval of vessel plans and specifications. The general requirements for plans, drawings, or blueprints are found in 46 CFR 2.90-1. For detailed specifications, see NVIC 8-84.

B. SUBMITTAL PROCEDURES

Plans may be submitted to the Officer in Charge, Marine Inspection (OCMI), the Marine Safety Center (MSC), Commandant (CG-CVC), or to the American Bureau of Shipping (ABS) in accordance with NVIC 3-84 or the Memorandum of Understanding between the Coast Guard and ABS, as discussed in NVIC 10-82, CH-2.

1. Submittal to the OCMI

When the OCMI receives a set of plans, he or she should determine the extent of the new construction or conversion project and decide whether the OCMI or the MSC will review the plans. In many cases, the OCMI may determine that he or she does not have either the personnel or the technical resources to conduct plan review. In such instances, the plans should be examined for the presence of any items that warrant special attention, and then forwarded to the MSC for review. Once the OCMI has reviewed the plans, they should be stamped "Approved," "Disapproved," "Return for Revision," or "Examined." The stamp should include the date and the OCMI's signature. At least one set of the plans should then be returned to the originator with a cover letter that includes any outstanding comments. The OCMI should retain at least one set of the plans on file.

2. Submittal to the MSC

Vessel plans may be submitted directly to the MSC. When this is the case, the MSC normally will not begin plan review until the cognizant OCMI has received an application for Inspection for Certification. Three copies of each plan should be submitted to the MSC for review. Upon completion of plan review, one set of the plans will be returned, with the comment letter, directly to the originator; one set will be retained by the MSC; and a third set will be forwarded to the OCMI with jurisdiction over the vessel. Because of personal knowledge the OCMI may have of the vessel and its intended service or operating area, the OCMI may determine that certain items do not comply with applicable regulations or do not provide the required degree of safety. In these cases, the MSC should be notified promptly of any items that the OCMI considers

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS**

worthy of special consideration or reconsideration. OCMI's should communicate with the MSC or Commandant (CG-CVC), as appropriate, when requests are received for inspection of new construction, major repairs, or conversions for which approved plans and related correspondence are not held.

3. Submittal to ABS

The provisions of NVICs 10-82, Change 2, and 3-84 apply to the submittal of vessel plans to ABS.

C. PLANS AND SPECIFICATION DESIGNATIONS

Whenever plans of inspected vessels are submitted, they must be identified by vessel name and official number whenever known. In the case of a new vessel, designation by shipyard work order number or hull number is sufficient until the vessel name is known; then the vessel's name must be added to the plan. In the conversion of an existing vessel, the new name should be used if it is known, as well as the former name and type designation. Tank vessel plans must be accompanied by information concerning the grades of liquid cargo the vessel will carry and its proposed service. Tank barges shall also be designated as manned or unmanned.

D. SPECIAL SUBMITTAL PROCEDURES**1. Submittal of Electrical Plans**

- a. Submittal to the OCMI. When electrical plans required by 46 CFR 110.25 are submitted to the OCMI, the following plans must be forwarded to the MSC for action:
 - (1) Switchboard wiring diagrams.
 - (2) Switchboard material and nameplate lists.
 - (3) Elementary wiring diagrams of metering and automatic switch gear.
 - (4) Descriptions of operation of propulsion control and bus transfer switch gear.
 - (5) Elementary one-line wiring diagrams of power systems.

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS**

- (6) Electric plant summaries showing connected loads and calculated operating loads for various conditions of operation.
 - (7) Elementary wiring diagrams of steering gear alarm circuits, ventilation shutdown control general alarm systems, and fire protection systems.
 - (8) Elementary wiring diagrams and isometric or deck wiring diagrams of electric watertight door systems and power operated lifeboat winches.
 - (9) Hazardous locations drawings.
- b. Review by either OCMI or MSC. Other plans listed in 46 CFR 110.25 but not listed above may be acted upon directly by the OCMI, or they may be transmitted to the MSC for action.
 - c. Revisions to plans. Subsequent revisions of the plans listed above may be addressed directly by the OCMI, or they may be submitted to the MSC for action. When major changes or revisions are made on these plans, they must be forwarded to the MSC for action.

2. Submittal of Cargo Gear Plans

Plans for cargo gear that have been reviewed and approved by ABS or the International Cargo Gear Bureau, Inc. (ICGB) need not be submitted to the Coast Guard for further review and approval.

3. Submittal of Boiler Plans

Boilers must be designed in accordance with 46 CFR Parts 52 or 53. These parts adopt Section I and Section IV of the American Society of Mechanical Engineers (ASME) Code with modifications to account for the marine environment. It is imperative that the additional requirements in 46 CFR Parts 52 or 53 are identified and met in the design stage to avoid possible rejection of the boiler during installation. For boilers constructed in accordance with 46 CFR Part 52, plans and calculations must be certified by a Registered Professional Engineer (RPE) licensed by one of the fifty states of the United States, the District of Columbia, or U.S. Territories. The RPE's license must be current at the time he or she certifies any plans or calculations. The RPE's certification must appear on each design drawing and on the front page of the design calculations. In addition, the professional engineer should provide a signed statement that the boiler meets the applicable Coast Guard design requirements. The plans must be submitted as early as possible to the MSC for review prior to installation of the boilers. The plans will be reviewed only to the extent necessary to establish that the correct procedures for design

Section A: Marine Inspection Administration

CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS

certification are being followed. Submission of plans and calculations is not required for boilers constructed in accordance with 46 CFR Part 53. Boilers which are automatically controlled must have their control plans approved (see 46 CFR Part 63).

4. Submittal of Pressure Vessel Plans

- a. Requirements. Plans and calculations for Class I-L and II-L pressure vessels and for those pressure vessels that contain hazardous materials must be submitted to the MSC for approval.
 - (1) For other pressure vessels, see 46 CFR 54.01-5 and 54.01-15 for the applicable regulations.
 - (2) Plans required to be available to the inspector under 46 CFR 54-01-5(e) need only be requested for pressure vessels of unusual design, service or pressure.
- b. Certification by a RPE. A RPE may certify a sepia or original drawing if they include the date of certification. Blueprints made from a certified sepia or original drawing are acceptable provided the copy of the RPE's certification is legible. Some RPEs certify a plan by stamping it; others by signing and dating a plan and then embossing the signature with a raised seal. If the document is certified with a raised seal on the original plan (sepia, etc.), then the information contained thereon must be reproducible on all copies.
- c. Method of certifying plans. All plans must be certified by RPE as compliant with Section VIII, Division 1 of the ASME Code, as modified by 46 CFR Part 54.
 - (1) There are no requirements as to the specific wording that the RPE must use for this certification.
 - (2) The certification may appear on the original plan, from which copies may be made, or the RPE may individually sign and certify each copy of the plan.
 - (3) Certification may appear on each page of the calculations, or there may be one certification for the entire set of calculations.
 - (4) The method of certification should be to the satisfaction of the OCMI, but it is recommended that a consistent method is used that either provides for the notation of each plan or the creation of a cover letter with a certification statement. Such a cover letter must include a list of all applicable plans by number, title, and revision or alteration.
- d. Alterations. Alterations and revisions to plans must be dated. Revisions made to a plan after it is certified by a RPE but before the pressure vessel is installed must

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS**

be checked and certified again by the RPE as being in compliance with the Code and 46 CFR Part 54. Alterations or repairs to pressure vessels that have been put into service need not be certified by a RPE, but must be approved and inspected by the cognizant OCMI.

5. Submittal of structural fire protection plans for certain small passenger vessels

Structural fire protection plans for new construction small passenger vessels that will either carry more than 150 passengers or which have overnight accommodations for more than 49 passengers must be submitted to the MSC for action.

- a. Plans returned for revision. In cases when the MSC finds major or numerous minor structural fire protection deficiencies, the MSC will return the plans to the owner or designer for revision. Appeals or questions concerning the extent of required design changes should be directed to the MSC. The MSC should consult with the OCMI when resolving appeals or considering requests for equivalency.
- b. Plans approved, with comments. When a plan includes numerous minor deficiencies or areas that are unclear to the plan reviewer, but that can be resolved more readily by the OCMI, the plans are marked "Approved with Comments" and forwarded to the cognizant OCMI.
 - (1) At this point, the MSC has completed action on the plan and the responsibility for assuring compliance and resolving comments shifts to the OCMI. The OCMI then has the discretion to either require compliance with the MSC's comments or to accept alternate arrangements that satisfy the intent of the regulations.
 - (2) Questions of compliance with comments forwarded with an approved plan and appeals of inspection issues should be addressed to the OCMI.
- c. Resolving outstanding deficiencies. The status of all structural fire protection plan submissions should be verified by the responsible inspector during the final inspection for certification.
 - (1) If any plans remain that are still marked "Return for Revision," it is incumbent upon the OCMI and the MSC to work together closely to determine the status of any outstanding deficiency, and the necessary corrective action to be taken.
 - (2) Serious deficiencies should result in either a delay in certification until the plans are revised and approved and the deficiency corrected, or the issuance of a Vessel/Facility Inspection Requirements, Form CG-835, to complete the plan

Section A: Marine Inspection Administration

CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS

review process and make any necessary modifications within a specified period of time. Restrictions on the number of passengers authorized may also be appropriate.

6. Submittal of Plans for SOLAS Foreign Passenger Vessels

- a. Vessels over 100 GT. Plan review is considered a matter of routine for foreign flag vessels over 100 GT with berth or stateroom accommodations for at least 50 passengers. 46 U.S.C. 3505 prevents a foreign vessel from departing a U.S. port with passengers embarked if the Secretary determines that the vessel is not in compliance with SOLAS.
 - (1) NVIC 1-85 addresses the procedures for plan submittal for verification of a vessel's compliance with the applicable fire safety standards. This plan review, although not required by law or regulation, is essential to the timely conduct of the initial Control verification Examination (CVE). If the owner/operator/builder fails to take advantage of this opportunity, it is likely that a full and thorough inspection will not be possible without significant delay.
 - (2) When an OCMI has advance knowledge of an initial U.S. voyage of a vessel in this category, he/she should make known to the appropriate vessel representatives the importance of plan submission.
- b. Lead time. Plans should be submitted to the MSC at least 45 days prior to the vessel's arrival at its first U.S. port of call. Earlier submission is encouraged, but plans should not be submitted more than 90 days prior to the vessel's arrival at its first U.S. port of call.
- c. Verification. The goal of MSC's plan review is to verify compliance with the applicable standards and to facilitate the initial CVE, not to bestow approval. Plans submitted to the MSC should indicate Flag Administration approval. Upon completion of both fire safety and stability plan review, the MSC will forward the review results and the plans to the OCMI. The submitter will be informed of the results, particularly if the MSC notes deficiencies or requires more information.
- d. Conceptual review. If, in the design stage or early in the construction stage, an owner or builder wants to discuss design to ensure acceptance, the OCMI should direct them to CG-CVC for conceptual review. When vessels have employed novel design features based on interpretation of SOLAS, even timely plan review under NVIC 1-85 may not ensure the vessel will be acceptable for U.S. operations. The OCMI should encourage these vessel owners or builders to be in

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS**

contact with Commandant (CG-CVC) early in the design or construction phases, unless deemed clearly unnecessary.

E. SEQUENCE OF PLAN SUBMITTALS

1. General Requirements

For the proper evaluation of vessel construction plans, it is essential that the following basic plans for all vessels, except those inspected under 46 CFR Subchapter T, are forwarded prior to submittal of the other plans listed in 46 CFR.

- a. Specifications (hull, machinery, and electrical).
 - b. General arrangement.
 - c. Midship section
 - d. Lines.
 - e. Curves of form.
 - f. Calculation of intact stability.
 - g. Capacity.
 - h. One-line wiring diagram of the electrical system.
-

2. Passenger Vessels

In the case of passenger vessels inspected under 46 CFR Subchapter H, the following additional plans must also be submitted:

- a. Floodable length curves.
 - b. Calculations of stability in intact and final flooding conditions.
 - c. Fire control plan.
-

F. PLANS FOR IDENTICAL TANK BARGES

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS**

A new barge is sometimes identical in structure and piping to that of a previously approved barge. To avoid duplication and unnecessary submittal of plans for construction of such a barge, the following procedures should be followed:

1. Proposed Barges

For proposed barges that are going to be identical to previously-approved barges, only general design, hull structure, electrical, and piping plans must be submitted to the MSC for approval.

NOTE: A barge that is based on an already-approved barge must be built in the same yard as the original barge.

2. Extensions of Approvals

When a barge is identical in construction to a previously-approved barge, it is unnecessary to submit new plans.

The cognizant OCMI can give the new barge an extension of the existing barge's approval by letter. The MSC should be informed of the new barge's hull and contract numbers so that its records can be kept current.

3. Non-structural Details

The construction details of any barge that do not involve the vessel structure, such as connections or deck fittings, can be approved by the OCMI in lieu of the MSC.

4. Alterations

When previously-approved construction is changed by a significant alteration, the plans discussed in Subpart F.1 of this chapter must be resubmitted to the MSC for consideration.

The OCMI will determine the significance of the alteration on the merits of the particular case.

G. APPROVAL PROCEDURES

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS**

The information provided below is in addition to the requirements for these plans contained in the applicable subchapters of 46 CFR and sections of 33 CFR. These standards are suitable for typical vessels. The same degree of safety that these standards establish for typical vessels must be maintained in plans for a vessel of unusual form, arrangement, or construction.

1. Passenger Vessel Plans

- a. General standards. The ABS Rules for Building and Classing Steel Vessels will generally be accepted as a standard for the review of structural plans for the construction, alteration, or repair of typical passenger vessels.
 - b. Uses of insulation and covering materials. Approved structural insulation, bulkhead panels, and deck coverings may be used to achieve various structural fire protection classifications for steel bulkheads and decks required by 46 CFR 72.05.
 - (1) The Coast Guard published NVIC 9-97, a "Guide to Structural Fire Protection Aboard Merchant Vessels" to provide information for shipbuilders and others concerned. The sketches accompanying this NVIC show the types, thicknesses, and relative positions of materials necessary to meet Class A-60, A-30, or A-15 requirements. The NVIC does not include Class A-0 construction because no insulation is required on structural steel bulkheads or decks to meet Class A-0 requirements.
 - (2) Since it is impossible to anticipate all combinations of materials that a vessel might use, approval will be given to arrangements differing from these sketches if the alternative arrangements provide equivalent integrity and heat transmission properties.
 - (3) For lists of approved insulation, bulkhead panels, and incombustible materials, see the Equipment Lists, Commandant Instruction (COMDTINST M16714.3, previously CG-190). Current changes are published in the *Federal Register* and the *Federal Register* reprint.
-

2. Cargo and Misc. Vessel Plans

The ABS Rules for Building and Classing Steel Vessels or Rules for Building and Classing Steel Vessels under 61 Meters (200 Feet) in Length will generally be accepted as a standard for the review of structural plans for the construction, alteration, or repair of cargo and miscellaneous vessels.

Section A: Marine Inspection Administration**CHAPTER 4: APPROVAL OF PLANS AND SPECIFICATIONS****3. MODUs**

The ABS Rules for Building and Classing MODUs and Det Norske Veritas Rules for Classification of Mobile Offshore Units will generally be accepted as standards for the review of structural plans for the construction, alteration, or repair of MODUs.

4. Tank Vessel Plans

- a. Plan approval. The ABS Rules for Building and Classing Steel Vessels will generally be accepted as a standard for the review of structural plans for the construction, alteration, or repair of tank ships. The ABS Rules for Building and Classing Steel Vessels for Service on Rivers and Intracoastal Waterways and the Rules for Building and Classing Steel Barges for Offshore Service are accepted as standards for the determination of scantlings for tank barges.
- b. Construction details affecting cleaning/gas-freeing of cargo tanks. One must take particular care to avoid any arrangement of the structural members that would prevent effective cleaning or gas-freeing of a liquid cargo tank. A plan should show that there are adequate provisions for drainage in all longitudinal and transverse members within a tank. Any arrangement of longitudinals, stiffeners, skeys, bilge keels, fenders, or other members that results in the creation of a possible gas pocket, either in the cargo tanks or in areas contiguous to these tanks, should generally not be approved.

5. Plans for Scuppers, Sanitary Discharges, Tank Overflows, Overboard Discharges, Etc.

Various NVICs include explanatory discussions and sketches of installations that will be approved. Proposed methods other than those specifically illustrated in these NVICs may be approved if they meet the applicable requirements of 46 CFR 56.50-95.

SECTION A: MARINE INSPECTION ADMINISTRATION**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****A. INTRODUCTION**

The inspection of a vessel during construction or conversion is normally considered an initial inspection. The scope of such inspections and the standards for construction of vessels and equipment are covered in the applicable regulations. See MSM Volume II, Material Inspection, COMDTINST 16000.7A (series), Chapter A4 concerning approval of plans and specifications, and MSM Volume II, Material Inspection, COMDTINST 16000.7A (series), Chapter B1 concerning inspection of vessels for certification.

Inspections must be conducted during construction and upon completion of the work, as necessary, to determine that the vessel may be safely operated in the service in which it is employed. Reports or inspections by the Officer in Charge, Marine Inspection (OCMI) are not required for minor repairs by replacements with spare parts. However, when repairs are accomplished in a foreign port or under emergency conditions at sea, they must be reported to the OCMI at the first port where the vessel calls after such repairs are made. The OCMI must determine, based on the report they receive, if it is necessary for a marine inspector to attend the vessel and if the repair should be considered temporary or permanent. Whenever feasible, extensive examinations or tests (such as for boilers) may be delayed until the next periodic inspection. Final acceptance of repairs must not be made until the OCMI finds all aspects of the repair satisfactory.

B. REFERENCES**1. Regulations**

Requirements for notifying the Coast Guard of repairs or alterations affecting the safety of a vessel or its machinery, or movement of a vessel to another port for repairs, are contained in 46 CFR 2.01-15. The following regulations also require that the OCMI be notified of repairs or alterations affecting the safety of the vessel and mandate, if the vessel is subject to inspection, that inspections be held:

SECTION A: MARINE INSPECTION ADMINISTRATION

Oceanographic Research Vessels	46 CFR 189.45-1

2. American Bureau of Shipping (ABS) Publications

The American Bureau of Shipping (ABS) has produced numerous publications that contain requirements and instructions for the production of sound, effective hull welds. Rules for Building and Classing Steel Vessels and Rules for Building and Classing Steel Barges for Offshore Service are examples of these publications, which are generally accepted by the Coast Guard as standards. See MSM Volume II, Material Inspection, COMDTINST 16000.7A (series), Chapter A2 for a list of ABS publications.

3. American Society of Mechanical Engineers (ASME) Code

46 CFR 57.02-1 states that the Coast Guard has adopted Section IX, "Welding and Brazing Qualifications," of the ASME Code, with certain limitations and modifications. Section IX, as modified by 46 CFR Part 57, is used as a standard for judging the quality of piping and machinery welds.

4. Navigation and Vessel Inspection Circular (NVIC) 7-68

Inspection personnel must become thoroughly familiar with the contents of NVIC 7-68, "Notes on Inspection and Repair of Steel Hulls." This NVIC provides guidance on the inspection and repair of steel-hulled vessels for certification. For more details, see MSM Volume II, Material Inspection, COMDTINST 16000.7A (series), Chapter B1.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****C. CONSTRUCTION OF VESSELS**

1. General Standards

Vessels to which the inspection statutes and regulations apply must be constructed in accordance with approved plans, specifications, and applicable regulations.

2. Bulkheads and Decks

NVIC 9-97, "Guide to Structural Fire Protection Aboard Merchant Vessels," contains information concerning approved insulation, bulkhead panels, and deck coverings used on most vessels. Cargo or miscellaneous vessels of 4,000 and more GT, built prior to 1 January 1962, may continue to use plywood for nonstructural interior bulkheads in their superstructures, providing that they meet the requirements of 46 CFR 92.05 and 92.07-90. The Coast Guard realizes that there are other materials that minimize fire hazards as required by 46 CFR 92.05 and 92.07; the use of such materials is recommended. Plywood is prohibited for nonstructural interior bulkheads in the superstructures of passenger and tank vessels, and all cargo and miscellaneous vessels of 4,000 and more GT contracted for on or after 1 January 1962.

3. Living Spaces Aboard Tank Vessels

- a. General requirements. The requirements governing construction of the accommodation spaces (staterooms, hospital spaces, passageways) and public spaces, such as messrooms and recreation rooms, on tank vessels are prescribed in 46 CFR Subchapter D.
 - (1) "Fire-resistive material" must be used in the construction and insulation of crew accommodation spaces on tank vessels. The term "fire-resistive material" means noncombustible material approved under 46 CFR 164.009 and listed as "noncombustible materials" in Equipment Lists, Commandant Instruction (COMDTINST) M16714.3.
 - (2) All construction materials, including panels, insulation and any associated support materials, used within living spaces must be approved noncombustible materials.
- b. The only combustible construction materials permitted within living spaces are decorative veneers and trim on the panels of staterooms and public spaces. No combustible materials are permitted in the passageways or in hidden spaces.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

There are also restrictions on the types of furniture or furnishings authorized on board tank vessels.

4. Lap-Welded Joints In Tank Barges

- a. Some shipyards make tank barges with lap-welded strakes, since lap-welded construction can be cheaper and easier than butt-welded construction. (Small shipyards usually use lap-welded construction.) Some lapped joints may be practically unavoidable in any vessel construction; for example, tank barges usually have lapped joints at the turn of the bilge and at the deck edge. Neither the Coast Guard nor ABS has published rules specifically limiting or prohibiting the use of lap-welded joints. However, their use has the following disadvantages:
 - (1) A lapped joint has a void that can form a gas pocket if the fillet weld on the inside is not tight. Several such gas pockets could make the gas-freeing of a cargo tank difficult. In addition, these voids could provide a route for leakage of gas or liquid cargo from one tank to another.
 - (2) There is no way to test the tightness of the inside fillet weld, since the usual methods of testing a tank will indicate leaks only if the inside and outside welds of a lapped joint are not tight.
 - (3) Lapped joints usually experience an increased rate of corrosion.
 - (4) A tank with lapped joints is more difficult to clean than a smooth tank with butt-welded joints.
 - b. Conditions of acceptance. Lap-welded joints may be accepted in way of cargo tanks on tank barges if--
 - (1) Welded stopwaters are provided in each lapped seam in way of oiltight bulkheads;
 - (2) The overlap of the plates complies with ABS rules, which specify that "Lapped joints are generally to have overlap of not less width than twice the thinner plate thickness plus one inch." The size of the overlap should not be excessive, to avoid the creation of large void spaces; and
 - (3) The joints are continuously welded on both sides.
 - c. The use of lap-welded seams in tank barges should be discouraged, but not prohibited unless the inspector finds a failure to meet these requirements.
-

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****5. Single-Dogged Hatches and Scuttles**

Hatches on inspected vessels are generally subject to the approval of the OCMI, according to their suitability for the intended locations on board and their use. There is no provision for type approval and they are not normally seen in detail on plans submitted for the OCMI's approval.

6. Fiberglass Gratings

- a. General. Fiberglass gratings are not specifically addressed in the individual vessel regulations. However, fiberglass is combustible; therefore, its use must be limited based on the general requirements to reduce hazards from fire.
 - (1) Basically, fire-retardant fiberglass may be used anywhere except in accommodation areas, and in any other area where its failure could hinder escape or access by firefighters.
 - (2) Although all fiberglass must be fire-retardant, there are no Coast Guard approvals for fire-retardant fiberglass gratings or cable trays. However, the OCMI may authorize its use in particular installations, considering its fire retardance and the criteria in subparagraph C.6.c of this chapter, below. The manufacturer should provide the Coast Guard inspector with appropriate test data; a report showing a flame spread rating less than 25 according to the American Society for Testing Materials (ASTM) Standard E-84 would constitute appropriate evidence. Fiberglass cable trays may be used in exterior locations and in machinery spaces, provided that they are not installed in concealed spaces.
- b. Restrictions on use. Fiberglass gratings must not be used--
 - (1) Within the accommodation area;
 - (2) In areas where their failure could hinder escape or firefighter access. Vessels fitted with deck foam firefighting systems must have steel or equivalent access to the foam monitors (e.g., deck grating to foam monitors must be steel or equivalent); or

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (3) For cargo tank hatch covers on all foreign tank ships while trading in U.S. waters. Those vessels found not to be in compliance with this policy should be issued a deficiency notice to correct the situation within a reasonably brief time period.
- c. Authorized uses. Since the approval of fiberglass cable trays and gratings is so dependent on the specific location and application, it is not possible for the Commandant to grant general approvals. In the past, however, the use of fiberglass gratings aboard inspected vessels has been authorized in the following areas:
- (1) Sea chest screenings.
 - (2) Small sundeck awnings and supports.
 - (3) Lifeboat bilge flooring.
 - (4) Electrical control flooring.
 - (5) Pipe guards on deck, in cargo holds, and in engine rooms.
 - (6) Fore and aft main deck catwalks.
 - (7) Main deck crossover catwalks.
 - (8) Removable guards over hawseholes, anchor hawsepipes, and scuppers.
 - (9) Personnel barriers, such as protection for electrical panels.
 - (10) Ladders, platforms, and catwalks located within double bottoms, bilges, peak tanks, fuel tanks, liquid bulk cargo tanks, and other spaces not normally entered when underway.
 - (11) Ship staging and work platforms (Occupational Safety and Health Administration (OSHA) requirements may also apply).
 - (12) Platforms and ladders located on radar, radio, or other electrical apparatus masts.
 - (13) Platforms or walkways on kingposts.
 - (14) Overlay on existing weather decks to provide slip-resistant, self-draining walking surfaces.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (15) Overlay on steel decking around electrical equipment to provide for insulation and safety of personnel.
 - (16) Elevated flooring in boatswain's lockers.
-

7. Hull Welding Standards for Aluminum Small Passenger Vessels (T-Boats)

46 CFR 177.300 incorporates, by reference, various non-Coast Guard standards with which a builder must comply to satisfactorily meet minimum structural design requirements. These are broad requirements which are not otherwise defined, particularly with respect to construction details such as welding.

Inspections of aluminum T-boats built in the late 1980's and early 1990's revealed that such T-boats' shell plate fit-up and edge preparation was often such that a proper root gap was not achieved. Because of this, a full penetration weld could not be made consistently in the construction of the vessels.

Essentially, the shell plate was square-buttet together and ground by hand to produce a rough bevel. This procedure effectively left a shoulder in the joint which was not assimilated during the welding process. Further, there was no attempt made to back gouge the weld from the opposite side to remove the discontinuity. Because of this, a lack of fusion remained when a cap pass was applied to the back side, clearly apparent when the weld is x-rayed.

This type of shell welding process is not acceptable for any type of inspected vessel where the long term effects of fatigue could adversely affect the strength of these connections. This could result in failure while in service and/or be less resistant to impact from mechanical damage.

OCMIs must ensure that the joint design and welding of butt joints strictly adheres to the provisions in the ABS Rules for Building and Classing Aluminum Vessels (1975), Chapter 30, Section 30.7, or to the provisions of Lloyd's Rules and Regulations for Classification of Yachts and Small Craft, Part 2, Chapter 3, dependent on the standard used to meet the structural design requirement.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****D. VESSEL REPAIRS, ALTERATIONS, AND "HOT WORK"**

The issue of avoiding casualties on all vessels under repair is extremely complicated, due to the possible presence of explosive gases and sources of ignition created by the use of flame or spark producing tools. No repairs; alterations; or other such operations involving riveting, welding, burning, or like fire-producing actions may be made until the requirements of 46 CFR 35.01-1 have been met. These regulations set forth the provisions under which a certified marine chemist will make a decision as to whether the work can be accomplished safely (see Part I of this Chapter). A tank vessel may have only hot work performed in or on the boundaries of a tank previously containing flammable liquids after the tank has been cleaned and gas-freed by conventional methods, and when the surrounding tanks have been cleaned and gas-freed or inerted with carbon dioxide or water. 33 CFR 126.15(c) applies to vessels conducting hot work while moored at designated waterfront facilities.

E. INSPECTION AND REPAIR OF TANK BARGES**1. Introduction**

Tank barges employed primarily in river or inland service are generally towed alongside or pushed ahead, as opposed to being towed astern. Barges in these services are subjected to rigors of locking and fleeting operations that seagoing barges or self-propelled vessels do not normally experience. Some distinct structural problems have evolved as a result of this.

2. Hull Damage Considerations

- a. Introduction. While the following guidance was conceived generally to address the problems occurring on vessels in river service, the benefits of preventing pollution incidents through its application may be more universally useful. Therefore, this guidance is applicable to all tank barges with areas of the cargo envelope (excluding the deck) that are not protected by a double hull.
- b. Causes. Normal river and inland operations result in frequent structural deformations of a barge's hull. The rubbing of barges against one another and against lock walls causes the hull plating in some areas of the vessel to wear thin (side plating against framing members, barge corners, ends, and knuckles), while the majority of plating remains in good condition. Such wearing diminishes the plate thickness in these areas and causes plate deformation at the edges of the internals. Continued deformation and metal working results in many weakened

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

areas that are extremely prone to crack initiation and growth. Such degradation of strength in the cargo envelope (the hull) makes river and inland barges particularly prone to pollution incidents resulting from the minor damage of routine operations or low-energy collisions.

3. Inspection Standards

The extent of inspection and the types of repairs necessary to ensure that a tank barge can operate safely will depend upon the barge's age, route, and other considerations.

It is not justifiable to impose less stringent inspection or repair conditions upon tank barges that operate along routes with minimal exposure to severe weather or sea conditions if the less-stringent standards could increase the likelihood of a pollution incident.

The provisions of NVIC 7-68 must always be applied to all tank barges.

The following additional notes apply to the inspection of single-hulled tank barges:

- a. Deficiencies. The possibility of a pollution incident arising from a deficiency must be considered when determining whether a deficiency compromises a vessel's suitability for its intended service. A vessel whose condition is considered likely to cause a pollution incident is not suitable for carriage of oil in bulk.
- b. General evaluation of hull plating. Tank barges are subject to the general causes of deterioration noted in NVIC 7-68. However, because of the frequent rigors of locking and fleeting operations, particular attention must be given to end and sideshell plating that must withstand continuous wear.
 - (1) The greatest loss in plate thickness can be expected where such plating is stiffened by internal structural supports or bulkheads. Often, plating between structural supports will show little loss in plate thickness, while plating supported by internals will be extremely thin.
 - (2) The acceptable degree of hull plating deterioration has traditionally been evaluated by considering the effect of the reduced plate thickness on total hull strength. For specific limits for deterioration of various areas of the vessel, see NVIC 7-68. Localized wastage in excess of these limits has generally been accepted, provided that adjacent material retains adequate strength and the localized deterioration does not result in a radical change in cross-section or a general weakening that could act as a notch.
- c. Evaluating excessive deterioration. A further consideration must be whether reduced thickness of the local area would allow penetration of the product

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

envelope from low-energy impacts or abrasion encountered during fleeting or locking operations. The general guide of 25-percent deterioration indicated in NVIC 7-68 applies here. However, there are instances where renewal of hull plate should be required even though deterioration/wastage may be less than 25 percent. An example is heavily or deeply pitted plating areas on vessels which were constructed with less than 3/8" original hull plating. In this case, 25-percent deterioration would mean plating of less than 1/4" as the only barrier between cargo and water. When plating becomes this thin, an evaluation must be made in each case to determine the strength of the hull and its ability to withstand the rigors of routine, unrestricted operations.

4. Repair Standards

- a. General concerns. The need for renewal of plating is generally evaluated by considering its overall condition.
 - (1) In the case of tank barges that must withstand frequent fleeting and locking operations, the hull plating is the only barrier between cargo and water. For these barges, the condition of the plate in the way of internal structural supports should be the determining factor. This is the case even when the plating between internals shows negligible wastage.
 - (2) NVIC 7-68 provides guidance on gauging for evaluation of plate condition and cautions against gauging without sufficient cause. This does not preclude gauging during an inspection to adequately assess the condition of hull plating in the way of internal structural supports. The repeated rubbing of tank barges against lock walls and other barges can leave little evidence of loss of plate thickness in way of internals, and gauging may be necessary to reveal the true condition of such plating.
- b. Plate cracking. The rigors of unrestricted river operations generate problems other than thinning of plating. The repeated working of shell plating against lock walls and other barges causes crack initiation and growth in many areas. Frequent handling of tank barges by towboats results in areas that are repeatedly set in by low-energy impacts, resulting in the formation of cracks in plating. Generally, the presence of more than two repaired cracks in one local area should be cause for special attention, as the formation of a subsequent crack in such areas is likely.
- c. Repairs of cracked plating. To avoid pollution incidents, cracked plating should be repaired through plate renewal or an insert.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (1) The repair procedures outlined in NVIC 7-68 should be followed when cracks are repaired through welding. Proper edge preparation and full penetration welds are very important.
 - (2) When repairs involve the renewal of less than a full plate, an insert of less than 18" by 18" normally should not be accepted (see NVIC 7-68). Inspectors must ensure that the edges of the insert lie in line with existing welds or that the corners of the insert have the proper radius.
- d. Use of rub bars and doublers. As discussed in NVIC 7-68, doubler plates are unacceptable for permanent repairs of tank barge hulls. However, rub pads or rub bar doublers are often installed in areas where excessive wear of the hull plating is detected or anticipated. When such a doubler is to be installed on an existing single-hulled barge, the hull plating to be covered should be carefully examined to ensure that excessive wastage has not already occurred.
- (1) In some cases, older tank barges may have rub pads or rub bars that were installed without adequate evaluation of the hull plating. It may be necessary to remove these to ascertain the suitability of the original hull plating. Where half-round pipe is used as a rub bar, the hull plating beneath is often subject to accelerated corrosion. Gauging from inside the tanks or periodic removal of these bars may be necessary to ensure proper hull plating thickness. Where such rub bars extend across several tanks, the installation of water stops should be considered.
 - (2) Repairs to internals should generally follow the guidance in NVIC 7-68.
- e. Stiffening of internals. On tank barges in river service, the need for repairs to internal structural supports may be questioned because such barges do not normally encounter the stresses of heavy seas and weather conditions and overall hull strength may seem less critical. However, when plating on single-hulled tank barges is not adequately supported, repeated low-energy impacts or excessive stresses from overloading can deform hull plating to the point of failure and result in pollution. Hull plating must always be provided with adequate stiffness to prevent underway panting, and must be able to distribute the force of low-energy impact loading uniformly along the internal structure of the vessel. If the internal structural supports are substantially deformed from original conditions or fail to have the designed amount of contact between support members and hull plating, consideration must be given to requiring renewal.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- f. Restrictions on use of clips. The common practice of welding clips to join distorted members to the hull plating cannot be accepted on single-hulled tank barges for extensive repairs to internals. Isolated use of clips may be acceptable if the internals so repaired continue to provide substantially the designed amount of support to the hull plating.
-

F. STRUCTURAL FAILURES AND CASUALTIES

1. Normal Operating Conditions

It is important to distinguish between structural failures, as defined in the following subparts, and structural damage. Fractures and buckles that result from external forces including collision, allision, grounding, fire, explosion, earthquake, improper cargo handling, or ballasting, (etc) should be reported as marine casualties, not structural failures, if they meet the definitions contained in 46 CFR 4.03. Conversely, fractures or buckles which occur as a result of the natural working of a vessel's hull should not be considered marine casualties.

Because all Class 1 structural failures compromise a vessel's ability to safely operate within its design parameters, they are, by definition, reportable as marine casualties under 46 CFR 4.03. Class 2 and 3 structural failures, as defined, normally fall outside the parameters of the marine casualty definition except in the rare occasion where the cost of a single repair might exceed the monetary value established in 46 CFR 4.03. In any case, the purpose of reporting structural failures is to determine if unwanted trends are developing in particular classes of vessels or vessels which may be operating in a particular environment in order to ensure that appropriate corrective actions are initiated.

2. Classifications and Definitionsa. Definitions.

- (1) Outer shell: The side-shell and bottom plating of a vessel, including the bow and stern rakes of barges.
- (2) Oil-tight envelope: The portion of the outer shell in way of cargo oil tanks and the vessel's bunker/fuel, lube oil, and slop tanks, exclusive of the clean ballast tanks.
- (3) Main strength members: Structural members which provide primary longitudinal strength to the hull and transverse structural members which

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

directly contribute to support longitudinal strength members. Such members include the strength deck plating; side and bottom plating; tank top plating; the center vertical keel; underdeck, side and bottom longitudinal stiffeners; internal longitudinal bulkheads and stiffeners; deep web frames and girders; transverse bulkheads and girders, and associated bracketing connecting the aforementioned longitudinal and transverse structural members.

- (4) **Buckle:** Any deformation in the outer shell and/or strength deck plating and the adjacent internal main strength members to the extent that structural strength has been lost.
 - (5) **Action:** The extent of response an operator must take, with concurrence by the OCMI, for a particular structural failure.
- b. **Class 1 structural failure:**
- (1) A Class 1 structure failure is, during normal operating conditions, either--
 - (a) A visible, through thickness fracture of any length in the oil-tight envelope of the outer shell where threat of pollution is a factor, or;
 - (b) A fracture or buckle which has weakened a main strength member to the extent that it compromises the vessel's ability to operate safely within its design parameters.
 - (2) In the case of a Class 1 structure failure, the operator must initiate immediate corrective action with approval of the cognizant OCMI. Temporary repairs may be permitted to allow the vessel to safely transit to a repair facility.
- c. **Class 2 structural failure:**
- (1) A Class 2 structure failure is a fracture or buckle within a main strength member which does not compromise the safety of the vessel to operate within its design parameters and does not create a threat of pollution either by location or containment.
 - (2) In the case of a Class 2 structure failure, the vessel operator and OCMI must evaluate and agree upon the necessary corrective action(s). Temporary repairs may be authorized until the next scheduled repair period.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**d. Class 3 structural failure:

- (1) A Class 3 structural failure is any fracture or buckle which does not otherwise meet the definition of a Class 1 or 2 structural failure or a fracture which might normally be considered a Class 2 but is determined not to be detrimental to the strength or serviceability of the effected main hull structural member.
- (2) Class 3 structural failures do not require corrective action or OCMI notification. Class 3 structural failures must be noted for the record, monitored by the operator if deemed desirable, and addressed at the next regularly scheduled repair period.

3. Notification of Class 1 Structural Failures on U.S. Flag Vessels

The following actions must be taken when a Class 1 structural failure occurs on any U.S. documented, non-recreational vessel.

Under no circumstance will a vessel be allowed to operate under the terms and conditions of its Certificate of Inspection until permanent repairs are completed and approved by the OCMI.

Temporary repairs with additional imposed conditions of operations may be authorized by the OCMI to permit the vessel to proceed to a discharge port and/or repair facility.

- a. Operator's responsibility. When a Class 1 structural failure is discovered, the vessel operator must immediately report it to the cognizant OCMI of the zone where detected.
 - (1) The operator must complete and submit Coast Guard Form, Report of Marine Accident, Injury or Death, CG-2692 in accordance with 46 CFR 4.05-10. Class 1 structural failure must always be reported on the Report of Marine Accident, Injury or Death, CG-2692 regardless of when or where the structural failure is found.
 - (2) The operator must also submit details of the temporary and/or permanent repair procedures to the OCMI and the ABS (or appropriate class society). The repair plan must include a past history of any similar failure, the results of any past analysis related to that type of failure, and the results of past repair actions. Operators of vessels with either Coast Guard Critical Areas Inspection Plans (CAIPS) or ABS Enhanced Survey Programs are advised that submittal of these documents for OCMI review would satisfy this requirement.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (3) If the operator has no history to provide, then a failure analysis is required. The original must be sent to the OCMI with a copy to Commandant (CG-CVC).
 - (4) Design induced failures on vessels that have had plan approval by the Marine Safety Center (MSC) must be reported to the MSC.
- b. OCMI responsibility. The OCMI must advise Commandant (CG-CVC), in conjunction with district (p), immediately after receiving notice of a Class-1 structural failure by the most expeditious means possible. Commandant (CG-CVC) will advise Commandant (CG-5P-TI) of the event.
- (1) After regular working hours and on weekends, notification should be made through the National Command Center. If cognizant Commandant (CG-CVC) personnel are unavailable, notification should be made to a Commandant (CG-5P-TI) Traveling Inspector. The OCMI must evaluate the operator's repair proposal.
 - (2) OCMI's are strongly urged to contact Commandant (CG-5P-TI) for consultation regarding acceptable repair procedures. Commandant (CG-5P-TI) files contain significant information on previously approved repairs which would be beneficial to ensuring consistency across Marine Inspection zones.

4. Tank Vessel Restrictions

Operational restrictions may be placed upon tankships pending completion of permanent repairs to their oil-tight envelopes. Such restrictions may include prohibition of carrying cargo in the affected tank(s) in order to allow a vessel to remain in service while in that condition. The vessel operator must submit calculations to the OCMI which demonstrate that the other intact tanks can be loaded without placing additional stress on the hull structure and that the vessel can safely operate with the affected tank either ballasted or empty.

5. Vessels with Recurring Structural Failures

A vessel which suffers repeated Class 1 structural failures or a continuous high number of Class 2 structural failures will be placed in a "Special Attention Vessels" category. Vessels not otherwise enrolled in the CAIP program outlined in NVIC 15-91, Change 1 and A5.J of this volume may be required to do so. If the condition of the vessel's hull structure does not significantly improve, additional operating restrictions regarding route and service may be imposed. In severe cases, the vessel's Certificate of Inspection (COI) may be revoked and the vessel removed from service. Commandant (CG-CVC) maintains

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

a list of these vessels and they will be regularly attended by a Traveling Inspector. All structural repairs for these vessels must be approved by Commandant (CG-CVC).

6. Vessels Enrolled in the Alternative Compliance Program (ACP)

As of February 1995, a pilot program was established to delegate the ABS authority to perform surveys of U.S. flag vessels on behalf of the Coast Guard, pursuant to issuance of a COI. Guidance for this program is contained in NVIC 2-95, Change 2. Unless otherwise provided for in part J of this chapter with respect to the CAIP Program, approval of Class 1 structural repairs lies solely with the ABS unless it is determined through oversight monitoring procedures that the repairs are inadequate. Participation of a vessel in the Alternative Compliance Program (ACP) does not relieve an operator of the responsibility of reporting a Class I structural failure to the cognizant OCMI.

7. Documentation of Class 1 Structural Failures

It is rare for two or more types of Class I structural failures to occur during the same event or examination interval. Should this happen, each type must be reported on a separate Report of Marine Accident, Injury or Death, CG-2692. If multiple failures of the same type occur, they may be reported on a single Report of Marine Accident, Injury or Death, CG-2692. At a minimum, the following information should be provided with the Report of Marine Accident, Injury or Death, CG-2692 for each Class I structural failure:

- a. A one or two sentence description on the Report of Marine Accident, Injury or Death, CG-2692 noting the location and size of the fracture, affected structural components, how the failure was found and method of repair. It is acceptable to attached a shipyard repair specification or class surveyor's report if they contain this type of information.
- b. Photos and/or sketches of the structural failure with identifying marks noting the strake; plate number; frame number; side or bottom longitudinal number; location, i.e., port, starboard or centerline; ship's name and any other useful reference points. Photographs should clearly indicate the originating point of the fracture if it can be visually determined.
- c. A description of the structural detail if it is determined that it caused or contributed to the cause of the failure. This should include a description of any similar detail failures which previously occurred in that vessel or sister vessels.
- d. Identification of the vessel's trade and principal operating route; time and weather conditions when the failure occurred; and the stability condition of the vessel,

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

including hull stresses, if available. When the specific time of the failure is not known, a general statement about weather conditions and stability patterns is sufficient.

- e. Steel samples must be obtained for analysis and/or nondestructive testing for Class 1 structural failures (not previously analyzed) if the cause of the failure is not due to some obvious or known discontinuity. The vessel operator must arrange for the failure analysis if it will assist in determining the cause of the failure. A copy of the report must be provided to the cognizant OCMI investigating the failure.
- f. When accurate information is not available, then the best available data must be reported. This should include information regarding the date when the failure was found, approximate time/date when the failure may have occurred, possible contributing environmental conditions, stability condition of the vessel and any other possibly pertinent information. All such information should be noted as approximate.

8. Notification of Class 1 Structural Failures on Foreign Flag Vessels

In addition to the procedures outlined in Paragraph E.3.a, the following items must be adhered to when a Class 1 structural failure occurs to a foreign vessel operating in U.S. waters:

- a. The vessel operator or authorized agent must provide a repair proposal to the vessel's flag administration or Recognized Organization (RO) representative and the cognizant OCMI. Repairs are not authorized until approved by the flag Administration or RO.
 - b. If the class society authorizes temporary repairs, the OCMI will notify the vessel's master and agent that the vessel will not be allowed to return to a U.S. port until permanent repairs are accomplished and approved by the vessel's flag administration or RO and all outstanding conditions related to the incident are resolved.
 - c. Under port state control authority, the OCMI may reject flag administration or RO approval of either permanent or temporary repairs if it is determined that they will not restore the vessel to a condition to allow it to operate within its design parameters.
-

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****9. Notification of Class 2 and Class 3 Structural Failures**

Class 2 and Class 3 structural failures as defined in Subparagraph E.2.c of this Chapter do not meet the definition of a marine casualty in 46 CFR 4.03. Therefore, neither failure is required to be reported on Report of Marine Accident, Injury or Death, CG-2692. However, when Class 2 and Class 3 structural failures are detected, the following actions will be taken.

- a. Class 2 structural failures. Class 2 structural failures have the potential to become serious through fracture propagation, particularly in a longitudinal strength member that has failed in tension.
 - (1) Refer to NVIC 15-91, Change 1, which contains important information regarding critical crack length and brittle failure.
 - (2) When a Class 2 failure is found, it must be reported to the cognizant OCMI even if not found during a scheduled Coast Guard examination.
 - (3) The operator must submit a repair proposal containing either a temporary or permanent repair. Based on the information presented in the proposal, the OCMI may allow a temporary repair or require immediate permanent repair. In no case will a temporary repair proposal be accepted during a hull examination for credit unless it involves the necessity of the vessel proceeding to another port for permanent repair.
- b. Class 3 structural failures. Class 3 failures are not required to be reported to the OCMI if they are found at times other than a credit hull exam. The operator must address all Class 3 failures at each credit hull examination. Based on location, size and type of structural member involved, the OCMI may elect to defer repairs and permit the failure to be monitored at some mutually agreeable interval with the operator, particularly if the repair will set up a hard spot or stress riser making the detail more susceptible to failure.

10. Documentation of Class 2 and 3 Structural Failures

Operators of all vessels which have either a CAIP manual and/or an ABS Enhanced Survey record must enter the types and dispositions of the failures as appropriate and in accordance with the guidelines of part J of this chapter or the ABS Rules pertaining to enhanced surveys. Vessels not required to maintain these records should have such failures recorded in MISLE. The entry should be detailed to sufficiently describe the number and types of failures and where the hard copy of the repair approval is located.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

OCMIs are encouraged to contact the Traveling Inspectors regarding repair of Class 2 failures as a means to help ensure consistency throughout marine inspection zones.

11. Relationship Between the OCMI and Class Societies Regarding Repair Approval

Historically, many OCMIs required operators to submit and obtain approved repair plans from the cognizant class society prior to presenting it to the OCMI. While this works successfully in most cases, there have been occasions when OCMIs have had concerns about items they felt were inadequately addressed in the class society approval. Typically, the OCMI waits to review proposed repairs until the cognizant class society has approved the repairs. In order to help ensure a harmonious regulatory position, all OCMIs should review any repair proposal concurrently with their local class society counterparts. This partnership facilitates the repair approval process by forging a unified regulatory review that assures that the acceptance by one party will not be disputed by the other, resulting in untimely delays.

12. Forwarding of Class I Structural Failure Reports

Upon completion of the investigation of a Class 1 structural failure, the OCMI must forward the Report of Marine Accident, Injury or Death, CG-2692 and all supporting attachments to Commandant (CG-INV) for inclusion into the casualty database via the district (p) office.

G. REPORTS OF EQUIPMENT FAILURE ONBOARD INSPECTED VESSELS

Whenever approved systems, items of approved equipment (systems or items approved under an approval number), or non-approved systems fail and a dangerous condition results, Report of Equipment Failure on Inspected Vessel, CG-2752A, must be submitted. This report is only to indicate failures, not to report replacements due to normal wear or deterioration. All steering gear failures must be reported in as much detail as possible.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****H. NFPA CERTIFIED MARINE CHEMISTS****1. Requirements for Inspections Prior to Hot Work**

The following regulations require an inspection to be made before alterations, repairs, or operations involving hot work are undertaken within cargo tanks used to carry flammable and combustible liquids or chemicals in bulk or on their boundaries, fuel tanks and their boundaries, piping, and equipment connected to cargo or fuel tanks:

TYPE	CFR CITATION
Tank Vessels	46 CFR 35.01
Passenger Vessels	46 CFR 71.60
Cargo and Miscellaneous Vessels	46 CFR 91.50
Public Nautical School Ships	46 CFR 167.30
Oceanographic Research Vessels	46 CFR 189.50
Mobile Offshore Drilling Units (MODUs)	46 CFR 109.573

2. Requirement for a Marine Chemist

In the United States or its territories and possessions, inspections preceding hot work must be made by a marine chemist certified by the National Fire Protection Association (NFPA). For a list of certified chemists, see the annual NFPA Marine Chemists Directory.

When no marine chemist is reasonably available, the regulations provide for the OCMI to select and authorize another person to perform the required inspections (see Subpart I.7 of this Chapter). When the vessel is not in the United States and no marine chemist or other person authorized by the OCMI is reasonably available, the regulations require the inspection to be made by the senior vessel officer present and properly noted in the vessel's logbook.

NOTE: It is unsafe to conduct an Internal Structural Examination (ISE) while a vessel is loading/discharging, even when the space is certified by a Marine Chemist. Due to the potential for changing conditions which would create a hazardous environment, the ISE must not be performed under these conditions.

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****3. Functions of the Marine Chemist**

The Marine Chemist will--

- a. Conduct a physical inspection and test the condition of tanks and spaces;
- b. Determine what previous cargoes were carried;
- c. Check calibration of instruments before and after each day's use; and
- d. Test spaces for oxygen (19.5 percent minimum), combustible gases (must be below 10 percent Lower Explosive Limit (LEL)), and toxic substances (minimum by Threshold Limit Values (TLVs)). TLVs are published in the latest edition of the booklet, "Threshold Limit Values for Chemical Substances and Physical Agents in the Workroom Environment." This is published by the American Conference of Governmental Industrial Hygienists.

NOTE: For additional information concerning toxic vapor hazards in confined spaces, see MSM Volume I, Administration and Management, COMDTINST M16000.6 (series), Chapter 10.

4. Marine Chemist Certification

The marine chemist must complete and sign a marine chemist certificate indicating the compartment is "safe for workers" and "safe for hot work" before hot work begins.

A signature of receipt is required from the owner, employer, or shipyard representative responsible for posting the certificate and maintaining the conditions it requires.

The certificate also states conditions under which the marine chemist should be consulted or recalled.

Unsigned marine chemist certificates are invalid. The marine chemist notes the results of his or her inspection on the certificate, as well as any conditions that must be maintained by the competent person, including--

- a. Frequency and types of additional tests;
- b. Further inspections;
- c. Qualifications, and;

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- d. Other pertinent instructions.
-

5. Standards for Marine Chemist Activities

The publication "Control of Gas Hazards on Vessels," NFPA 306 (latest edition), is the guide for the inspections required and certificates issued before alterations, repairs, or operations as described above are performed. Inspection personnel should become familiar with the provisions of NFPA 306 and the procedures that the marine chemist must follow to issue a marine chemist certificate, as well as additional requirements for bulk chemical cargo tanks and Flammable Cryogenic Liquid (FCL) carriers.

6. Competent Person

- a. Introduction. OCMIs should become familiar with the OSHA requirements in 29 CFR 1915.12 concerning flammable and oxygen-deficient atmospheres and tests conducted by competent persons. This designation is a creation of the OSHA regulations (29 CFR 1915), by which certain functions related to ship repair, shipbuilding, and shipbreaking are performed. A competent person is generally defined in the OSHA regulations as a person capable of recognizing and evaluating employee exposure to hazardous substances and other unsafe conditions. The competent person is also capable of specifying necessary protection and precautions to be taken to ensure the safety of employees required by the particular regulation to which the condition applies.
- b. Functions. The competent person is responsible to his or her employer. One or more such persons are required to be designated by employers when working conditions in a shipyard involve flammable atmospheres. If a certified NFPA marine chemist performs the duties of the competent person in addition to the duties of the marine chemist, that fact must be recorded. The competent person's duties generally involve--
- (1) Determining oxygen content in tanks or spaces prior to workers' entry;
 - (2) Determining concentrations of flammable vapors or gases in cargo tanks and other spaces having contained flammable or combustible liquids or gases prior to entry by workers;
 - (3) Maintaining safe conditions relating to cleaning and cold work in tanks and spaces having contained combustible or flammable liquids or gases;

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (4) Determining concentrations of flammable vapors or gases in areas not requiring a marine chemist certificate prior to hot work;
- (5) Maintaining, receipting for, and posting marine chemist certificates and appropriate warning signs;
- (6) Maintaining and testing conditions in tanks and spaces after certification is issued by a marine chemist; and
- (7) Maintaining a log of inspections, tests, operations performed, and any instructions from the marine chemist.

NOTE: Qualifications for a competent person include knowledge and application of protective equipment and devices to minimize hazards from coatings and residues, fire watches, fire extinguishers, charged hoses, fresh air breathing apparatus, air purifying respirators, etc.

NOTE: In spaces where toxic atmospheres or residues may be present, only a marine chemist, industrial hygienist, or other person similarly qualified to recognize and test for toxic substances must be authorized to conduct the required pre-entry tests and inspections.

- c. Interaction with the marine chemist. The competent person accompanies the marine chemist through the vessel while the latter conducts the tests and inspections necessary to certify tanks as safe. The competent person normally conducts a tour of all operations at least once every 24 hours and usually more often, depending on the type of work in progress. The marine chemist is not required to conduct follow-up inspections and tests unless recalled or unless conditions affecting issuance of certificates change (e.g., opening additional tanks, transferring oil, changes in atmospheric conditions of tanks).
- d. Interaction with the Coast Guard. In summary, the competent person is charged with carrying out the responsibilities of the employer in meeting the provisions of the marine chemist certificate and additional requirements of the OSHA regulations. The OCMI's role in this process should be--
 - (1) Awareness of the OSHA and Coast Guard regulations relating to shipyard operations;
 - (2) Awareness of the employer's responsibility to follow OSHA and Coast Guard requirements;

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (3) Identification of those instances when existing regulatory requirements are not being followed, either by the competent person or the marine chemist;
 - (4) Reporting violations of regulations and unsafe practices to OSHA Regional Directors (concerning competent persons) or to Commandant (MSC) (concerning marine chemists); and
 - (5) Dialogue with local marine chemists, OSHA officials, and shipyard employers to gain more insight into how competent persons and marine chemists operate, and to resolve problems of mutual concern.
-

7. Substitutes for Marine Chemists

- a. **Introduction.** Under the regulations, the OCMI may be called upon to authorize another person to perform required inspections when it is claimed that the services of marine chemists are not reasonably available. The OCMI should consider each case on its own merits, considering the usual availability of marine chemists within reasonable distances, the impact on the vessel of delays in securing marine chemists, the nature of the cargo that the vessel previously carried, etc.
 - b. **Restrictions.** If it is necessary to authorize another person to perform a marine chemist's functions, the OCMI should give the greatest consideration to persons with long practical experience in the repair of vessels, rather than those versed in theory alone. An authorized substitute for a marine chemist is limited by the regulations to act only in the case of an individual vessel. Blanket authorizations for a person to act in lieu of a marine chemist are prohibited.
 - c. **Authorization procedures.** Authorization for persons to act in lieu of a marine chemist must be made in writing. The names of persons making such recommendations, the person(s) recommended and their credentials, the name of the vessel being examined, the shipyard or repair point, and the date of recommendation must be indicated. Copies of such authorizations must be kept in a separate file marked "Marine Chemists - Authorized Substitutes For." From time to time, the OCMI may be asked to report on such authorizations to determine which areas require additional marine chemists.
-

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****8. Certification Standards**

The NFPA certifies each person found to be a competent marine chemist to carry out the requirements in NFPA-306. An NFPA-appointed qualification board of five members examines each marine chemist application to determine whether the applicant fulfills all requirements set forth in Appendix A of the current Marine Chemists Directory. Each marine chemist must re-qualify every 5 years by completing additional training and educational requirements to ensure that he or she remains abreast of changing technology. The Coast Guard and OSHA provide nonvoting liaison officers to the qualification board who address their agencies' policies and problem areas. The Coast Guard liaison officer relays comments from field units regarding individual marine chemist performances to the board.

9. Types of Certificates

The NFPA only issues one type of certificate. This unlimited certificate certifies that the holder is competent to discharge all duties of a marine chemist in accordance with NFPA 306, on vessels of all types and sizes except FCL carriers. A special FCL carrier endorsement on the marine chemist certificate (license) is necessary before a marine chemist is authorized to issue marine chemist (gas-free) certificates for such vessels.

I. REPAIRS AND ALTERATIONS TO MARINE ENGINEERING EQUIPMENT

1. Introduction

The requirements in 46 CFR Part 59 apply to the repair of all boilers, appurtenances, and pressure vessels subject to inspection by the Coast Guard.

Repairs, replacements, and alterations must not be made without prior approval by the OCMI except in an emergency. The submittal of plans and specifications for approval may be required as specified in 46 CFR 59.01-5.

2. Tailshaft Repairs

The Coast Guard will accept welded repairs to tailshafts used on ABS-classed vessels when they meet ABS requirements or other authorized classification society for vessels enrolled in ACP. When possible, repairs and tests to such shafts should be witnessed by a Coast Guard inspector. The inspector must verify that the work was performed by a welder qualified or certified by the Coast Guard, the U.S. Navy, or ABS, and that the

SECTION A: MARINE INSPECTION ADMINISTRATION**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

welding repair is satisfactory. The ABS Guide for Repair, Welding, Cladding and Straightening of Tail Shafts details the procedures for repairing cracked steel shafts by welding. This guide also contains the requirements that must be passed prior to qualification to repair cracked or corroded shafting by welding. In the case of unclassified vessels, the inspector should use these recommended procedures as a guide in determining whether a satisfactory repair has been made.

J. CONVERSION OF LANDING SHIPS, TANK (LSTs)

NVIC 7-56, "Manned LST's; structural reinforcement and drydocking hull inspection requirements," contains instructions for the structural reinforcement of landing ships, tank (LSTs) being converted for manned commercial operation in ocean, coastwise, or Great Lakes service, and for the inspection of these vessels after conversion. NVIC 11-63, "LST's as Unmanned Barges; structural reinforcement and drydocking hull inspection requirements," contains the requirements for LSTs converted for use as unmanned barges (See MSM Volume II, Material Inspection, COMDTINST M16000.7A (series), Chapter B5).

K. CRITICAL AREAS INSPECTION PLANS (CAIPS)**1. Use of CAIPs**

NVICs 15-91 and 15-91, Change 1 established guidance concerning the implementation and use of Critical Area Inspection Plans (CAIPs). CAIPs may be applied to any vessel or class of vessel based on evidence of repetitive and significant structural failures. The purpose of the CAIP is to identify, track, and document the history of a vessel's structure, including the means and methods employed to mitigate structural failures through modification of substandard design and construction details. The CAIP should be a living document. As a vessel ages, it is reasonable to expect that new and/or more frequent failures of the hull girder will occur due to fatigue caused by a variety of factors. These could include repetitive cyclical loading in a seaway, stresses imposed by environmental factors, operational conditions such as route, speed and cargo operations and type of service. In this manner, causes of structural failures are addressed and permanently corrected. This eliminates the potential for performing in effect a temporary repair of a fracture or defective which immediately addresses the symptom, but does not hold up in service.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS****2. Use of CAIPs by Inspectors**

Periodic updating of the CAIP ensures that the latest and best information about the hull structure is available to inspectors attending the vessel. All inspectors assigned to hull examinations of CAIP vessels must review the CAIP manual prior to commencing the inspection. This is particularly important for new inspectors with limited hull/structural experience, as the information directs attention to areas highly susceptible for failure, provides detailed information on previously approved repair procedures which aid in evaluating a current repair proposal, and ensures a consistent regulatory approach. Inspectors are cautioned that, although the CAIP is an excellent road map for detecting fractures, the remainder of the vessel must be carefully examined as unexpected fractures, potentially indicative of new trends, could have occurred since the last examination interval.

3. Establishing CAIP Requirements

As outlined in NVIC 15-91, the following implementation procedures apply:

- a. Commandant (CG-CVC) is the implementing authority for CAIPs on vessels operating in multiple OCMI zones. This is based on review of Class 1 structural failure casualty data, MISLE sorts on Class 2 structural failure entries and Traveling Inspectors' reports.
 - b. The cognizant OCMI is authorized to establish CAIPs for vessels that operate solely within that OCMI's zone. The OCMI must notify the district and Commandant (CG-CVC) of the CAIP initiation.
 - c. G-MOC maintains a list of all vessels required to have CAIPS. This will be available in an MSIS VFSC product. As of June 1996, all tankers engaged in the Trans Alaskan Pipeline Service (TAPS) trade, including all vessels engaged in the export of oil from Valdez, Alaska to a foreign destination, are required to maintain CAIPS.
-

4. Operator Responsibilities

When a vessel or class of vessels is designated by Commandant (CG-CVC) for the CAIP Program, the vessel operators must do the following:

- a. Develop a CAIP in accordance with the performance elements of Enclosure (2) to NVIC 15-91. Format of the CAIP is left to the operator's discretion as long as all of the performance criteria is included in the document.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- b. Submit the CAIP to the vessel's classification society for review and approval.
 - c. Upon classification-society approval, forward a copy of the approval letter to Commandant (CG-CVC). Submittal of the CAIP itself is not required.
-

5. CAIP Surveys

All CAIP surveys are the responsibility of the vessel operator. Coast Guard inspectors are not required to be present during the surveys but OCMI's are strongly urged to assign inspectors because of the tremendous training opportunities afforded by these inspections. Vessel operators often employ highly experienced structural experts to examine and evaluate the vessel's internal structure. These individuals are generally also responsible for drafting repair proposals. Inexperienced inspectors can gain important experience pertaining to structural assessment through association with steel surveyors. The following guidelines must be followed:

- a. Notice of a CAIP survey should be given to the cognizant OCMI at least 15 days in advance.
- b. If Coast Guard inspectors will attend, the operator should present the extent and schedule of the exam to the cognizant OCMI. OCMI's are encouraged to contact the Traveling Inspectors Commandant (CG-5P-TI) to discuss upcoming surveys. The Traveling Inspectors have extensive records of many past CAIPs that would be helpful to the marine inspector.
- c. The CAIP must be conducted by an individual who is qualified to conduct structural examinations. This individual may be a class surveyor, a surveyor who has been certified by a classification society, or an experienced surveyor who can provide documentation of his/her qualifications to the OCMI. Port engineers and/or ship's officers may be employed if the operator attests in writing to their qualifications. CAIPs conducted by unqualified individuals will not be accepted.
- d. Cleanliness of the internal structure is paramount to the quality of the CAIP survey. Cleanliness is a subjective term. However, as a minimum, critical and active repair areas should be--
 - (1) Sufficiently free of standing water, particularly around bottom shell master erection butts and weld wraps of mushroom or rat-hole cutouts of bottom shell longitudinals;
 - (2) Sufficiently free of sludge and mud;

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- (3) Sufficiently free of wax build up and loose scale, and;
 - (4) Cleaned to prevent soft coatings, if applied, so as to prevent or hinder fracture detection.
 - (5) If the CAIP surveyor has any doubt about the cleanliness of the internal structure, further butterworthing, water-washing, and/or stripping must be conducted.
- e. Surveys may be completed by any of the following methods--
- (1) Rafting;
 - (2) Staging, or;
 - (3) Other techniques that apply latest and best technology, such as high resolution cameras suspended in tanks, which result in satisfactory close-up examination of the vessel structure and are acceptable to the OCMI. Ideally, any of the physical methods employed should permit the surveyor or inspector to be no more than 10 feet from any structural component within the critical area defined by the CAIP.
- f. Upon completion of the CAIP survey, the operator must prepare a survey report for entry into the CAIP manual. One copy must be entered into the manual aboard the vessel and another must be forwarded to the cognizant OCMI for review. The operator must provide an executive summary of the report to G-MOC. This summary should be brief. It must only contain types and numbers of the various classes of structural failures noted and if these failures were in existing or new active repair areas. It is expected that these documents be prepared and forwarded within 60 days of the CAIP survey.

6. OCMI Responsibilities and Guidance

The cognizant OCMI must ensure that the following items are adhered to:

- a. OCMI's must instruct their inspectors to review the CAIP at each drydock exam and inspection for certification to verify that the plan is updated and the required surveys have been performed.
- b. When resources permit, inspectors should participate in CAIP surveys. It can not be stressed enough what an extremely valuable training opportunity a CAIP is to first tour inspectors. Attending inspectors should monitor the survey and assess its overall quality and completeness.

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

- c. When OCMI's are advised of fractures, they must require and monitor repairs as required by Subpart E.2 of this Chapter.
- d. OCMI's should conduct a thorough review of CAIP reports to determine if the periodic information from NVIC 15-91 is provided. The following areas should be of particular interest:
 - (1) Scope of the survey.
 - (2) Qualifications of the surveyor.
 - (3) Fractures reported as required.
 - (4) Repair proposals submitted by the operator are acceptable within the established guidelines. Repair procedures specifically to TAPS tankers can be found in MSM Volume II, Material Inspection, COMDTINST 16000.7A (series), Chapter B4.
- e. CAIP's provide a historical record of the vessel's structural failure and repair history.
 - (1) This history should be employed to evaluate current repair proposals. If certain construction details or prior repairs continue to fail, repairs in kind should not be authorized.
 - (2) OCMI's must notify operators of their responsibility to improve the deficient detail(s) and work in conjunction with the operator and vessel's class society to mitigate reoccurrence. Conversely, OCMI's and attending surveyors should recognize the effectiveness of prior repairs and design modifications and accept current repairs done in accordance with these procedures. This supports consistency across OCMI zones.
- f. When Class 1 fractures occur, OCMI's must require a failure analysis or non-destructive testing of steel samples in accordance with Subparagraph E.7.e of this Chapter. The CAIP process was developed to analyze structural failures and prevent or mitigate their recurrence. Such analysis is vital to this effort.
- g. A history of recurring structural failures combined with an operator's reluctance to develop a permanent solution to their cause is sufficient grounds for the OCMI to recommend to Commandant (CG-CVC), via the cognizant district (p), that a vessel be restricted from a particular trade, or, removed entirely from service. This is a complex process that requires several levels of review. However,

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

**CHAPTER 5: VESSEL CONSTRUCTION, CONVERSIONS,
ALTERATIONS, AND REPAIRS**

nothing is intended to limit the OCMI's authority to remove a vessel's COI if it is determined that the vessel cannot safely operate within its design parameters.

- h. After review of the CAIP survey report, the OCMI must ensure that the proper CAIP survey information is entered into MSIS.
- i. Vessels in the ACP. Several vessels required to maintain CAIPs have been accepted into ACP.
 - (1) These vessels are inspected by the ACP class society on behalf of the Coast Guard and are subject to oversight only.
 - (2) All oceangoing tankships classed by the ABS are required to follow Enhanced Survey guidelines in addition to normal survey requirements. The Enhanced Survey requirements closely parallel CAIP standards and are deemed equivalent as permitted by NVIC 15-91, Change 1, for the normal twice in 5-year drydock interval.
 - (3) The Enhanced Survey guidelines do not specify any annual survey requirements. Thus, strictly adopting the ABS guidelines for Enhanced Survey causes the operator to not comply with the Coast Guard standards if the vessel is subject to an annual CAIP requirement.
 - (4) When overseeing these vessels, the OCMI must determine that the vessel has completed an annual CAIP to NVIC 15-91, or, that the Enhanced Survey guidelines have been formally extended by ABS to the annual interval and that the required surveys have been performed. Failure to conduct either examination within the prescribed interval will cause the vessel to be removed from service until done and possible civil penalty procedures initiated against the operator.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 6: MISCELLANEOUS VESSEL INSPECTION ACTIVITIES**A. INTRODUCTION**

This chapter discusses vessel inspections other than drydocking, annual and periodic inspections that are related to, but do not necessarily occur at the same time as, inspections for certification.

B. PERMISSION TO PROCEED FOR REPAIRS ONLY**1. Authority**

Under 46 U.S.C. 3313, repairs may be deferred (when it can be done safely) until a vessel reaches a port where repairs may more conveniently be done. The regulations applicable to issuance of permits to proceed are:

VESSEL TYPE	CITATION
Procedures Applicable to the Public	46 CFR 2.01-15
Tank Vessels	46 CFR 31.10-35
Passenger Vessels	46 CFR 71.05
Cargo and Miscellaneous Vessels	46 CFR 91.05
Public Nautical School Ships	46 CFR 167.30-5
Small Passenger Vessels	46 CFR 176.202 (Sub T) 46 CFR 115.202 (Sub K)
Oceanographic Research Vessels	46 CFR 189.05

2. Permit to Proceed to Another Port for Repairs, Form CG-948

- a. Upon request of the vessel owner or operator and under certain conditions the Officer in Charge, Marine Inspection (OCMI) may issue a Permit to Proceed to Another Port For Repairs, CG-948, to a vessel.
 - (1) This permit is a substitute for the Certificate of Inspection (COI). The permit must be issued only when the OCMI judges that the vessel may proceed safely.
 - (2) When the a Permit to Proceed to Another Port for Repairs, CG-948, is issued, the OCMI must withdraw the COI and all amendments thereto and forward them to the OCMI of the zone to which the vessel will proceed.
 - (3) A Permit to Proceed to Another Port for Repairs, CG-948, must not be issued to a vessel that is eligible to retain its COI, nor to which an amendment to the COI would suffice.

CHAPTER 6: MISCELLANEOUS VESSEL INSPECTION ACTIVITIES

- b. Restrictions. A Permit to Proceed to Another Port for Repairs, CG-948 allows a vessel to voyage from one port to intermediate ports along a route to its port of destination. However, the vessel may not voyage to several ports and return to the original port or voyage from a port in the continental United States to a port outside the continental United States and then return. If the vessel's COI has expired or is about to expire, the OCMI may issue a Permit to Proceed to the port of final discharge, provided an inspection for certification has been conducted to the point where the OCMI considers it safe for the vessel to proceed and load or discharge cargo. The inspection may be continued at other ports and may be concluded at the port of destination. In such case, appropriate transfer of inspection records among OCMI's will be conducted.
- c. Conditions of operation. Every Permit to Proceed should be worded to expire when the vessel reaches its port of destination. Additional information regarding the purpose for making the voyage, the nature and extent of necessary repairs, special conditions to be observed, modifications in crew or equipment requirements, and whether or not the vessel may carry passengers or cargo, must be set forth clearly on the permit. A Permit to Proceed may be renewed or extended by the OCMI with jurisdiction over the vessel.

3. Pre-Issue Inspection

Issuance of a Permit to Proceed to Another Port for Repairs, CG-948, is contingent upon Coast Guard inspection to determine that the proposed voyage can be conducted safely. The scope and extent of the inspection must vary according to the circumstances, and must be determined ultimately by the OCMI.

4. T-Boats Proceeding for Repairs

When not carrying passengers, vessels inspected under 46 CFR Subchapter T may proceed to another port for repairs without obtaining this form. This is permitted because a small passenger vessel need not operate under the terms of its COI when passengers are not carried.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 6: MISCELLANEOUS VESSEL INSPECTION ACTIVITIES**C. Sanitary Inspections****1. Authority**

The statutory authority for sanitary examinations on vessels is found in 46 U.S.C. 33-08. The regulations establishing requirements for sanitary inspections are:

VESSEL TYPE	CITATION
Tank Vessels	46 CFR 31.10-45 and 35.01-5
Passenger Vessels	46 CFR 71.45
Cargo and Miscellaneous Vessels	46 CFR 91.35
Nautical School Ships	46 CFR 168.15-60
Small Passenger Vessels	46 CFR 176.818 (Sub T) 46 CFR 115.818 (Sub K)
Oceanographic Research Vessels	46 CFR 189.33

2. Inspection Procedures

- a. Scope of inspection. Coast Guard sanitary inspections concern design, construction, and arrangement of tanks, crews' quarters, galleys, and similar spaces.
 - (1) Sanitary inspections begin with plan approval prior to construction, alterations, or conversions.
 - (2) Aspects of sanitary concern include accommodation spaces, ventilation, plumbing, lighting, heating, control and location of overboard discharges, venting of fresh water tanks, installation of hot and cold water in hospital spaces, provisions against fresh water piping running through oil tanks (because of possible contamination), installation of proper drains in waste disposal systems and low points in piping systems, and the installation of insect screens and similar items where required.
- b. Sanitary inspections of crew's accommodations. Accommodations, including washrooms, messrooms, galleys, and storerooms, must be examined for sanitary conditions. The marine inspector must be satisfied that quarters are of the dimensions required, properly ventilated and in a clean and sanitary condition, and equipped with the proper plumbing and mechanical appliances required, and that such appliances are in good working order.
- c. Frequency of inspections. Sanitation on inspected vessels is generally the responsibility of the master and the chief engineer. Coast Guard inspection

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 6: MISCELLANEOUS VESSEL INSPECTION ACTIVITIES

personnel should restrict the number of sanitary inspections to the minimum compatible with statutory and regulatory requirements.

- (1) A sanitary inspection must be held during each inspection for certification, annual inspection, periodic inspection, drydocking, and such other times as provided for by statutes and regulations.
- (2) Sanitary inspections of T-boats must be held as the OCMI deems necessary; normally, they must coincide with COI and annual inspections.
- (3) Inspectors must be alert to unsanitary conditions at all inspections.

3. Unsanitary Conditions

- a. Documentation. If a suspected unsanitary condition is discovered, the inspector should take appropriate action to document the condition. The local Coast Guard unit should request assistance of the Food and Drug Administration (FDA) and/or the Public Health Service (PHS), Centers for Disease Control (CDC). These agencies are able to provide a detailed sanitation analysis, such as detecting the presence of bacteria in food or on food processing equipment. The results of the inspection should include detailed, verified, technical information upon which the Captain of the Port (COTP) can initiate enforcement action. These agencies may be contacted at the following addresses:

U.S. Public Health Service
Office of the Chief
P.O. Box DO, CPS, CDC
1015 North American Way, Rm 107
Miami, Florida 33132-2017

NOTE: The CDC has published an Operations Manual which describes their Vessel Sanitation Program. Coast Guard units may request a copy of the manual by contacting the CDC at the Miami or Atlanta addresses listed above.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION A: MARINE INSPECTION ADMINISTRATION

CHAPTER 6: MISCELLANEOUS VESSEL INSPECTION ACTIVITIES

- b. Enforcement. If the unsatisfactory sanitary condition is of such a nature or magnitude that the district commander or COTP could reasonably determine, based on the detailed results of the inspections conducted by either the FDA or the PHS, that a clear threat to the vessel, crew, passengers or safety exists, enforcement action may be taken under Title 33 CFR 160.111(c). Enforcement action on foreign flag vessels initiated under U.S. law or under the provision of the International Labor Organization Convention Concerning Minimum Standards in Merchant Ships (ILO 147) must be reported in accordance with Enforcement of the ILO 147, COMDTINST M16711.12, (series).
-
-

D. TRAVELING INSPECTION STAFF (CG-5P-TI)

1. Introduction

The traveling inspection staff conducts and monitors various inspections and examinations of vessels of particular interest and provides oversight of field missions with feedback directly to Commandant (CG-5P). The staff also conducts special missions and studies in support of inter-division issues to improve commercial vessel safety and increase awareness of marine safety. The vessels targeted for attention by this staff vary based on the priorities the Director of Prevention Policy (CG-5P). Examples of targeted vessels are U.S. deep draft vessels over 20 years of age, Trans-Alaska Pipeline Service (TAPS) tankers, large passenger vessels (over 100 GT), U.S. vessels of novel build or design, and U.S. vessels undergoing major conversions, modifications, or life extensions and ACP enrolled vessels.

2. Purpose

Traveling Inspectors perform oversight of targeted vessels and conduct special studies to provide sound technical advice and recommendations to Commandant (CG-5P) which help form program direction and measure the effectiveness of existing programs and policies. Unit Commanding Officers may request advice or assistance from this specialized and highly experienced staff on issues of particular concern.

CHAPTER 6: MISCELLANEOUS VESSEL INSPECTION ACTIVITIES**3. Interaction with Field Units**

In most cases, a representative of the cognizant field command should accompany the Traveling Inspector at each vessel inspection. Traveling Inspectors do not issue marine inspection deficiency requirements Vessel/Facility Inspection Requirements, CG-835s; however, they may make recommendations for Vessel/Facility Inspection Requirements, CG-835s to the cognizant OCMI/COTP. Special inspection reports will be submitted by the Traveling Inspector to Commandant (CG-5P). Recommendations that the Traveling Inspector may offer include an action addressee, generally a program manager or Headquarters Division Chief, who will coordinate any necessary district or field unit action. Copies of special inspection reports must be forwarded by the traveling inspection staff to appropriate districts and field units after approval by Commandant (CG-5P).

E. EXEMPTIONS FOR LAID UP, DISMANTLED, OR OUT-OF-COMMISSION VESSELS

Under 46 U.S.C. 3302(e), vessels subject to the vessel inspection laws are exempted from inspection when they are laid up, dismantled, or otherwise out of commission. Under 46 CFR 31.01-1, 70.05-1(a)(2), and 90.05-1(a)(3), tank, passenger, cargo and miscellaneous vessels need not possess a COI when in such condition.

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**A. PHILOSOPHY AND RELATED POLICY**

1. General Philosophy

All personnel involved in commercial vessel safety, whether in the field or at a staff, have the personal responsibility to continue developing and increasing their proficiency and the proficiency of those around them. There is no finite amount of knowledge regarding ships, structures, systems, equipment, navigation and operations. No one person can acquire all the required knowledge. As such, Commercial Vessel Compliance personnel must always strive to improve personal and unit proficiency to apply the best solutions to challenging problems and enhance the safety of an ever-evolving maritime industry.

Feeder Ports are the backbone of training for Commercial Vessel Compliance personnel, producing highly competent marine safety professionals who will train the next generation of marine inspectors and supply the Prevention program with personnel who understand the marine industry that we protect. Specific guidance for Feeder Ports is found in Section C.1.

Non-Feeder Ports must also continue to train and develop their personnel. It is probable that a Journeyman Marine Inspector reporting to a non-feeder port will not always have the correct mix of certifications and will have to be trained for new competencies.

Training programs at both Feeder Ports and Non-Feeder Ports must also consider the training needs of the enlisted workforce, generally known as Vessel Examiners.

Training should be integrated in operations, both through formal unit programs and informally. Opportunities for unique training opportunities (e.g., different vessel types, steam, unique repairs) should be seized and capitalized on. Additionally, working with local industry and manufacturers provide an opportunity to gain a much deeper understanding of systems that we regulate.

Commercial vessel certification is achieved through selected formal training and significant On-the-Job-Training (OJT). Verifying Officers (VO) are integral to the OJT process and are discussed in detail in Section D.4. In addition to VOs, many successful training plans incorporate coaches or mentors to assist new inspectors through their transition to marine inspections and the OJT process.

2. Optimal Marine Inspector

- a. **Background.** It is imperative that all Commercial Vessel Compliance personnel develop suitable proficiency beyond initial competency attainment. The Optimal Marine

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

Inspector definition is an ideal that begins to formulate what is suitable proficiency. The term was used in the 2012 Marine Inspector Strategic Needs Assessment and is integral to the Human Performance Technology cycle.

- b. Definition of Marine Inspector. Marine Safety Manual, Volume I, Administration and Management, COMDINST M16000.6 (series), Chapter 3 defines a Marine Inspector as:

The marine inspector is an officer or civilian assigned to the inspection department of a field unit to perform the field duties of the Commercial Vessel Safety (CVS) Program. The inspector must understand and apply federal statutes and regulations, Coast Guard policy, and accepted industrial standards in the inspection of construction, alterations and repairs, equipment, and operating procedures for various types of vessels. To this end, the inspector shall be thoroughly familiar with applicable references (including this manual), and shall take advantage of available technical training.

- c. Traits of Optimal Marine Inspector. The Optimal Marine Inspector is a confident and competent member of the maritime community who:

- has an in-depth technical knowledge of the maritime transportation system including vessel components, policy and regulations,
- demonstrates thorough understanding and correct application of regulations, policies, and technical information,
- is capable of balanced decisions with consideration of how they affect commerce, public safety and environmental risk,
- is committed to the Coast Guard marine safety mission,
- promotes self and others in continued professional and inspector development, and
- is recognized as a leader in the marine safety community.

- d. Relationship to Vessel Examiners. The traits of the Optimal Marine Inspector were developed as part of a Strategic Needs Assessment focused on Marine Inspectors. Vessel Examiners should also work towards acquiring and displaying these traits within their scope of responsibilities.

3. Related Policy

- a. Marine Safety Manual Volume I. Marine Safety Manual, Volume I, Administration and Management, COMDINST M16000.6 (series), provides policy and guidance on a

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

number of important topics including Marine Safety program philosophy, authorities for Marine Safety activities, Marine Safety organization, personnel management, and occupational health. This chapter is aligned with Marine Safety Manual Volume I and provides specific direction related to Commercial Vessel Compliance Personnel.

- b. Coast Guard Sector Organization Manual. The U.S. Coast Guard Sector Organization Manual, COMDTINST M5401.6 (series), provides general guidance with respect to unit training organization, certification boards, and competency management. This chapter is also aligned with that policy and provides specific direction related to Commercial Vessel Compliance Personnel.
- c. Coast Guard Officer Specialty Management System Manual.
 - (1) The Officer Specialty Management System is outlined in the Coast Guard Officer Specialty Management System Manual, COMDTINST M5300.3 (series). This system is used to quantify demand and measure supply of the officer workforce based on specific specialties and sub-specialties.
 - (2) The OSMS applies to commissioned officers O-1 through O-6, and their corresponding officer positions, both active and reserve. Chief Warrant Officers (CWOs) are managed separately. CWOs who become Lieutenants under the CWO to Lieutenant Program have the opportunity to earn specialties and subspecialties codes.
 - (3) The Officer Ashore Prevention (OAP) specialty designation is used for Prevention Officers. Two sub-specialties apply to officers working in Commercial Vessel Compliance: OAP-11 - Marine Inspection and OAP-16 - Marine Safety Engineering Technical. Each sub-specialty contains certain knowledge, education, training, or competency requirements to earn an Officer Specialty Code.
 - (4) Sub-specialty descriptions and the associated requirements to earn Officer Specialty Codes can be found on the Officer Specialty/Sub-Specialty Requirements (OSR), Form CGHQ-5318. Officers working in Commercial Vessel Compliance should review OAP-11 and OAP-16 to understand the requirements to earn the associated Officer Specialty Codes.
- d. Enlisted Rating Advancement Training System (ERATS).
 - (1) The ERATS establishes training standards for each rating within the Coast Guard, which must be completed to become eligible for advancement in a chosen rating. The system is designed to align rating training with organizational goals, technological change and to leverage the full range of learning resources available to best support workforce performance.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (2) The system is comprised of six major training components: the Rating Performance Qualification Standard (RPQS), Rating Advancement Test (RAT), Enlisted Professional Military Education (EPME), Advancement Qualification Examination (AQE), Core Competency Requirements and participation in the Servicewide Examination.
- (3) Additional information on ERATS can be found on CG Portal.

4. Terms of Reference

The following definitions are provided for convenience, bringing together relevant definitions from a number COMDTINSTs. Any update in a controlling COMDTINST takes precedence over the definition found in this table.

Term	Definition
Attainable Competency	A competency that can be obtained at a specific unit due to the frequency of that particular activity. Attainable competencies are determined by the Marine Safety Mission Performance Support Committee based on input from the Sector Staffing Model or Marine Inspector Training Officer/Training Officer. Attainable competencies are also sustainable.
Competency *	Formerly known as a “qualification”, a competency is a collection of tasks with the associated skills, knowledge, and abilities (e.g., tools, methods, information, doctrine, procedures, materials, etc.) needed to perform the tasks to a predetermined, measurable, performance standard.
Competency Code*	An alphanumeric code, up to eight characters long, that uniquely identifies a competency in Direct Access. This code is established when the competency is created in Direct Access. Users will only see this code when creating ad hoc competency queries.
Certification*	Formerly known as “qualified”, a certification is an endorsement by the Sector Commander or designee, indicating that specified standards of knowledge and performance were met, or they are being maintained for a particular competency. Certification alone does not guarantee assignment to duties since currency requirements or requirements for newly reported personnel must also be met.
Certification Boards*	Certification Boards are used to assess a trainee’s understanding of the duties and potential for performance. “Certification” does not mean that they have attained mastery of craft or proficiency because members are expected to continue to grow well after they first obtain their competency and certification. There are five types of certification boards: Oral Pre-board, Final Assessment, Final Board,

USCG Marine Safety Manual, Vol. II: Materiel Inspection

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

	Currency Board and Revocation Board.
Currency*	Maintenance of proficiency and knowledge associated with a particular certification usually by performing an inspection / examination within a specific timeframe.
Feeder Port	A Feeder Port is a Sector or Marine Safety Unit (MSU) with a diverse workload and sufficient volume to allow for training in at least four of the marine inspection (MI) and port state control (PSC) competencies. Feeder ports provide qualified MIs and PSCOs to fill those positions throughout the Coast Guard. Feeder Ports are designated by Commandant (CG-CVC).
Letter of Certification*	A letter issued to a member who has successfully completed all the training and certification requirements for a particular competency. (Also referred to as a qualification or designation letter).
Newly Reported Personnel*	Newly Reporting Personnel are those members new to a division or unit from either an internal or an external transfer.
Marine Inspector	A marine inspector is an officer or civilian assigned to the inspection division of a field unit to perform the field duties of the Commercial Vessel Safety (CVS) Program. The inspector must understand and apply federal statutes and regulations, Coast Guard policy, and accepted industry standards in the inspection of construction, alterations and repairs, equipment, and operating procedures for various types of vessels. To this end, the inspector shall be thoroughly familiar with applicable references (including this manual), and shall take advantage of available technical training. (Definition from Marine Safety Manual, Volume I, Administration and Management, COMDTINST M16000.6 (series), Chapter 3.)
Marine Inspections Training Officer (MITO)	Exclusive to Feeder Ports, MITOs are designated by the Commanding Officer as being responsible for administering a unit's Inspections Training Program. These positions are filled by highly skilled civilian marine inspectors. (Appendix A of U.S. Coast Guard Sector Organization Manual, COMDTINST M5401.6 (series), has additional information).
On-the-Job Training (OJT)*	OJT is the planned process of developing knowledge and skills at the "point of work performance", which will be conducted in the field, or an office or watchstander setting. OJT emphasizes one-on-one coaching and training by an experienced subject matter expert (SME) or accomplished performer who holds the corresponding competency.
Proficiency*	A measurable, established level of skill or ability required for the competency attached to a specific position. This characteristic is assigned to a competency when it is attached to a position.
Sector	The term "Sector" in this policy includes any command, detachment

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

	or detached duty station that performs commercial vessel compliance activities.
Sustainable Competency	A competency that can be maintained (for currency) at a specific unit due to the frequency of that particular activity. Sustainable competencies are determined by the Marine Safety Mission Performance Support Committee based on input from the Sector Staffing Model or Marine Inspector Training Officer/Training Officer.
Training Officer (TO)	TOs are designated by the Commanding Officer to be responsible for administering a unit's Training Program including, but not limited to inspections. The TO oversees the Sector's Training Board. See Chapter 7 of U.S. Coast Guard Sector Organization Manual, COMDTINST M5401.6 (series).
Training Board*	A Sector or Unit Training Board is required by Chapter 2 of the Performance, Training and Education Manual, COMDTINST M1500.10 (series), and is discussed further in Chapter 6 of the Sector Organizational Manual.
Training Manager*	A person designated by the MITO/TO to assist a command staff element or department in executing Sector Competency Management policy.
Verifying Officer (VO)	<p>An experienced person designated in writing by the Sector Commander or designee, who has demonstrated the ability to instruct, coach and train and to verify a trainee's ability to correctly perform the task(s) established in the applicable PQS Workbook.*</p> <p>VOs are the only personnel authorized to sign off PQS tasks and must be certified in the competency for the PQS workbook they are endorsing. This includes meeting currency requirements.</p> <p>Certain members at National Centers of Expertise or Commandant (CG-5P-TI) may be designated in writing to serve as National Verifying Officers. These members are not required to have unit-specific VO designation letters. The term VO throughout this document includes National Verifying Officers.</p>

* Taken from the U.S. Coast Guard Sector Organization Manual, COMDTINST M5401.6 (series)

B. COMMERCIAL VESSEL COMPLIANCE PERSONNEL

1. Workforce Classification

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

The Personnel Allowance List (PAL) contains several standard titles for Commercial Vessel Compliance Personnel. All positions, regardless of title, from Apprentice to Chief, Prevention Department, MUST strive to professionally develop proficiency beyond competency attainment. Refer to U.S. Coast Guard Sector Organization Manual, COMDTINST M5401.6 (series), Chapter 3, Section B.4.a for a full description of duties and responsibilities.

Descriptions. A description of the position, paygrades and duties of Commercial Vessel Compliance personnel is as follows:

- a. Marine Inspectors: A marine inspector is an officer or civilian assigned to the inspection division of a field unit to perform the field duties of the Commercial Vessel Safety (CVS) Program. The inspector must understand and apply federal statutes and regulations, Coast Guard policy, and accepted industry standards in the inspection of construction, alterations and repairs, equipment, and operating procedures for various types of vessels. Marine Inspectors are further defined by three levels based on experience and competency:
 - (1) Apprentice Marine Inspector (MI/PSCO APPRENTICE): Junior Officers (O1-O3), Chief Warrant Officers (CWO2), and civilians (GS-7-12). They acquire detailed knowledge of US and International maritime laws, regulations, policies and the maritime industry with the goal of attaining a minimum of four competencies, at least one of which is domestic and one is foreign, to become a Journeyman Marine Inspector.
 - (2) Journeyman Marine Inspector (MI/PSCO JOURNEYMAN): Junior Officers (O2-O4), Chief Warrant Officers (CWO2 and CWO4), and civilians (GS-12 to GS-13) who have completed at least one inspection tour and attained four inspection competencies, at least one of which is domestic and one is foreign. Only certifications for inspected domestic vessels or Port State Control examinations, except PSCE, count toward the required four competencies. Journeymen are expected to continue professional development, pursue Verification Officer status and train new inspectors and vessel examiners.
 - (3) Advanced Journeyman Marine Inspector (MI/PSCO ADV JRNYMN): Junior Officers (O3-O4), Chief Warrant Officers (CWO3-4), and civilians (GS-12 to GS-13) who have more than four competencies and more than six years field experience as marine inspectors. Additionally, Advanced Journeymen have either the K-Boat Inspector (KI), Drydock Inspector (DI), Foreign Tank Vessel Examiner (FTVE), Foreign Chemical Tank Vessel Examiner (FCTVE), Foreign Gas Carrier Examiner (FGCE), Foreign Passenger Vessel Examiner (FPVE), Hull Inspector (HI), Hull Tankship (HT), Machinery Inspector (MI), or Machinery Steam (MS) Inspector competencies. Their job is similar to Journeymen.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

Additionally, they are expected to provide experience and expertise to Inspections Division personnel.

- b. Vessel Examiners: Vessel Examiners are enlisted and civilian personnel who conduct examinations of foreign commercial vessels and U. S. flagged uninspected vessels such as towing vessels and commercial fishing vessels. Depending on the scope of exam and their certification, they may examine vessel lifesaving, firefighting, pollution prevention and navigational equipment, propulsion and steering systems. They inspect and evaluate vessel construction and hull integrity and crew performance of emergency drills.
 - (1) Port State Control Officer/Vessel Examiner (PSCO/VSL EXAMINER): Enlisted Personnel (E-6 to E-9). Pursuant to their competencies these personnel may only lead foreign flag vessels as allowed by Section D1.E of this Manual. They may lead uninspected towing vessel and uninspected commercial fishing vessel exams. They may not issue International Oil Pollution Prevention (IOPP) certificates. A PSCO/VSL EXAMINER is by their nature a specialist and may serve as a Verifying Officer provided the requirements contained in Section D.4 of this chapter are met. Additionally, Chief Petty Officers are responsible for the professional development, technical acumen and leadership qualities of their subordinates.
 - (2) Vessel Examiner (VSL EXAMINER): Enlisted Personnel (E-4 and E-5) and Civilian Personnel (GS-9 to GS-12). Pursuant to their competencies these personnel may assist Marine Inspectors, PSCOs and uninspected vessel examinations. An E-4 or E-5 VSL EXAMINER may serve as a Verifying Officer for the Port State Control Examiner (PSCE) competency provided the requirements contained in Section D.4 of this chapter are met. A Civilian Commercial Fishing Vessel Examiner is a type of Vessel Examiner who has additional duties of managing and marketing their voluntary examination program.
- c. Mid-Management Positions: Mid-management positions are discussed here as they are critical to workforce proficiency.
 - (1) Chief, Inspection Division (INSP DIV CHIEF): Refer to the Sector Organization Manual, Chapter 3, Section B.4.a for a full description of duties and responsibilities. The CID is a Marine Inspector and should maintain currency, when practical, periodically perform inspections and examinations and participate on certification boards. Each CID should utilize the Inspector Proficiency Assessment Tool (IPAT) to assess competency on a different certified MI at least once per quarter (see Section F.3 for more detailed information on the IPAT).

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (2) Marine Inspector Training Officer (MITO): A MITO is a GS-13 Marine Inspector/Training Officer assigned at a Feeder Port who is responsible for managing a unit marine inspector training program and ensuring that apprentices, verifying officers and mentors are meeting HQ and unit professional development and training requirements.
- (3) Inspection Division Branch Chiefs: The Sector organizational construct and PAL do not include Branch Chief positions with the exception of (LT/O-3) FACILITY INSPECTIONS SUPERVISOR at larger ports. In order to maintain span of control it is sometimes necessary to designate personnel as branch chiefs. Assignment as Journeyman and Advanced Journeyman (Apprentices should not be Branch Chiefs) takes precedence over Branch Chief titles. Personnel in these positions are still responsible to earn certifications (as available), maintain currency, perform inspections and examinations and train marine inspectors and vessel examiners.
- (4) Civilian Marine Inspector (GS-12/13): Journeyman and Advanced Journeyman level MIs that provide continuity and depth to the inspection bullpen within a specific port over a prolonged period of time. Because tour lengths are not a consideration for civilian MIs, they are expected to gain all the inspection competencies that are attainable at their specific unit over time.

2. **Civilian Apprentice Marine Inspector (CAMI) Program**

- a. Purpose: The Marine Safety Enhancement Plan outlined a strategic plan to improve the Coast Guard's ability to perform its marine safety mission. A key element of this plan is to deploy a percentage of the marine inspector workforce as Civilian Marine Inspectors with a solid core capacity of qualifications, and to promote mission consistency across the service. The CAMI program was created to have a ready pool of qualified candidates to rotate into vacating civilian Journeyman positions once they have completed their training.
- b. Design: The CAMI program is designed to be a three-year program and provide a structured training platform for CAMIs to gain a solid foundation in marine inspection and port state control knowledge and skills while assigned to a feeder port. Completion of this program is dependent on satisfying the program requirements outline below. Upon successful completion, the CAMI will be designated as a Journeyman Marine Inspector and considered available for transfer to a permanent duty location.
- c. Program Roles and Responsibilities:

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (1) Under standard Office of Personnel Management merit principles, District Command Staff Advisors (CSA) will initiate a recruitment action, via Commandant (CG-1211), to publically advertise all CAMI vacant billets and conduct the selection process.
 - (2) Commandant (CG-CVC) will work with the inbound Feeder Port to select the best candidates to conduct interviews with, and together select a primary and alternate for the position.
 - (3) The District Command staff Advisor will work with the feeder port MITO to provide a new CAMI with unit sponsor contact information. The sponsor will assist the CAMI during transition and to help coordinate a start date. (This date should not be later than 45 business days after accepting the position unless an extension is authorized by Commandant (CG-CVC)).
- d. **CAMI Recruitment and Retention:** All CAMIs are initially offered a GS-7 Step 1 pay grade. COMDT CG-1211 will coordinate available recruitment incentives for newly appointed CAMIs, as follows:
- (1) As outlined in Civilian Recruitment, Relocation, and Retention Incentives, COMDTINST 12500.2 (series), paragraph 10.b., a maximum recruitment bonus of 25 percent of the general schedule pay may be offered.
 - (2) A superior qualification appointment in accordance with Civilian Recruitment, Relocation, and Retention Incentives, COMDTINST 12500.2 (series), paragraph 9, may be authorized up to a GS-7 step 10. This appointment is designed to off-set the forfeiture of income that would have been earned from a non-governmental employment opportunity.
 - (3) Retention beyond the one year probationary period is incumbent on the CAMI meeting the competency and promotion requirements discussed in paragraphs h and j below. Newly reporting CAMIs should be notified about these expectations which should become part of their work plan. If during their 1st year of probation they are not meeting these expectations, they should be immediately counseled and performance shortfalls documented.
- e. **CAMI Transfers:** At the completion of this program, the CAMI is expected to transition into a permanent non-training position as a Journeyman Marine Inspector.
- (1) Sectors shall report all vacant Journeyman Marine Inspector (GS-1801) positions directly to Commandant (CG-CVC) for management directed reassignment of eligible CAMIs prior to contacting the cognizant CSA and announcing the job to the public.

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

- (2) Commandant (CG-CVC), working together with the MITOs will provide receiving units with a candidate pool of CAMIs eligible to transfer.
 - (3) The receiving unit shall conduct interviews in coordination with the CAMIs feeder port and MITO.
 - (4) Once selection has been made, the departing feeder port shall report to their cognizant CSA the name of the selected CAMI, the port they have been selected for, and the agreed upon departure/report date so orders can be cut.
 - (5) If there are no eligible CAMIs, or the eligible CAMIs do not meet the receiving units needs, the unit may submit a request to Commandant (CG-CVC) to pursue an availability announcement to the public. A phone call, email, or memo is acceptable.
- f. Occupational Medical Surveillance and Evaluation Program (OMSEP): All CAMIs are required to enroll in the Occupational Medical Surveillance and Evaluation Program (OMSEP) for Hazardous Waste and Hearing Conservation at a minimum, prior to attending any examinations or inspections. OMSEP is a physical examination established to monitor the health of Coast Guard personnel working in jobs designated as having high health risk potential to chemical or physical agents. Requirements as follows:
- (1) Chapter 12.A.2.c.2 of the Coast Guard Medical Manual, COMDTINST M6000.1 (series); enrollment for a CAMI is based on the specific job assignment as a marine inspector who is actively engaged for 30 or more days per calendar year. More information can be found at the OMSEP home page, <https://hswl.uscg.mil/kseOmsep/>. The Evaluation and Enrollment Tool can be found under OMSEP Tools.
 - (2) Chapter 12.A.5.g of the Coast Guard Medical Manual, COMDTINST M6000.1 (series); civilian employees are entitled to OMSEP services provided by Coast Guard medical facilities. CAMIs should contact their local Safety and Environmental Health Officer (SEHO) and receive instruction on how to schedule a baseline examination (at no out-of-pocket cost). A current list of SEHOs can be found at <https://cg.portal.uscg.mil/units/hswlsc/SafeEvHealth/SitePages/Home.aspx> using the link, Contacts.
- g. CAMI Formal Training:
- (1) Through the Coast Guard Learning Management System (LMS) found in the CG Portal, CAMIs must complete the following on-line mandated training courses within 60 days of obtaining a CG standard workstation account:

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (a) Civilian Orientation (502281): The purpose of this course is to provide basic information to all new civilian employees about the Coast Guard as an organization, civilian job resources, and professional development; and,
 - (b) Information Systems Security (810010): The purpose of this course is to provide minimum awareness to CGSW users on the current requirements, mandates, or policies set forth by OMB, DHS, DoD, and the CG.
- (2) As soon as a new CAMI receives an employee identification number, supervisors shall ensure an electronic training request (ETR) is submitted for either the Marine Inspector Course (501869) or the Port State Control Course (501864). In order to meet program requirements, CAMIs will attend both courses within their first two years of employment and Commandant (CG-CVC) shall grant top priority to CAMIs for selection to both courses. When requesting a C-school, supervisors shall also ensure the Introduction to Confined Space Entry and Shipyard Competent Person for Marine Inspection/Port State Control (100028) course is completed prior to attending these courses.
- (3) MITOs should continually seek professional development opportunities for their assigned CAMIs within the maritime industry. Working with classification societies, shipyards, or other local marine transportation companies are normally very successful. These training opportunities are welcomed by the industry as they are extremely helpful in developing relationships as well as improving partnership knowledge of the maritime sectors that the Coast Guard regulates. At the conclusion of the training.
- h. Proficiencies: To successfully complete this program, CAMIs will need every opportunity to concentrate on their training plan. During this program, CAMIs should not be tasked with duties outside their position description such as carrying collateral responsibilities. The CAMI position description is available at Commandant (CG-CVC).
- (1) Once the minimum required proficiencies have been achieved as outlined below, additional responsibilities may be added. Supervisors should only consider CAMI attendance at after-hours inspections if the training opportunity is not otherwise available during normal work hours and provided that the training is in line with the CAMI's work plan.
- (2) CAMIs are directed to Section A, paragraph C, for guidance on completing Performance Qualification Standards (PQS) workbooks and requesting certification. PQS workbooks are available at <https://elearning.uscg.mil/catalog/>, located under the Marine Safety section.
- (3) To ensure CAMIs are well-rounded, it is important that CAMIs become proficient in both domestic inspections and port state control. Supervisors will identify the

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

required proficiencies in the CAMI's work plan based on the competencies attainable at their particular feeder port. The Port State Control Examiner (PSCE) competency is attainable at all feeder ports and must be obtained as a pre-requisite by all CAMIs.

i. Paygrade specific CAMI proficiency requirements:

(1) GS-1801-7: Proficiency needed at this level are:

- (a) Attend the Marine Inspection Course (501869) or Port State Control Course (501864).
- (b) Fundamental knowledge of prevention operations, policies, methods, and procedures with regards to marine safety programs.
- (c) Ability to conduct appropriate pre-inspection review for a particular class of vessel and any available previous inspection histories in preparation of assigned vessels or systems.
- (d) A working knowledge of computer systems related to job responsibilities, such as MISLE, Lloyd's Register, IMO, SafeNet, etc.
- (e) Ability to perform routine inspections/examinations under supervision on domestic/foreign vessels and other marine structures for compliance with the applicable statutory/international requirements.
- (f) Ability to evaluate basic systems and vessels for compliance with straightforward specifications and requirements.
- (g) Knowledge of basic inspection procedures & techniques in accordance with the laws, regulations, and precedents governing inspections to perform developmental assignments or segments of larger inspection actions.
- (h) Prepare technically accurate and timely reports of inspections and examinations performed.
- (i) Develop the ability to communicate, orally and in writing, pertinent information relative to assigned area of study.
- (j) Obtain at least two (2) vessel specific competencies as outlined in the appropriate feeder port's attainable list.

(2) GS-1801-9: In addition to the proficiencies described for the GS-7 level, proficiencies needed at this level are:

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (3) Ability to inspect required navigation, intra-vessel communication, alarm, lifesaving, fire fighting, and pollution prevention systems on a vessel to ensure that proper operations and compliance with applicable national and international standards.
 - (4) Capability of identifying hazardous conditions, note violations of accepted vessel specifications and operations technology, and prescribe acceptable methods of correcting these conditions.
 - (5) Accurate inspection documentation preparation; including appropriate orders drafted specifying any required changes, repairs or operational limitations for the vessel and its equipment. When deficiencies are noted, CAMI evaluates the impact of the deficiency, directs appropriate corrective measures and prepares appropriate documents to notify the vessel owner/operator of the corrective measures required.
 - (6) Ability to read engineering plans and have a basic understanding of shipbuilding practices and vessel operations.
 - (7) The professionalism, judgment and responsibility necessary to understand the impacts of decisions made regarding safety standards (including acceptable concession on the operations, repairs, replacements, etc) on vessel operations and on local industry and commerce.
 - (8) Understanding and comprehension of the USCG's strategic, technical and regulatory position in the marine industry (e.g., CG literature - The Proceedings, Mission Performance Plans, CG Authorization Bills, etc. Industry literature - stay current on industry release publications)
 - (9) Ability to prepare professional briefing papers, technical analyses, and optional evaluations for the Officer-in-Charge, Marine Inspection, where inspection decisions may have broad impact on an industry, are controversial in nature, or are expected to be appealed to higher authority.
 - (10) Obtain two (2) more competencies for a total of four (4) competencies as outlined in the appropriate feeder port's attainable list with at least one (1) being a Port State Control vessel competency.
- j. **Promotion:** If all of the required levels of proficiency have been met; a CAMI's promotion schedule is to start as a GS-7 and promote to GS-9 on the first anniversary. Upon the second anniversary, the CAMI is expected to promote to a GS-11. Finally, the CAMI is expected to promote to a GS-12 on the third anniversary. In order to promote on schedule, the following minimum criteria must be met:

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (1) For promotion from a GS-7 to GS-9:
 - (a) Receive a 'meets' or 'exceeds' on all performance evaluations; and,
 - (b) Earn at least two (2) competencies as outlined in the appropriate feeder port's list of attainable and sustainable competencies.
 - (2) For promotion from a GS-9 to GS-11:
 - (a) Receive a 'meets' or 'exceeds' on all performance evaluations; and,
 - (b) Earn at least two (2) additional competencies as outlined in the appropriate feeder port's list of attainable and sustainable competencies. At the completion of the second year and before promotion to GS-11, the total number of competencies earned must be at least 4, not including the PSCE competency.
 - (3) For promotion from a GS-11 to GS-12:
 - (a) Receive a 'meets' or 'exceeds' on all performance evaluations; and,
 - (b) Throughout the one year time-in-grade, actively seek assignment to a permanent journeyman marine inspector billet.
 - (4) To avoid promotion delays, supervisors shall submit Request for Personnel Action, SF-52 to their District Command Staff Advisor (CSA) one month in advance of a CAMI's anniversary date; provided that the CAMI meets the above criteria. Career ladder promotions can be enacted without further authorization as these positions are approved for a full performance level of GS-12. Performance evaluations are not required to accompany promotion requests.
- k. **Relocation:** Relocation to perform marine inspection duties at a journeyman level is expected after completion of training. A CAMI that is promoted to a GS-12 and continues to occupy the training billet will be subject to the Mobility Certificate Agreement.
- l. **Waiver.** A Feeder Port Commanding Officer that anticipates a CAMI not complete the requirements for promotion as prescribed in this policy and determines the reason was outside the CAMI's control, he or she shall, prior to deviating from the above promotion track, submit a memo to Commandant (CG-CVC):
- (1) Identifying the reason for deviation (examples may include: need to shift resources due to significant unplanned events such as spills of national significance, employee is recalled to an active duty obligation, or limited availability to perform vessel

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- inspection activity because of reduced vessel traffic); and,
- (2) Propose an alternative training timeline for the CAMI to fulfill the required competencies.
-
-

C. FEEDER PORT PROGRAM

1. Designation

- a. General. Feeder ports are designated by Commandant (CG-CVC) based on a unit's attainable and sustainable competencies. Units that feel they possess the necessary inspection and examination workload, training program, and resource capacity to be designated as a feeder port must submit a request to Commandant (CG-CVC) in standard memo format. Commandant (CG-CVC) will coordinate the review of the request to include historical and current MISLE activities, competency cubes in CGBI, Personnel Allowance List staffing levels, Mission Management System and MITO peer audit results, and any other factors for consideration.
- b. Attainable and Sustainable Competencies. Annual review of attainable and sustainable competencies at Feeder Ports will be conducted by Commandant (CG-741), validated by feeder ports and approved by the Prevention Performance Advisory Committee (PPAC). Since the Sector Staffing Model relies on historic MISLE data over a period of time, new activities or the removal of historic activities at a feeder port should be documented and forwarded to Commandant (CG-CVC) and Commandant (CG-741) for the annual review. (i.e., shipbuilding contracts, a new LNG terminal, removal of a MARAD fleet, etc; could impact activities and needed or "Sustainable" competencies.)
- (1) Attainable competencies are those competencies that can be obtained at a specific unit due to the frequency of that particular activity. The minimum activity level in the Sector Staffing Model (SSM) for a competency to be considered attainable is 451 hours of training opportunities for each vessel type. SSM calculations are vetted by feeder port MITOs to account for recent changes or anomalies in the data and to validate workload in respective ports.
- (2) Sustainable competencies are those competencies that can be maintained (for currency) at a specific unit due to the frequency of that particular activity. The minimum activity level in the SSM for a competency to be considered sustainable is between 29 hours and 450 hours of training opportunities for each vessel type.
-

2. Staffing

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- a. General. A sufficient ratio of Journeyman Marine Inspectors to Apprentice Marine Inspectors must be maintained. Due to larger needs of the service and availability of Journeyman Marine Inspectors, it is possible that OPM may have to assign Apprentice Marine Inspectors to Journeyman billets and in limited cases to Non-Feeder Ports. In these cases, these personnel must make every attempt available to attain requisite competencies.
- b. Marine Inspector Training Officer (MITO)
- (1) Description. MITOs are responsible for the technical development of marine inspectors as evidenced by competency attainment and the further development of proficiency. Examples of further development include Verifying Officer status and professional certifications.
 - (2) Duties. In their Position Description, a MITO is titled a Senior Marine Inspector/Training Officer. This means their responsibilities include a mix of performing inspections, training others and managing the unit's marine inspector training program. The degree to which each MITO is a hands on trainer versus a manager of training has to be determined locally based on the unit's specific workload, size and quality of the bullpen and availability of VO's. MITOs should maintain currency of their certifications and should be a technical expert for the attainable qualifications at their unit.
 - (3) Authority. MITOs typically work directly for the Chief, Inspections Division because of the responsibilities of training marine inspectors. MITOs evaluate work performance of AMIs and VOs and provide feedback to both the individual and supervisor in a timely manner. MITOs are to take appropriate performance based action if necessary; giving advice, counsel, or instruction to employees on both work and administrative matters. Per their position description, MITOs have direct input into personnel evaluation marks to document performance and proficiency in keeping with unit training strategy and Individual Development Plans.
 - (4) Supervisory Responsibility: Depending on the terms of hiring documented in their individual position description, not all MITOs are considered "supervisors" in the sense of being able to formally evaluate active duty members or other civilian employees. Regardless, MITOs are responsible for supervising the training-related efforts of marine inspectors. Careful attention must be paid to the fact that the development of an officer as a marine inspector and CG officer overlap significantly but are not synonymous. MITOs train officers to become marine inspectors which is one aspect of their career development.
- c. Expectations.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (1) Feeder Ports are expected to develop apprentices to attain a minimum of four attainable competencies, specific to that feeder port, with an emphasis on domestic vessel inspections and foreign vessel examinations.
 - (2) PSC Examiner (PSCE), Liferaft Inspector (LR), Commercial Fishing Vessel Examiner (CFV), and Uninspected Passenger Vessel Examiner (UPV) do not count as one of the four competencies an apprentice marine inspector must attain for a successful first tour.
 - (3) This does not prohibit marine inspectors from attaining any specific competencies, including those listed in paragraph D.1.d(2) above. Marine Inspectors are encouraged to make the most of every training opportunity and seek out additional opportunities.
 - (4) Progress is tracked through the Feeder Port Progress Report, administered by Commandant (CG-5P-TI). The report utilizes TMT and DA certification/qualification data and is published every three months, February, May, August and November. The data provides critical trend data to determine the effectiveness of training policy and decisions.
- d. Use of Apprentices: Apprentice MIs will spend their full tour as Apprentice MIs. As such they will pursue all qualifications available at the unit and once qualified will conduct inspections independently to gain expertise in that competency. The ability of Apprentice MIs to work independently once qualified will offset the training loads experienced by the core Journeyman MIs at the unit. In some cases, Apprentice AMIs may have the opportunity to gain qualifications in competencies normally only sustainable at the unit. Non-MI related collaterals and duties should be minimized. For professional development reasons, junior officers training to be MI's may need to assume certain collateral duties, those should only be assigned when necessary and taking into account the impact on the officer's professional development as both an MI and Coast Guard Officer.
- e. Apprentices as PQS Verifying Officers: Apprentice MIs should not be PQS Verifying Officers for other Apprentice MIs unless they meet the requirements contained in Section D.4 of this chapter.

D. TRAINING AND CERTIFICATION PROCESS

1. Performance Qualification Standards (PQS Books) and Inspection Guides

USCG Marine Safety Manual, Vol. II: Materiel Inspection

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

The most recent PQS Workbook must be utilized by Marine Inspectors and Vessel Examiners during training. The most recent editions of these PQS workbooks are available through the Coast Guard Learning Management System, under Maritime Safety in the Course Catalog.

All pre-requisites must be met unless the PQS specifically allows deferment or delay. See U.S. Coast Guard Sector Organization Manual, COMDINST M5401.6 (series), Chapter 8.E for specific requirements when deferring a PQS item.

Some PQS Workbooks have vessel specific addendums. For those types of vessels, the addendum is required to be completed prior to examination or inspection of that particular vessel type. For example, to qualify for an endorsement to examine Foreign Ro-Ro Passenger Vessels you will be required to complete the specific tasks and steps associated with Ro-Ro vessels which are incorporated in the addendum workbook.

Units may also develop unit-specific requirements in addition to the PQS that address local policies, procedures and operations.

All Verifying Officers (VO) must be familiar with the PQS content, particularly the task, condition, steps, and VO Guidance. Not all steps supporting a task need to be completed at the same time, however, all steps must be completed prior to signing off the task. Additionally, the VO must take into account the VO guidance when determining successful completion of a step and task.

2. Competency Applicability Tables

Competency Applicability (US Flag Vessels)			
Vessel Subchapter (46 CFR)	Vessel Type	Competency to be used	Competency Dictionary Code
C Uninspected Vessels	Fishing Vessel	Commercial Fishing Vessel Examiner	CVSFSE
C Uninspected Vessels	Uninspected Towing Vessel	Uninspected Towing Vessel Examiner	CVSUT
D Tank Vessels	Tankship	Hull Inspector (Tankship) Machinery Inspector (Diesel) as appl. Machinery Inspector (Steam) as appl.	CVSHT CVSMI CVSMS
D Tank Vessels	Tank Barge	Barge Inspector	CVSBI
H	Cruise	Hull Inspector	CVSHI

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

Passenger Vessels	Ship Ferry	Machinery Inspector (Diesel) as appl.	CVSMI
I Cargo & Misc. Vessels	Freight Ship	Hull Inspector Machinery Inspector (Diesel) as appl. Machinery Inspector (Steam) as appl. (OSVs inspected under Subchapter I only requires the CVSOI competency)	CVSHI CVSMI CVSMS
I-A	MODUs	Mobile Offshore Drilling Unit Inspector	CVSMU
K Small Passenger Vsl >150	K-Boat	K-Boat Inspector	CVSKI
L Offshore Supply Vessels	OSV	OSV Inspector (Some OSVs are inspected under 46 CFR Subchapter T; in these cases the CVSTI competency is also required.)	CVSOI CVSTI
R Nautical Schools	Schoolship	Hull Inspector Machinery Inspector (Diesel) as appl. Machinery Inspector (Steam) as appl. (Some schoolships are certificated under subchapters T or K. In these cases a CVSTI or CVSKI competency would be required)	CVSHI CVSMI CVSMS CVSTI CVSKI
T Small Passenger Vessels	T-boats	Small Passenger Vessel (T-boat) Inspector	CVSTI
U Oceanographic Research Vessel	ORV	Hull Inspector Machinery Inspector (Diesel) as appl. Machinery Inspector (Steam) as appl. (Some ORVs are certificated under subchapters T or K. In these cases a CVSTI or CVSKI competency would be required)	CVSHI CVSMI CVSMS CVSTI CVSKI

Note: The Competency Dictionary with all Competency Codes can be found at <http://www.uscg.mil/ppc/da/>

USCG Marine Safety Manual, Vol. II: Materiel Inspection

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

Competency Applicability (Foreign Flag Vessels)		
Vessel Service	Competency to be used	Competency Dictionary Code
Freight Ships	Foreign Freight Vessel Examiner	CVSFV
Tank Ships (Oil)	Foreign Tank Ship Examiner	CVSTV
Chemical Carriers	Foreign Chemical Tank Vessel Examiner	CVSML
Gas Carrier	Foreign Gas Carrier Examiner	MARFGCE
Cruise Ship	Foreign Passenger Vessel Examiner	MARFPVE
MODU/Offshore COC	Foreign MODU/offshore installations requiring a COC	CVSMU
All	Port State Control Examiner – Cannot lead exam	MARPSC

3. Maintaining and updating PQS books and Inspector Guides

- a. Ownership. Marine Inspector and vessel examiner PQS books and Inspection Books are owned by Commandant (CG-CVC). Commandant (CG-CVC) has final approval of PQS book changes in consultation with the Prevention Performance Advisory Committee (PPAC).
- b. Administration and Maintenance. The administration and maintenance of PQS books and Inspection Guides lies with the Training Center Yorktown Marine Safety School (FC-TCY-TM) as follows:
 - (1) FC-TCY-TM maintains process guides to detail organizational relationships, procedures, and timelines for maintaining, reviewing and updating PQS books and Inspection Guides. Major and Minor changes are defined and their adjudication is also described.
 - (2) Specifically, FC-TCY-TM will:
 - (a) gather, draft, and issue changes to all Marine Inspection PQS and job aids,
 - (b) conduct routine annual review to assess the need for minor changes based on user feedback,
 - (c) Solicit input from Course Administrators and National Center of Expertise subject matter experts as well as field users to assess the need for a significant change

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

involving the addition or removal of a task recommended by user feedback.
Additional or removal of a task requires Commandant (CG-CVC) concurrence.

4. Verifying Officer Performance

- a. Verifying Officers (VO) are the backbone of marine inspector training. Selection as a VO demonstrates that a Marine Inspector or Vessel Examiner has demonstrated exceptional professionalism and technical expertise. As such, it should be a highly sought after designation and assigned judiciously. It is not an automatic designation.
- b. Each VO must meet the following minimum requirements :
 - (1) The VO shall have already obtained formal designation in writing by the OCMI and be current for the certification for which he / she is being considered as a PQS Verifying Officer,
 - (2) The VO shall have the confidence of the Chief, Inspections Division, and Marine Inspection Training Officer or Training Manager and meet at least one of the following requirements:
 - (a) Be a Journeyman Marine Inspector, or
 - (b) Be an Apprentice Marine Inspector (AMI), a Civilian Apprentice Marine Inspector (CAMI) or a Vessel Examiner who has held the certification for which VO designation is being sought for a period of not less than six months.
- c. Formal Evaluation as a PQS Verifying Officer. Once the minimum requirements of paragraph 4.b. are met, units shall conduct a formal evaluation of the Marine Inspector's or Vessel Examiner's potential as a VO. Marine Inspectors or Vessel Examiners who already hold the VO designation for the certification being sought shall conduct the formal evaluation. The formal evaluation consists of two parts: an IPAT evaluation on a vessel specific to the competency and an evaluation of the VO candidate's ability to train and evaluate a trainee's performance using the criteria below:
 - (1) Technical expertise (can effectively evaluate a trainee's understanding of technical concepts),
 - (2) Training knowledge (possesses an in depth understanding of the unit's training program),

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (3) Job-task knowledge (possesses comprehensive understanding of each of the PQS tasks for the competency in question),
 - (4) Interpersonal skills (can effectively interact with different trainees and evaluate their technical ability and comprehension),
 - (5) Attitude (possesses an attitude that promotes learning and professional development),
 - (6) Listening ability (can listen and understand different trainees during the verification process),
 - (7) Degree of patience (can adjust to different types of learners),
 - (8) Accessibility to trainees (is available to trainees),
 - (9) Communications skills (can effectively communicate when explaining inspection concepts to trainees),
 - (10) Willingness to follow certification requirements (committed to training and verifications in accordance with established policy), and
 - (11) Judgment (make recommendations to the OCMI regarding a trainee's ability to effectively represent the Coast Guard as a certified inspector).
- d. Expectations for PQS Verifying Officers. PQS tasks shall only be signed off by command designated VOs. Command designated VOs must have demonstrated an ability to effectively instruct and evaluate marine inspectors in the performance criteria established for their VO competency. In conducting the functions of a VO, the below sequence shall generally be followed. Under certain circumstances, steps below may be omitted given the experience level of the trainee, however this should only be done after the VO has carefully considered the trainee's experience and knowledge concerning the task being conducted. At a minimum, steps (4) and (5) must be completed.
- (1) Step One: VO Explains and Demonstrates. The VO shall demonstrate the performance of the task while explaining the process using proper nomenclature and procedures,
 - (2) Step Two: VO Demonstrates and Trainee Explains. While the VO demonstrates the task, the trainee is given the opportunity to verbalize his / her understanding of the concepts. This is not the evaluation of the task. The VO may coach the trainee through this process if necessary and reinforce trouble areas for comprehension.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (3) Step Three: Trainee Demonstrates and VO Explains. Hands-on is a must for performance training. The trainee will perform the task with as much coaching as needed from the VO. Communicate constantly during the process to ensure the trainee understands his / her actions. The VO must closely monitor the trainee's performance for safety precautions and concerns.
- (4) Step Four: Trainee Explains and Demonstrates. This is not the evaluation of the task. The trainee must be provided opportunities to practice the task. The number and frequency of this step will be determined by the VO depending on the proficiency of the trainee.
- (5) Step Five: Task Endorsement. Once the VO is satisfied the trainee has demonstrated a satisfactory understanding of the task being performed using the guidelines above, the task item may be signed off. VOs must ensure that they are evaluating the trainee's ability to meet the current requirements identified for the specific task and guard against requiring them to go beyond those requirements.

5. Commercial Vessel Compliance Personnel Verification Inspections/Exams

- a. Method. Field practical verification inspection/examination (check ride) shall be conducted with the trainee as the team leader under the direct supervision of a VO. The VO shall assess whether the trainee has the necessary judgment, knowledge and communications skills to successfully conduct the inspection / examination. The VO should only intervene if absolutely necessary. Multiple trainees shall not be evaluated during the same vessel activity with the exception of U. S. flag deep draft vessels that require both a Hull and Machinery Inspector. The VO shall utilize the IPAT plus Appendix 1 to this Chapter to standardize assessment. Data from Appendix 1 is not uploaded into the IPAT data site. Feedback shall be provided to the trainee and IPAT data shall be entered in accordance with current IPAT processes.
- b. Rigor. Additionally, efforts shall be made on the part of the MITO/TO to ensure that the trainee has not only accomplished individual tasks for a competency but has a broader understanding of the competency requirements and can readily access and interpret regulations and policy. Methods such as a written test or pre-board will prove useful in this determination.

6. Merchant Marine Indoctrination Ship Rider Program and Industry Specific Orientation

To provide an understanding of the maritime industry as well as specific segments of the industry and ships we regulate, the Coast Guard has developed two types of industry orientation

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

training for marine inspectors; the Merchant Marine Indoctrination (MMI) Ship Rider program and Industry Specific Orientation training. Completion of these training programs will provide valuable professional exchange opportunities for the mutual benefit of both the Coast Guard and the merchant marine industry.

- a. MMI Ship Rider Program. The MMI Ship Rider Program is a cooperative educational program between the Coast Guard and participating host ship companies. By providing opportunities for Coast Guard Marine Inspectors to join a vessel's crew while underway and act as a riding observer, the program gives the ship rider practical knowledge of the performance and operating characteristics of various vessels, equipment, waterways, and crews operating within the maritime industry. The program is designed for first tour Coast Guard marine inspectors as part of their introductory phase into vessel inspections. It's especially useful for those new marine inspectors who have little or no shipboard experience, as it will provide the relevant background knowledge to assist in marine inspector training. It is expected that all first tour apprentice marine inspectors with little or no commercial shipboard experience will complete a MMI ship ride prior to completing their initial apprentice marine inspection tour. Details on the MMI Ship Rider Program can be found in Coast Guard Merchant Marine Indoctrination (MMI) Ship Rider Program, COMDTINST 16705.1(series).
 - (1) Coast Guard Merchant Marine Indoctrination (MMI) Ship Rider Program, COMDTINST 16705.1(series) states that "The program also serves to increase and expand marine inspector knowledge of the maritime industry in their unit's area of responsibility. As such, the program may be utilized by Marine Inspectors to understand different operating requirements, characteristics or vessel types upon transfer to units with unique or different inspected vessels." The Liquefied Gas (LG) Ship Rider Program is an example of such a program.
 - (2) The Liquefied Gas Carrier National Center of Expertise (LGC NCOE) manages the LG Ship Rider Program. The program's intent is to give experienced Foreign Gas Carrier Examiners (FGCEs) a comprehensive understanding of LG ship operations. While the program is targeted at qualified FGCEs, units may arrange for a FGCE Verifying Officer to accompany an apprentice FGCE to assist in PQS completion. Requests for the LG Ship Rider Program should be coordinated through the LGC NCOE.
 - (3) During the LG ship ride, participants must complete the Liquefied Gas Ship Rider Performance Guide and the associated post-ship ride survey. The performance guide can be found on the LGC NCOE CGPortal site. LG ship rider participants must submit a copy of the completed Performance Guide to the LGC NCOE, through their chain of command, for feedback and action.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- b. Industry Specific Orientation. Industry Specific Orientation training is designed to develop a foundational understanding of a specific vessel industry and includes a series of tasks that must be completed as part of the marine inspection qualification process. These tasks include ship rides or shoreside tasks appropriate for that particular industry and vessel type. All marine inspection performance and qualification standards (PQS) now include enclosures that require Industry Specific Orientation training. This orientation training is more easily adaptable to non-seagoing vessels or vessels with short voyage durations such as T-boats and certain towing vessels. All current PQS are available on the Learning Management System within the Coast Guard Portal.
- c. Industry Specific Orientation training is not a substitute for conducting a ship ride as part of the MMI Ship Rider Program. However, a marine inspector may complete specific Industry Specific Orientation training PQS tasks while participating on a MMI ship ride. It is up to the marine inspection training officer (MITO) or unit training officer to properly manage a marine inspector's training and qualification process to ensure the intent and goals of each program are met.

7. C-School Training

MITOs or Unit Training Officers should coordinate C-School training requests for their unit. Below are a list of mandatory and additional courses applicable to Marine Inspectors and Vessel Examiners as well as information regarding course waivers. Course prerequisites (and the process for requesting waivers from the prerequisites), descriptions, and requirements are available on the TQC website at <http://www.uscg.mil/hq/tqc/>.

- a. Mandatory.

- (1) Marine Inspector Course (Domestic) – Course Code 501869
- (2) Port State Control (PSC) – Course Code 501864.

(Note: Marine Science Technicians (MSTs) who have graduated from MST A-School after 27 January 2010 are not required to attend the PSC Course.)

- b. Mandatory for earning a competency.

- (1) Advanced Foreign Passenger Vessel Examiner – Course Code 500317 (Required for Foreign Passenger Vessel Examiner certification)
- (2) Gas Carrier Inspector (Gas) (MS-513) – Course Code 351263 (Required for Foreign Gas Carrier Examiner certification)

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**c. Additional.

- (1) Chemical Tanker Safety (MS-525) – Course Code 250540
- (2) Commercial Fishing Vessel Exam (MS-527) – Course Code 500304
- (3) Crude Oil Wash/Inert Gas (COW/IG) (MS-404) – Course Code 250257
- (4) Diesel/Steam Automation (MS-507) – Course Code 250015
- (5) Fiberglass Reinforced Plastic and Wooden Boats (MS-454) – Course Code 340210
- (6) Outer Continental Shelf Inspection (MS-514) – Course Code 250269
- (7) T-Boat Structural Plan Review (MS-520) – Course Code 400479
- (8) Uninspected Towing Vessel Exam – Course Code 502234

d. Waivers from mandatory courses. Due to high quota demand, Commandant (CG-CVC-2) instituted a waiver process for the Port State Control course.

- (1) This process shall only be used when the following conditions are met:
 - (a) The candidate has completed the PSCE PQS,
 - (b) The candidate has successfully conducted the required verification exam,
 - (c) The candidate has passed the oral PSCE certification board, and
 - (d) The unit has submitted at least 2 previous electronic training requests (ETRs) for the course and has not received a quota.

OR

- (e) The candidate has completed (a) – (c) above and the command must have the candidate qualified before the next PSC course convening in order to effectively perform PSC activities.
- (2) Personnel with the legacy EI, SFV or SFVA qualifications are eligible for a PSC course waiver, without completing (a) – (c) above, provided the unit has submitted at least 2 previous ETRs for the course and has not received a quota.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (3) Requests for a waiver shall be submitted in standard memo format, signed by the Chief, Prevention Department or higher, to Commandant (CG-CVC-2) with the following information:
 - (a) A statement that the candidate has completed the PSCE PQS, successfully conducted the verification exam, and passed the oral PSCE certification board.
 - (b) The amount of time the candidate has been conducting PSC exams and number and type of vessels examined during the certification process.
 - (c) How long the candidate has been waiting to attend the PSC course.
 - (d) A description of any other vessel or PSC related training or professional education.
 - (e) Any other input the unit wishes to submit to justify the waiver.
 - (4) Commandant (CG-CVC-2) will review the waiver package and determine if a waiver is appropriate. If so, Commandant (CG-CVC-2) will send a PSC Course Waiver Exam to verify the candidate has an equivalent level of knowledge as those who have completed the PSC course. The exam package will include specific instructions for the unit and the candidate on proctoring and returning the exam.
 - (5) Commandant (CG-CVC-2) will respond via memo with the exam results.
 - (a) Candidates that pass the exam will receive a memo that states that the PSC course requirement is waived.
 - (b) Candidates that fail the exam will receive a memo that the PSC course requirement is not waived and that they may request a retest after 6 additional weeks of on-the-job training. If the candidate fails the exam a second time, they must attend the PSC course prior to receiving any additional PSC certifications.
 - e. Waivers from mandatory courses for earning a competency. Units should refer to the preamble of the applicable PQS for information on course waivers and prerequisite deferment.
-

8. Competency Management

- a. Training Management Tool (TMT).

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (1) Use of the Training Management Tool is required by Mandatory Use of the Training Management Tool, COMDTINST 5270.2(series).
 - (2) Units must assign competencies to individuals when they are first directed to pursue those competencies. Once certified, units must reflect that change in TMT. The practice of assigning and certifying personnel simultaneously once they receive their certification is unacceptable.
- b. Direct Access. Certain data systems draw information from Direct Access rather than TMT. For instance, Direct Access data is the basis for the Employee Summary Sheet which is routinely used by selection boards and other panels. Marine Inspectors and Vessel Examiners should ensure their competencies are correct in Direct Access in addition to TMT.

E. MAINTAINING CERTIFICATIONS AND CONTINUED PROFESSIONAL DEVELOPMENT

1. Currency

- a. Twelve Month Currency Requirement: To remain certified, MIs, PSCOs and Vessel Examiners shall conduct at least one inspection / examination every twelve months for each competency required by the OCMI. This can be accomplished as the team leader, lead inspector or as a team member. The following are competencies listed with the activities that are acceptable towards meeting the twelve month currency requirement:
- (1) Domestic Competencies:
 - (a) Life raft Inspector: Completion of a life raft servicing inspection.
 - (b) T-Boat Inspector (TI): Completion of a COI or annual inspection of a U.S small passenger vessel regulated under subchapter T or subchapter K.
 - (c) K-Boat Inspector (KI): Completion of a COI or annual inspection of a U.S. small passenger vessel regulated under subchapter K.
 - (d) Barge Inspector (BI): Completion of a COI, annual, or periodic inspection of a U.S. barge regulated under subchapter D, I, or O.
 - (e) Offshore Supply Vessel Inspector (OI): Completion of a COI, annual, or periodic inspection of a U.S. offshore supply vessel regulated under subchapter L.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (f) Hull Inspector (HI): Completion of the Hull Inspection tasks for a COI, annual, or periodic inspection of a U.S. deep draft vessel regulated under subchapter H, I, R, or U.
- (g) Hull Inspector, Tankship (HT): Completion of the Hull Inspection tasks for a COI, annual, or periodic inspection of a U.S. deep draft vessel regulated under subchapter D or O.
- (h) Machinery Inspector (MI): Completion of the Machinery Inspection tasks for a COI, annual, or periodic inspection of a U. S. deep draft vessel regulated under subchapter D, H, I, O, R, or U.
- (i) Machinery Inspector, Steam (MS): Completion of the Machinery Inspection tasks for a COI, annual, or periodic inspection of a U.S. steam propelled deep draft vessel regulated under subchapter D, H, I, O, R, or U.
- (j) Mobile Offshore Drilling Unit Inspector (MU): Completion of a COI, annual, or periodic inspection of a U.S. mobile offshore drilling unit regulated under subchapter I-A.
- (k) Drydock Inspector (DI): Completion of a dry-dock inspection, internal structural exam, or cargo tank internal exam of a U.S. vessel of 100 gross tons or more.

Note: Completion of Streamlined Inspection Program, Alternate Compliance Program, or Maritime Security Program audits and oversight inspections conducted in lieu of traditional regulatory inspections satisfy certification requirements for applicable Marine Inspector competencies.

(2) Port State Competencies:

- (a) Port State Control Examiner (PSCE): Completion of a PI, PII, Random Safety, COC-Annual, COC-Renewal, or COC-Quarterly examination on any foreign commercial vessel type. This competency is also considered certified if any other Foreign Vessel Examiner competency is maintained certified.
- (b) Foreign Freight Vessel Examiner (FFVE): Completion of a PI, PII, or Random Safety examination on a foreign freight vessel.
- (c) Foreign Tank Vessel Examiner (FTVE): Completion of a PI, PII, COC-TVE Annual, or COC-TVE Renewal examination on a foreign petroleum tank vessel.
- (d) Foreign Chemical Tanker Examiner (FCTE): Completion of a PI, PII, COC-Chem Annual, or COC-Chem Renewal examination on a foreign chemical carrier.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- (e) Foreign Gas Carrier Examiner (FGCE): Completion of a PI, PII, COC-Gas Annual, or COC-Gas Renewal examination on a foreign gas carrier.
- (f) Foreign Passenger Vessel Examiner (FPVE): Completion of a PI, PII, COC-CVE Initial, COC-CVE Annual, or COC-CVE Quarterly examination on a foreign passenger vessel.
- b. Lapse of Twelve Month Currency Requirement: Those MIs, PSCOs and Vessel Examiners who have not performed a particular inspection / examination type during any twelve month period will have lapsed in currency for that specific competency. They are therefore no longer certified and are not authorized to lead foreign vessel exams or domestic vessel inspections. Members with lapsed currency can only be recertified by completing a field practical (check ride).
- c. Documentation: All Letters of Certification shall be documented in writing by the OCMI with appropriate entries made in TMT. The OCMI may issue a Certification endorsement to the member's original letter of certification. Previously deferred items that have been satisfactorily demonstrated shall be clearly documented on the form and endorsement as they are no longer considered deferred. A copy of the form or endorsement shall be kept in the individual's training record.
- d. Alternatives if Units Cannot Comply with Currency Requirements: In instances where a unit could not fully comply with the currency requirements and an activity needs to be conducted by a certified MI/PSCO one of the following alternatives should be used:
 - (1) Deferral: If possible, in accordance with existing policy/regulation, defer the activity to the next U.S. port.
 - (2) Request for Forces: The OCMI should send a Request for Forces to their cognizant District to request assistance for a certified MI or PSCO.
 - (3) Competency Specific Refresher Training: The OCMI shall ensure robust refresher training is conducted covering the applicable competency and the specific inspection / examination activity scheduled. The training should be conducted by the most competent and experienced member at the unit that holds the applicable competency provided the member has been certified for the competency within the last five years. MITOs shall document the refresher training as a task capture in TMT.
- e. Collaboration. Units are encouraged to network with other units, Feeder Ports and NCOEs to maximize training opportunities, obtain training materials, maintain currency and ensure consistency with national standards.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

NCOEs serve as subject matter experts and a repository of best practices, assist and collaborate with the Marine Safety School, and enter into working relationships with the maritime community. From a training perspective, NCOEs are available to assist with the inspection/examination of specific vessel types, endorse PQS workbooks (if designated as a National Verifying Officer) and participate in verification inspections/examinations (for qualification and currency) and qualification boards.

2. Newly Reported Personnel with Existing Certifications

- a. Requirements. Newly reported MIs, PSCOs and Vessel Examiners with existing certifications are required to be certified at their new unit before being authorized to lead vessel inspection / examination activities. A “field practical inspection/examination” under the supervision of a designated VO is required for at least one of the newly reported MI’s certifications. The Inspector Proficiency Assessment Tool (IPAT) will be used to assess the newly reported MI/PSCO. IPAT data shall be entered in accordance with current IPAT processes.
- b. Documentation. Each new member shall have their training records (PQS workbooks, Letters of Certification, certification documents) reviewed and have an interview conducted by the Division Chief. If deferred PQS items are applicable at the new unit, those tasks must be completed and documented in the member’s PQS workbook before certification is granted. Any local Sector-specific PQS tasks should also be completed.

3. Periodic Proficiency Testing

- a. Background. The 2010 Coast Guard Authorization Act 2010 requires an MI to have the training, experience, & qualifications equivalent to a classification society surveyor. A 2011 Industry Training report identified that classification societies periodically determine a surveyor’s proficiency using online testing or biennial meetings. Following certification, proficiency is managed by recency requirements to perform one inspection per year using a specific competency and when inspectors transfer to a new field unit.
- b. Measuring Proficiency: In addition to the Inspector Proficiency Assessment Tool (IPAT), proficiency following certification can be measured in a variety of ways such as requirements for recency, remote computer-based testing, refresher courses, and individual field assessments.

4. Informal Professional Development

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

Units should consider execution of a Professional Development Plan documenting activities that support their pursuit of proficiency. Certain members are required to comply with the Coast Guard Individual Development Plan (IDP), COMDTINST 5357.1 (series). Local formats may be utilized for all others. After completion, certain activities may also be documented on the Record of Professional Development, Form CG-4082.

Activities a Marine Inspector or Vessel Examiner should consider for inclusion in their professional development plan include:

- a. Completion of a CG-Approved maritime training course.
- b. Completion of a pre-planned industry familiarization opportunity
- c. Completion of a marine-related, accredited college course.
- d. Completion of advanced “C” schools (COW/IGS, Wood/RFP, Chemical Tanker Safety, etc.)
- e. Attending a maritime industry event.
- f. Providing instruction OJT during a unit training event.
- g. Providing instruction or a presentation during a CG-led industry day event.
- h. Providing instruction or presentation during an industry-led event.
- i. Conducting an IPAT as an Assessor.
- j. Becoming a VO.

5. Professional Certifications

Professional certifications, such as the ones listed below, are recognized (and sometimes required) within the maritime industry. Earning or working towards professional certifications will enhance a Marine Inspector’s or Vessel Examiner’s knowledge of the maritime industry and directly translated to conducting inspections and examinations.

- a. Merchant Mariner Credential. The Merchant Mariner Credential (MMC) is proof of qualification for mariners serving in specific capacities on varying types of vessels. There are many levels and types of certification as depicted in 46 CFR Part 10 and 46 CFR Part 12. Additional information can be found at: www.uscg.mil/nmc/.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- b. Merchant Mariner Credential Endorsement. Endorsements identify a mariner's qualifications such as an officer capacity (Chief Mate), staff officer (Radio Officer), ratings (Able seaman) or STCW (GMDSS operator). Title 46 CFR Part 10.109 provides a complete list of endorsements. Additional information can be found at: www.uscg.mil/nmc/
- c. National Association of Marine Surveyors. The National Association of Marine Surveyors (NAMS) certifies marine surveyors to a professional standard. There are three levels of membership: Apprentice, Associate and Full Membership/Certification. Additional information can be found at: <http://www.namsglobal.org/>.
- d. Society of Accredited Marine Surveyors. The Society of Accredited Marine Surveyors (SAMS) certifies marine surveyors to a professional standard and also has three classes of membership: Accredited Marine Surveyor (AMS), Surveyor Associate (SA) and Affiliate Member (AFF). Additional information can be found at: <http://www.marinesurvey.org/>
- e. American Welding Society Weld Inspector. The American Welding Society (AWS) focuses on enhancing the science, technology and application of welding and other joining/cutting processes. There are three levels of a welding inspector: Certified Associate Welding Inspector (CAWI), Certified Welding Inspector (CWI) and Senior Certified Welding Inspector (SCWI). Additional information can be found at: <http://www.aws.org/>
- f. ISO Lead Auditor. The International Organization for Standardization (ISO) maintains a number of lead auditor certifications including ISO 9001 (Quality Management Systems), ISO 14001 (Environmental Management Systems), and ISO 27001 (Information Security Management Systems). Additional information on Lead Auditor certification can be found at <http://www.iso.org/>.
- g. International Safety Management (ISM) Lead Auditor. The ISM Code requires companies/vessels subject to IMO standards to establish a safety management system. ISM Lead Auditors receive certification to conduct ISM audits. Additional information regarding the specific ISM Code can be found at <http://www.imo.org/>.
- h. Certified Industrial Hygienist. The American Board of Industrial Hygiene (ABIH) provides a professional certification program which sets standards in industrial hygiene. An Industrial Hygienist focuses on evaluating and improving the work environment in regards to health and safety. Additional information can be found at <http://www.abih.org/>.
- i. Professional Engineer. To become a PE, one must earn a four-year degree in engineering from an accredited engineering program, pass the Fundamentals of Engineering exam, complete four years of engineering experience under a PE and pass the Principles and

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

Practice of Engineering exam. There are several organizations dedicated to the certification of PEs. Additional information can be found at <http://www.sname.org/Home/> or <http://www.nspe.org/index.html> or <http://ncees.org/> or <http://abet.org/>.

F. TRAINING AND PERFORMANCE MEASUREMENT AND CONSISTENCY

1. Mission Management System (MMS)

The MMS is an ISO 9001 based quality management system (QMS) to ensure fulfillment of domestic and international obligations for marine safety and security. A quality management system is the organizational structure, procedures, and resources needed to direct and control an organization in order to continually improve the effectiveness and efficiency of its performance. Information on the MMS may be found in U.S. Coast Guard Mission Management System, COMDTINST 5200.4 (series).

2. Marine Inspector Training Officer (MITO) Peer Audits

- a. Description. The MITO to MITO audit program is a peer-based, second party audit using the principles of ISO 9001:2008 and sponsored by the FORCECOM Mission Management System (MMS) Staff (FC-AEMMS). The audit program improves practices by promoting quality management principles thereby producing internal corrective actions and improving field personnel efficiency. It can be viewed as a subset to the larger MMS audit program.
- b. Process. The audit is a process-based and product-based audit centered on performance support; this means the auditors examine internal processes through document review and interviews with the Unit. An inspector is accompanied by an auditor during an inspection (the inspector being the product) and assessed using the IPAT.
- c. Method. Using sampling, auditors assess the effectiveness of the unit training program as it affects marine inspectors, and examine various aspects of the support climate to identify areas for improvement, capture best practices and assess alignment with policy and guidance. "Sampling" means auditors may vary their concentration and depart from the checklist when necessary to assess conformity to requirements. This is derived from ISO standard 19011:2002, Guidelines for Quality and Environmental Management Systems Auditing, clause 7.4.1. The audit team is made up of a MITO and a Traveling Marine Inspector, both of which are ISO Lead Auditor trained.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

- d. Scope. The scope of the audit is the unit's training and performance support program. Auditors' focus on training but may also touch on other factors that affect training such as safety and resource management. Additionally, inter-departmental and cross-division functionality is examined where units employ marine inspectors for waterways management or investigations duties/tasks.
- e. Results. Audit results, non-conformities and best practices will be shared with other MITOs. Mechanisms for information sharing will include roundtable discussions. A roundtable discussion is a post-audit meeting or conference call to discuss audit findings amongst all MITOs and one guest from the audited command.
- f. Reporting. Audit reports are confidential and only shared amongst the audit team and the command being audited. Copies of audit reports are available from the unit Commander (Sector) or Commanding Officer (Marine Safety Unit) who may include an explanatory cover letter. As needed, HQ, FORCECOM, Areas and Districts may be apprised of audit highlights in a Traveling Marine Inspector Trip Report which acts as a partner document. Traveling Marine Inspector Trip Reports will be stored on the CG-5P-TI CG Portal page.
- g. Frequency. MITO Peer Audits will be conducted at each feeder port approximately once every two years or as directed by Commandant (CG-5P-TI).

3. Inspector Performance Assessment Tool (IPAT)

The IPAT measures proficiency of Marine Inspectors and Examiners. It provides a mechanism to validate, or identify areas for improvement in, our training, management and administrative processes by assessing the proficiency and effectiveness of inspectors while conducting vessel inspections. The data collected provides hard data to provide a foundation for overall assessment of the proficiency of Marine Inspectors and Examiners. The IPAT is designed to be used by seasoned Marine Inspectors who meet or exceed Verifying Officer requirements as specified in the Sector Organization Manual and this Chapter. Strict adherence to the rating scales and definitions as well as the qualification requirements for Assessors is crucial to ensure the integrity of the data collected and to provide a foundation for overall assessment of the marine inspections program. The IPAT is required to be used when a newly reported is being assessed at a new unit as part of the re-certification process after transfer. The IPAT may be used at any other time at the command's discretion.

The IPAT can be found at <https://cgportal2.uscg.mil/communities/ipat/SitePages/Home.aspx>.

G. AWARD FOR EXCELLENCE IN MARINE INSPECTIONS

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**1. Background and Purpose**

In 2013, Commandant (CG-CVC) established the Award for Excellence in Marine Inspections. The award is designed to:

- a. Publicize the importance of marine inspections for the health of the maritime community and the safety of the public;
 - b. Raise the level of awareness of the Marine Inspection program;
 - c. Highlight superior quality inspections conducted by Prevention personnel; and
 - d. Identify processes that enhance safety and improve marine inspections and Port State Control examinations
-

2. Award Administration

- a. Commandant (CG-CVC) will coordinate an administration notification in December of each year soliciting for award nominees. The closing period for submissions should be 31 January of the following year.
- b. Each unit with field level inspectors (Sectors, MSUs, or Activities) may submit one nominee. Nominees should be an individual (not a team), and may be any active duty, civilian or reserve member filling a duty Marine Inspector billet (at the O-4 and below rank or GS-13 and below pay grade) who actively carries out the inspection mission (domestic inspections or Port State Control).
- c. The nominee should exemplify the Core Values and display the traits of an optimal Marine Inspector as described in the Marine Inspector Strategic Needs Assessment of September 2012. Further, the nominee should lead inspection activities that demonstrate superior inspection skills with wide ranging safety improvements, substantial enhancements to the Marine Inspection program, or contributions to a fleet-wide or industry-wide change which improves Marine Safety. Their accomplishments should improve training, safety, expertise and demonstrate professionalism. The award will consider a nominee's body of work over a full calendar year. Activities that result in safety notices, technical publications, or correction of a series of hard to find deficiencies that prevented eventual loss of life are examples of such accomplishments.
- d. Nominations should be made by submitting a one to two page narrative in memo format signed by the unit Commander or Commanding Officer and sent to Commandant (CG-CVC) at cgcvc@uscg.mil. The subject line of the email should state, "Nomination for Excellence in Marine Inspections". The nominee's full name and title shall be listed.

Section A: Marine Inspection Administration**CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY**

The memo should briefly describe the individual's role at the unit, specifically describe the actions for which they are being nominated, and explain how the actions impacted the Coast Guard, industry or safety onboard commercial vessels. If associated with activities in MISLE, the activity numbers should be referenced in the narrative. Additionally, any safety alerts or professional publications associated with the nomination may be attached as supplemental information.

- e. Commandant (CG-CVC) will then convene a board of three to five Marine Inspectors to review submissions and select a winner. The results should be announced via administrative notification no later than 15 March of each year.
- f. In accordance with reference (a), the winner of the award will receive an appropriate trophy, plaque or similar item embossed with the USCG inspections propeller. A flag letter will be sent to the winner as well. Honorable mention nominees will be sent a congratulatory letter from Commandant (CG-CVC).

3. Award Evaluation Criteria

There is no expectation for an award nomination to systematically address each of these criteria. Rather, nominations should highlight specific actions that provide evidence of these items:

- a. Training/Mentoring. Did the nominee actively and skillfully pass along their expertise by training others and helping them to grow in their technical abilities and confidence?
 - (1) What is the success of apprentice / junior inspectors with whom the nominee works?
 - (2) Did the nominee inspire those around them to increase their proficiency?
 - (3) Did the nominee supply the resources, time, tools and training to ensure the success of their fellow inspectors?
 - (4) Did the nominee enhance the inspections knowledge of all personnel including leadership?
 - (5) How effectively did the nominee share inspections knowledge with others (i.e., not keeping it all to themselves)?
 - (6) Did the nominee reach out to industry/ other groups to present inspection issues and further enhance their knowledge?
- b. Impact on increasing safety. Did the action of the nominee lead to fixing chronic problems with a demonstrable impact on safety of shipping, result in safety alerts, or

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

greatly enhance the Marine Safety Program? Did their actions lead to needed safety changes or build a strong case for change?

- (1) Did an action of the nominee result in preventing a mishap or casualty?
 - (2) How well did the nominee foster a culture of safety and ISM compliance?
 - (3) Did the nominee ensure that Coast Guard personnel were properly equipped to safely perform their inspections?
 - (4) Did they identify an issue which led to a change of operations in industry or to a particular fleet of vessels?
 - (5) Did the nominee conduct safety outreach to industry/vessel owners?
- c. Display of expertise. Was the level of knowledge displayed by the nominee beyond the normal level for someone in a similar position?
- (1) Did the nominee clearly distinguish themselves as a subject matter expert that understands and properly applies regulations, policies and technical information (the nomination should provide specific examples)?
 - (2) Has the nominee been asked to speak at a conference, workshop, training evolution, and/ or at other units?
 - (3) If the nominee had not taken their actions, would a hazard go unnoticed or would a process be not as effective?
 - (4) Did the inspector bring to light a regulatory or policy conflict, material condition or safety concern that had previously gone unnoticed?
- d. Professionalism. How well did the nominee work with industry and their peers to improve Coast Guard/ Industry partnerships?
- (1) Did they conduct themselves in proper manner, exemplifying the Core Values of honor, respect, and devotion to duty (uniform appearance, speaking/ listening and treatment of others)?
 - (2) Is the nominee recognized as a leader in the marine inspection community and committed to the Coast Guard's Marine Safety mission?
 - (3) Did the nominee lead and encourage the use of teams to solve complex issues?

Section A: Marine Inspection Administration

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

- (4) Did the nominee make balanced decisions with consideration of how they affect commerce, public safety and environmental risk?

- (5) Was the nominee tactful and poised even when dealing with a contentious situation?

USCG Marine Safety Manual, Vol. II: Materiel Inspection

CHAPTER 7: COMMERCIAL VESSEL COMPLIANCE PERSONNEL PROFICIENCY

Verification Examination Form

Name: _____ Vessel: _____ Inspection Type: _____
 Qualification: _____ Date: _____ Exam Number: _____ of _____

Communication Skills	Yes	No
Did the apprentice clearly articulate the inspection protocols and procedures?		
Did the apprentice provide an accurate and timely drill evaluation critique?		
Were the deficiencies and their corresponding regulations thoroughly explained?		
Did the vessel owner understand apprentices' expectations and vessel limitations?		
Did the apprentice provide the necessary documentation and information in MISLE?		

Knowledge	Yes	No
Did the apprentice gather the necessary information prior to the inspection?		
Did the apprentice demonstrate an adequate working knowledge of vessel systems?		
Were all deficiencies issued by the apprentice supported by regulation?		
Did the apprentice issue the proper documentation and certificates?		
Did the apprentice use applicable references?		

Ability	Yes	No
Did the apprentice systemically conduct an inspection?		
Was the inspection thorough in accordance with the applicable job aid?		
Was the inspection conducted in a reasonable amount of time?		
Did the apprentice utilize inspection personnel appropriately to complete the inspection?		

Judgment	Yes	No
Did the apprentice make sound decisions and apply the proper enforcement action for the deficiencies?		
Did apprentice ensure all team members were adequately equipped with PPE?		
Was the apprentice able to evaluate and apply equivalencies, actual or hypothetical?		

Maturity	Yes	No
Did the apprentice act in a professional manner even during conflict?		
Did the apprentice bring all necessary references, equipment, and materials?		
Did the apprentice act ethically and without discrimination?		
Did the apprentice bring credit to the CG through actions, demeanor, and appearance?

APPENDIX 1

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION****A. INTRODUCTION**

This chapter of the Marine Safety Manual (MSM) provides guidance regarding inspections for the issuance of a Certificate of Inspection (COI), as well as information concerning various decisions and interpretations of regulations. This guidance is supplemented by references to other sections of the MSM, which have additional information. The responsibilities of the Officer in Charge, Marine Inspection (OCMI) and inspection personnel are discussed in the MSM, Volume I, Administration and Management, COMDTINST M16000.6 (series).

B. CERTIFICATION OF VESSELS

1. General Provisions

46 U.S.C. Chapter 33 requires that certain vessels possess a COI. The issuance of a COI depends on the vessel's satisfactory completion of an inspection for certification. A vessel's retention of the COI depends on the continued maintenance of the vessel in a safe operating condition. When satisfied that the vessel in question complies with all applicable statutes and regulations and can be operated safely without endangering life or property, the OCMI is authorized to issue a Permanent COI or a Temporary COI, Form CG-854, pending issuance of the permanent COI. Both permanent and temporary COIs are generated by the Marine Information for Safety and Law Enforcement (MISLE) database.

NOTE: The initial COI may be completed before issuance of the Certification of Document (COD). The COI should be issued, provided the National Vessel Documentation Center (NVCD) has received the application for documentation.

Contact the NVCD about vessel documentation questions.

- a. Government owned vessels. Government owned vessels may be subject to maritime and environmental safety laws. To determine if a regulation applies to government vessels, one should check the applicability sections of the applicable CFR subchapter.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- b. Jones Act requirements for coastwise U.S. trade. Vessels engaged in coastwise or Great Lakes trade must be U.S.-built vessels. For a vessel to be considered a U.S.-built vessel, it must have been constructed totally within the United States. This includes fabricated structural vessel components; there is no allowance for fabrication of even a small portion of major components outside of the United States.

NOTE: Construction materials that are otherwise processed per detailed instructions so as to permit simplified assembly with nominal preparation will normally be considered fabricated.

2. Periods of Validity

- a. Introduction. The periods of validity for a COI vary by vessel type and are specified within the applicable regulations. In general, they are as follows:
- (1) 1 year for passenger vessels on all routes, small passenger vessels that engage on international voyages, Nautical School Ships, and nuclear powered vessels.
 - (2) 5 years for cargo, tank, oceanographic research, small passenger vessels engaged exclusively on domestic voyages, and miscellaneous vessels.
- b. COIs are normally issued for the maximum period specified in the applicable regulations. A vessel is certificated on its ability to meet the minimum safety standards set forth in the regulations. Under existing law, any vessel that meets these standards is entitled to a full-term COI.
- c. A vessel that is unable to meet the minimum standards must correct its deficiencies prior to certification or, if the deficiencies are minor and do not make operation of the vessel unsafe, be granted reasonable time in which to make the necessary corrections.
- d. An owner may surrender the COI and apply for inspection for recertification at any time prior to the expiration date.
- e. The conditions under which certain vessels on foreign voyages may return to the United States with expired certificates are discussed in Paragraph C.7 of this chapter.
- f. Vessels with expired COIs. A vessel with a COI that has lapsed, regardless of circumstances or reasons, may be required to undergo inspection for certification as a new vessel if the owner/operator desires to place the vessel back into certificated service.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (1) The cognizant OCMI will make a determination as to the type and extent of inspection requirements appropriate after giving due consideration to the circumstances behind the vessel's out-of-service period.
 - (2) When making this the determination, the OCMI must closely evaluate environmental conditions such as operations in fresh water, salt water, or drydock lay-up as well as any structural modifications made to the vessel.
- g. Grandfathering. The OCMI may, at his or her discretion, require a formerly certificated vessel to be inspected as a new vessel regardless of its former status as a certificated vessel. Such vessels would no longer be afforded exemption from regulatory requirements under grandfather provisions provided by law, regulation, or policy.
- h. A vessel that was once certificated does not qualify indefinitely as an "existing" vessel, especially when it has been structurally modified and/or out of service for an extended period. A vessel whose COI has lapsed will be required to meet those inspection for certification requirements determined to be appropriate by the issuing authority—the OCMI.
- i. 1-year certificates. Regulations permit the issuance of certificates to certain cargo, tank, and miscellaneous vessels for periods of less than 2 years. Examples are 1-year certificates for--
- (1) Vessels equipped with firetube main propulsion boilers, including riveted lap seam boilers;
 - (2) Vessels that, in the OCMI's opinion, should be inspected on a 1-year basis by reason of route (the Commandant's approval must be obtained in these cases); and
 - (3) Nuclear powered vessels.

3. Entries on COIs

- a. Number of passengers stated. Except for ferryboats, the OCMI is responsible for determining the number of passengers that a vessel has accommodations for and can carry with prudence and safety, as provided for in 46 U.S.C. 3501. That number must be stated on the COI. The OCMI must not permit the number of passengers allowed to exceed that permitted by law or regulation, or specified in the vessel's stability letter.
- b. Maximum number of passengers on ferry vessels. See 46 U.S.C. 3501 Notes of Decisions, for guidance on how to compute and list the number of passengers and crew on the COI for ferry vessels. 46 U.S.C. 3501 notes that "...respecting the number of passengers that may lawfully be carried by a passenger steamer,

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

[46 U.S.C. 3502] have no application to a ferryboat, though temporarily employed as an excursion boat.”

- (1) Essentially, 46 U.S.C. 3501 considers ferry vessels to be cargo vessels, not passenger vessels. Accordingly, the number of passengers and crew authorized on a ferry vessel is not required to be listed on the COI.
 - (2) However, many ferry vessels are a combination of both cargo and passenger vessels. As such, when the OCMI and the owner of a ferry vessel agree on the number of passengers that can be carried safely, and when the owner of the ferry desires it, the maximum number of passengers permitted may be entered on the COI.
- c. Tankships carrying grain cargo. No COI amendment is necessary for a tankship to carry grain cargo. The Federal Grain Inspection Service provides inspectors to oversee loading of vessels with grain.

NOTE: When stability is a factor in limiting the maximum number of persons that can be carried with safety on any ferry vessel, the total number of persons permitted aboard must be stated in the stability letter.

4. Temporary COIs

A Temporary COI, Form CG-854, provides evidence of the satisfactory completion of an inspection for certification (see 46 U.S.C. 3309). It stands in lieu of a COI and, until replaced by a COI, has all the force and effect of the permanent certificate. The temporary certificate is intended for use when the immediate issuance of a COI is not possible at the completion of an inspection. It is not the Commandant's intention that a COI should be withheld pending correction of minor deficiencies after a temporary certificate has been issued. Further, when the permanent COI can be issued in time to meet the vessel's needs, a temporary certificate should not be issued.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

5. Seasonal Restrictions

Seasonal limitations are intended to ensure the overall seaworthiness of the vessel and the safety of the passengers carried under differing operational conditions, without completely halting the operation of the vessel during any specific period of time. COI statements of seasonal restrictions must be as descriptive as possible, showing limitations on vessel routes, the scope of passengers carrying authorizations, and the like.

6. Certificates Expiring at Sea

- a. COI extensions. There are no statutory provisions that allow for the extension of a COI. Accordingly, requests for extensions of certificates must be denied.
 - b. Expirations of COIs during foreign voyages. Under 46 U.S.C. 3314, a vessel may complete a foreign voyage to a port of the United States within 30 days of the expiration of its COI without incurring penalties for operating without a valid certificate.
 - (1) The vessel owner/operator must apply for an inspection for certification at the first U.S. port of call.
 - (2) The vessel must then complete an inspection for certification, and a new COI or a Permit to Proceed will be issued, if an inspection for certification has been conducted to the point that the OCMI considers the vessel safe to proceed on the voyage. (See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter A6 for more details.)
 - c. Vessels sailing less than 15 days prior to expiration of COI. 46 U.S.C. 3314 prevents the grace period described above from being applied if the COI would expire within 15 days of the date of sailing from a U.S. port. A vessel would not violate this provision merely by sailing to a foreign port within 15 days of the expiration of the COI, provided it returns to a U.S. port before the COI expires. Such a vessel would be in violation if it sailed within 15 days of the expiration date and failed to return before expiration of the COI.
-

7. Marking of Hailing Ports

Under 46 CFR 67.123, a hailing port must be marked on some clearly visible exterior part of the stern of a documented vessel. The markings must be durable and made in clearly legible letters of the Latin alphabet or Arabic or Roman numerals of no less than 4 inches in height.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

8. Towing of Vessels Permanently Laid-Up, Dismantled, or Out-of-Commission

a. Vessels are frequently towed for purposes of permanent removal from navigation or scrapping as these vessels reach the end of their useful lives. It has been generally determined that such vessels making a one-way voyage under tow; without crew, cargo, or passengers; and not holding documents as a merchant vessel, are not subject to inspection and certification requirements. Such vessels are "laid up, dismantled, or out of commission" under 46 U.S.C. 3302(e) and 46 CFR 90.05-1(a)(3). In accordance with this determination, when the OCMI is satisfied by documentary evidence or other means that certain conditions are met, such vessels do not require a COI. These conditions may include some or all of the following:

- (1) The vessel is not currently documented by the Coast Guard.
- (2) The vessel will carry no passengers or cargo.
- (3) The vessel will be towed and unmanned.
- (4) The vessel is making a one-way voyage for purposes of scrapping or permanent removal from navigation.
- (5) The vessel is not intended to be used in commerce during the voyage.
- (6) The vessel will pose no threat to life, property, or the environment while in U.S. waters.

NOTE: Such vessels require a Load Line Exemption Certificate. See MSM Volume IV, Technical, COMDTINST M16000.9 (series), Chapter 6 for guidance.

- b. U.S. Customs and Border Protection has determined that, although such vessels require clearance before being towed to a foreign port, verification by the OCMI to the effect that "[name of vessel], being towed on a one-way voyage for purposes of scrapping, etc., is not required to hold a COI" will suffice for clearance purposes should appear on the loadline exemption certificate.
- c. Carriage of scrap. Scrap metal carried for ballast in such vessels will not be classed as cargo as long as the amount, location, and method of stowage of scrap is acceptable to the OCMI and does not exceed the tonnage of liquid ballast that would normally be employed. This is so that such vessels may meet the requirements given above. When the matter of what constitutes cargo is at issue, Commandant (CG-CVC) should be consulted.
- d. Requirements for passage through the St. Lawrence Seaway. Vessels subject to the Load Line Acts 46 U.S.C. 5102 and transiting under their own power to a non-U.S. port for decommissioning require load line certificates, COIs, and all other applicable statutory certificates before leaving a U.S. port.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (1) This policy is not intended to contravene or supersede requirements of the Canadian government with respect to passage through Canadian waters and clearance from Canadian ports. Owners of vessels transiting under their own power for decommissioning should contact the Director, Marine Regulations Branch, Department of Transport, Ottawa, Ontario, Canada, for further information in this regard.
- (2) Owners of such vessels intending to transit the waters of other countries should contact officials of those countries. The issuance of an International Load Line Exemption Certificate, by the local OCMI may be necessary. For further information and guidance, see MSM Volume IV, Technical, COMDINST M16000.9 (series), Chapter 6, and for applicable regulations, see 46 CFR 42.03-30(b)(3).

9. Vessels Operating in South-Eastern Alaska

46 CFR 2.01-80 states that the waters of southeastern Alaska inside of the general trend of the shore from Cape Spencer, southeasterly to Cape Muzon, and thence easterly to Sitklan Island, must be considered "lakes, bays, and sounds other than the Great Lakes" for administration of the vessel inspection laws and regulations. The waters between southeastern Alaska and Prince Rupert, BC, via Chatham Sound likewise have been classed "lakes, bays, and sounds" for purposes of vessel inspection. The "Inside Passage" between southeastern Alaska and Puget Sound is considered "lakes, bays, and sounds" for inspection and licensing purposes only if certain conditions are met. Approval by Commandant (CG-CVC) is required for vessels to operate between southeastern Alaska and the state of Washington under these considerations.

10. Dual Certification for Passenger-Carrying Vessels and Sailing School Vessels

Under existing regulations, a qualifying vessel may be operated in service part-time as a sailing school vessel (46 CFR Subchapter R) and at other times as a passenger-carrying vessel (46 CFR Subchapter T or H). 46 CFR 169.103(b)(5) states that the sailing school regulations are not applicable when a vessel is operating under the authority of a current valid COI as a passenger vessel. This regulation was written specifically to clarify the dual service situation. Although the regulations allow for dual certification, the OCMI may be reluctant to issue a certificate, let alone two, without conducting an inspection each time the operator physically alters the vessel as it shifts from one service to the other. General practice is to issue only one certificate at a time for the appropriate service, thus creating both an administrative and an inspection burden each time the vessel changes service. Alternatively, the OCMI may issue a single COI, under the conditions addressed below, to cover both services.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- a. Single COI for predominant service. OCMI may issue a single COI for the vessel's predominate service with an endorsement for the alternative service.
- (1) Before issuing such a COI, the OCMI should be reasonably satisfied that the vessel is constructed, maintained, and outfitted in compliance with the applicable regulations regardless of which service the vessel is in at any given time. This requires the vessel to meet the more stringent requirements between 46 CFR Part 169 and either 46 CFR Subchapter H or T at all times.
 - (2) This procedure should enable the OCMI to avoid some degree of inspection each time the vessel shifts from one service to the other. With the vessel's material condition and outfitting fixed, operating conditions, manning, and possible total persons allowed may vary depending upon the applicable regulations within Subchapters H or T and can be addressed accordingly in the endorsement for the alternative service.
 - (3) In cases where the OCMI finds it appropriate and practicable to permit outfitting to vary, such variance should also be addressed in the endorsement.
- b. Period of validity. A vessel owner or operator must accept the application and maintenance of the more stringent regulations as a requisite to obtaining the benefits of a single COI, as opposed to trading COIs every time the vessel changes service and submitting to inspection as deemed necessary by the OCMI. Therefore, regardless of the predominate service under which the vessel's COI is issued, the vessel must be certificated for a period that is consistent with the more stringent regulations, whether they are for the predominate service for which the certificate is issued or the lesser service for which the endorsement is added. The intervals for inspections and drydock and tailshaft exams must also be based upon the more stringent regulations.

11. Inspection of U.S. Vessels in Foreign Countries

The following offices have responsibility for the listed foreign marine inspection regions:

- a. Sector Puget Sound: western coast of Canada.
- b. Sector San Diego: western coast of Mexico north of latitude 20 North.
- c. Sector New Orleans: South and Central America, the western coast of Mexico south of latitude 20 North, and all of the eastern coast of Mexico.
- d. Sector Boston: eastern coast of Canada.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- e. **Sector Miami:** Bahamas
- f. **Sector San Juan:** Carribean
- g. **Sector Honolulu:** Pacific Islands
- h. **Sector Guam:** Pacific Islands
- i. **Far East Activities:** Asia and Diego Garcia.
- j. **Activities Europe:** Europe, the Mediterranean Sea, the Red Sea, the Persian Gulf, the Arabian Sea, and all of Africa.

NOTE: For areas in question or new construction projects, contact Commandant (CG-CVC).

12. Overseas Inspection Fees

Payment of user fees and overseas inspection expenses(46 CFR 2.10-120. An overseas fee will be charged each time a set of travel orders are issued for an inspector to inspect a vessel overseas. Even if subsequent trips are for the same activity, an additional user fee will be charged prior to conducting the inspection/exam.

Policy Exception:Local Inspection - For overseas inspections performed within a reasonable travel distance, an overseas inspection fee will be charged ONCE for an inspection activity which provides CG credit (i.e. COI, annual, hull, certificates issued etc.) regardless of the number of visits. If no credit or certificate is requested (IE non-targeted ACP DD), no overseas inspection fee will be accessed.

- a. **New Construction – An overseas inspection fee shall only be assessed ONCE for any new construction or conversion project that requires multiple visits.**
- b. **Deficiency checks/damage survey - If a TONO is issued for an inspector for sole purpose of clearing a deficiency or conducting a damage survey, then an overseas inspection fee will be assessed. If inspectors are already in the local area, an overseas inspection fee will not be assessed.**

Policy continues on B1-9.

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

13. Certification of Vessels Undergoing a Reflag and/or Major Conversion

- a. NVIC 10-81, CH-1, was developed to allow certain categories of existing foreign-flag vessels to be brought under the U.S. flag in a manner consistent with the principles and levels of safety in current Coast Guard regulations or, in some cases, to Coast Guard standards in effect at the time of the vessel's construction.
 - (1) The NVIC makes reference to acceptance of vessels between 2 and 10 years old for reflag and conversion. Older vessels will not be precluded if they can meet the SOLAS Method I-C Structural Fire Protection Requirements, as amended in 1981, in addition to all other requirements prescribed in NVIC 10-81 CH-1.
 - (2) In addition, this NVIC can be used as a guideline for existing vessels that undergo a major conversion, are brought under Coast Guard inspection, or wrecked vessels that are able to register under 46 U.S.C. 12107.
- b. Major conversion determinations. Determinations of major conversions are made by Commandant (CG-CVC). It is important that vessel owners contemplating work that may constitute a major conversion contact Commandant (CG-CVC) as soon as they have a general concept of the work to be performed so it can be reviewed. The Coast Guard bases major conversion determinations on 46 U.S.C. 2101(14a). This defines major conversion as a conversion that--
 - (1) Substantially changes the dimensions or carrying capacity of the vessel;
 - (2) Changes the type of the vessel;
 - (3) Substantially prolongs the life of the vessel; or
 - (4) Otherwise changes the vessel so that it is essentially a new vessel.
- c. Special provisions for the reflag of vessels participating in the Maritime Security Program (MSP):

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (1) **Background.** **The Maritime Security Act of 1996 became law as an amendment to Title VI of the Merchant Marine Act of 1936. The Maritime Security Act of 2003 superseded the 1996 Maritime Security Act and reauthorized the Maritime Security Program under 46 U.S.C.A. 53102.** The Maritime Security Program (MSP) is administered by the U.S. Maritime Administration (MARAD) Office of Sealift Support (MAR-630) and establishes a program for direct U.S. government payment to private vessel owners for the right to use designated U.S. flag vessels to carry military cargo in time of war, national emergency, or military contingency.
 - (a) These privately owned and operated commercial vessels will normally be employed in commercial operations unless called upon by MARAD for military operations. Foreign flag vessels may apply for MSP but must reflag to U.S. flag as a condition of participation.
 - (b) MSP vessels are not (and will not become, even upon activation) public vessels as defined by 46 U.S.C. 2101 (24). MSP vessels must be U.S.-documented vessels, subject to inspection and certification by the Coast Guard.
 - (c) Separate legislation in the Coast Guard Authorization Act of 1996 (PL 104-324) provides that reflagged MSP vessels only need to comply with ABS class rules (or the rules of another class society accepted by the Coast Guard) and international convention requirements if the vessel meets the eligibility conditions discussed in the following paragraphs.
- (2) **Eligibility conditions for reflag under MSP.** The Coast Guard may accept previously conducted class society surveys and previously issued international certificates in lieu of establishing equivalency to U.S. regulations for all vessel equipment and systems, provided that--
 - (a) The vessel is classed by and designed in accordance with the rules of the ABS or another classification society accepted by the Coast Guard;
 - (b) The vessel complies with applicable international agreements and associated guidelines, as determined by the country in which the vessel was documented immediately before becoming a U.S. documented vessel; and
 - (c) That the country under which the vessel is currently flagged has not been identified by the Coast Guard as inadequately enforcing international vessel regulations on the vessel making application for certification.
- (3) **For MSP and application for inspection.** In order to carry out the conditions described in the paragraph above, the following procedure must be followed to issue the initial COI and international certificates for a foreign vessel entering MSP.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (a) MARAD Headquarters (MAR-630) will notify Commandant (CG-CVC) when a foreign flag vessel is being considered for selection for participation in MSP. CG-CVC will conduct a review of the vessel's Port State Control boarding history in MISLE and notify MARAD of any significant instances of past non-compliance with international regulations. MARAD will notify CG-CVC and the vessel owner if the vessel has been selected for MSP participation.
- (b) The vessel owner will apply for inspection to the OCMI in whose zone the reflag inspection will be conducted. If that location is not known at the time of acceptance into MSP (to facilitate timely plan review) the owner may make application to Commandant (CG-CVC) who will hold the application for forwarding to the cognizant OCMI when an inspection location has been selected. CG-CVC will provide a copy of the application to Commanding Officer, Marine Safety Center (MSC).
- (4) Plan review to verify SOLAS compliance for MSP. The vessel owner must submit the items below to the Commanding Officer, MSC for review to verify compliance with SOLAS, MARPOL, ICLL, and that the vessel is designed in accordance with the rules of the ABS or other accepted class society.
 - (a) When the vessel has been classed and designed in accordance with rules other than ABS, the MSC must determine acceptance on a case-by-case basis for the purpose of MSP participation only. This acceptance of class rules and design for MSP must not be construed as acceptance for any other inspection program.
 - (b) The vessel's owner, flag administration, and class society must identify all areas where previous equivalence or exception has been granted to SOLAS, MARPOL, ICLL, the design rules of the ABS, or other accepted class rules.
 - (c) Plans to be submitted. The following plans must be submitted:

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- [1] General arrangement plans.
 - [2] Structural fire protection division rating plans (assuming Method I construction, MSC will spot check fire boundary ratings and ventilation details, i.e., penetrations by the ventilation system of fire rated divisions).
 - [3] Fire detection system plans (to verify placement and overall system design).
 - [4] Fixed fire extinguishing system plans (a minimum 20 second time delay for releases into manned spaces must be required even though this is not specified in SOLAS).
 - [5] Automation system plans including a qualitative failure analysis for vital systems, or a letter from the class society stating that the systems are designed to meet the failsafe requirements of SOLAS.
- (d) Plans to be submitted for verification of class approval. The following information/plans and class society approval letters must also be submitted, but generally will be examined only to verify the approval action of the class society and will not undergo MSC design review or OCMI inspection unless problems or unusual items are noted:
- [1] Trim and stability booklets, including lightship properties and stability test data.
 - [2] Letter from the flag administration or class society indicating the vessel meets probabilistic damage stability requirements for vessels built after 1 February 1992.
 - [3] Letter from flag administration or class society indicating review/approval of the following items, with notes about all areas that require special attention/inspection, such as--
 - aa. Structures;
 - bb. Fire main systems;
 - cc. Bilge systems; and
 - dd. Steering gear and steering gear alarm systems.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION****(5) OCMI inspection for initial certification.****(a) Issuance of the initial COI is subject to the following:**

[1] A satisfactory onboard inspection by the cognizant OCMI, conducted with a surveyor from the vessel's class society or flag administration who can explain interpretations of SOLAS, MARPOL, and the International Convention on Load Lines.

[2] The owner must provide the OCMI with access to the last annual survey report of the class society, the list of outstanding class recommendations and statutory requirements, and the latest drydock survey report (including latest gaugings).

[3] A list of all systems, equipment or other items that meet a standard different from the U.S. statutory requirements for a vessel of that size and service. (e.g. pressure vessels that are not ASME stamped or lifejackets that are not Coast Guard approved).

aa. This list is consistent with Coast Guard reflag policy of the past which has shown that the ability to rapidly identify these items greatly speeds the initial reflag inspection.

bb. The list will allow inspectors to identify and document items in the vessel's inspection record that meet international, class or previous flag administration interpretations of standards. This is necessary to avoid duplication of this effort at subsequent inspections. It will also eliminate the need for the owner to continue providing a representative of previous flag administration at subsequent inspections.

(b) Conduct of the inspection. The initial inspection must be sufficiently detailed to verify full compliance with international regulations. The procedures applicable to foreign vessel port state control annual examinations described in MSM Volume II, Material Inspection, M16000.7 (series) Chapter D1 must be used as a guideline for the scope of the initial inspection.

[1] The inspector must consult the class society/flag administration representative in attendance when the inspector requires guidance as to the application of a particular international regulation. If the class society/flag administration representative in attendance verifies that the item in question is satisfactory under their guidelines, the OCMI will accept it. At the conclusion of the inspection, the inspector must make a special note in MISLE documenting all items on the vessel that are found to be acceptable to the class society/flag administration representative, but that

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

are treated differently under current Coast Guard policy. (NVIC 10-81, CH-1, provides a useful summary of Coast Guard requirements to use as a comparison to international requirements.)

- [2] Satisfactory fire and abandon ship drills must be performed in the presence of the Coast Guard marine inspector. The drills must be conducted by the vessel's U.S. crew prior to issuance of the initial COI.
- [3] In addition to the inspection described in MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter D1, the inspector may verify that all current structures, equipment or systems on the vessel are in agreement with the plans reviewed by the MSC or approved by the class society and/or flag administration. The scope of the plan's verification is at the OCMI's discretion, but should generally be conducted as a spot check.
- (c) Engine automation test. If the vessel requests reduced manning as a result of engine automation then the automation test procedure and approval must be in accordance with U.S. regulations and vessel inspection policy (e.g. NVIC 1-69, NVIC 6-84 and NVIC 10-81, CH-1). The MSC will review the test procedure (see C of this chapter). The final manning requirements must be established based on satisfactory verification of the engine automation, as outlined in NVIC 1-69.
- (d) Deficiencies. Any area considered deficient as a result of the Coast Guard examination described in MSM Volume II, Material Inspection, M16000.7 (series), Chapter D1 (annual examination) must be subjected to an expanded examination based on the principle of "clear grounds" as defined in that chapter.
- (e) Drydocking/internal structural examination. A separate drydock examination and comprehensive internal structural examination (including entry and examination of ballast tanks and double bottoms) is only required in conjunction with the initial COI if clear grounds exist to require it. The drydock date should be consistent with the previously established dates set by the flag administration and/or class society. If the credit drydock and/or internal examination coincides with the initial COI, the inspector must conduct the examinations in accordance with the guidelines established by the previous flag administration and/or class society.
- (f) Pollution prevention. The vessel must comply with all U.S. regulations and international pollution prevention requirements that would be applicable to a foreign vessel calling in a U.S. port.
- (g) Issuance of certificates upon satisfactory initial examination:

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- [1] COI. Upon satisfactory completion of the initial inspection, the vessel will be issued a COI for the route and service specified on its existing statutory certificates. A reduction in manning due to engine automation must be approved and tested as satisfactory in accordance with U.S. regulations and policy for reflags conducted under NVIC 10-81 (CH-1). The OCMI must place the following endorsement on the COI and as a special note in MISLE:

“This vessel is certificated under the provisions of the Maritime Security Program (MSP) and is inspected and certificated solely in accordance with the requirements of class rules and international convention requirements as applicable. This vessel was issued its initial certificate of inspection in accordance with the MSP on DD MM YY.” (Insert date inspection is complete.)

- [2] International convention certificates. SOLAS, MARPOL, and ICLL certificates will be issued by the Coast Guard or by a Recognized Organization that is authorized to issue the certificate on behalf of the Coast Guard. This includes authorization granted under existing agreements, new agreements under 46 CFR Part 8, or the Alternate Compliance Program (ACP).
- [3] OCMI must document any areas where the previous flag administration or class society accepted a system or equipment that differs either from the Coast Guard's statutory requirements or Coast Guard enforcement of international regulations. OCMI must also note such occurrences as a special note in MISLE.
- (h) OCMI action if initial inspection is unsatisfactory. If the Coast Guard's initial inspection yields sufficient evidence to show that the country under which the vessel is currently flagged has been inadequately enforcing international vessel regulations on the vessel applying for certification, the COI must be withheld and Commandant (CG-CVC) notified.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- [1] Commandant (CG-CVC) will notify MARAD that the vessel is not currently acceptable to receive a COI. Commandant and MARAD will then consult as to whether the vessel should be allowed to make repairs or modifications in order to complete certification for entry into MSP, or whether the vessel should be excluded from MSP participation.
- [2] OCMI's are strongly encouraged to call upon the assistance of the traveling inspectors at Commandant (CG-54-TI) when the initial inspection of an MSP vessel indicates clear grounds for an expanded examination.
- [3] Payment of user fees and overseas inspections expenses. User fees must be paid prior to the initial inspection for certification. Travel and per diem costs for overseas inspections must be paid in advance on a cost estimated basis. If owners cannot arrange for advance payment of user fees or travel costs (overseas only) due to scheduling difficulties, then Commandant (CG-CVC) must be contacted to determine if a delay in payment will be permitted until after the inspection has commenced.
- (6) Inspection of MSP vessels subsequent to initial inspection. MSP vessels will continue to be inspected under the preceding guidelines for all subsequent inspections except as noted below.
- (a) Intervals for subsequent inspection must be in accordance with international convention certificate requirements.
- (b) Vessels accepted under MSP reflag must be reissued a COI every 5 years upon application from the owner if the vessel has completed all scheduled inspections for the maintenance of class and international convention certificates (including all annual endorsements, surveys and drydockings).
- (c) OCMI's must continue to conduct inspections in accordance with the class rules, SOLAS, MARPOL, and ICLL. Situations when the previous flag administration or class society accepted a system or equipment prior to reflag which differs from the Coast Guard's current statutory or policy interpretation for the implementation for that international regulation (at the time of the initial inspection) should have been recorded as a special note in MISLE at the initial inspection. New installations or modifications to existing systems made subsequently to the initial reflag must conform to the Coast Guard's interpretation of international regulations at the time of the modification, so far as reasonable and practical.
- (d) MSP vessels that elect to enroll in the ACP may employ ACP inspection procedures subsequent to the initial reflag inspection, which will be conducted by the Coast Guard.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (e) User fees must be paid in a manner consistent with all U.S. certificated vessels.

13. Vessels of Novel Design

- a. Proposed operation. From time to time, an OCMI will be approached with some novel operation proposal that is not covered by any regulation. In such cases, the OCMI will coordinate the proposed operation and associated inspection requirements through the District Commander (p) to Commandant (CG-CVC).
- b. Regulatory requirements. Commandant (CG-CVC) will consult with the cognizant OCMI to determine the level of regulation that will be applied to vessels in “novel” operations not covered by any or part of regulations.

C. PRE-INSPECTION PROCEDURES

1. Application for Inspection of U.S. Vessel, Form CG-3752

Applications for inspection for certification must be submitted to the cognizant OCMI by the vessel’s master, owner, or agent on Application for Inspection of US Vessel, Form CG-3752 (see 46 CFR 2.01-1). The application for initial inspection of a vessel being newly constructed or converted must be submitted prior to the start of such construction or conversion. This must be followed by the submittal of plans and specifications required by the applicable regulations.

In the event of an office receiving an application for construction/conversion of a vessel that is not under that office’s jurisdiction, the application should be forwarded to the appropriate OCMI and the applicant so advised. Inspection for certification must not commence until a proper application has been submitted by a U.S. citizen and the proposed operation of the vessel (use, route, passengers, etc.) is known to the OCMI and the inspector.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION****2. Preparation by the Inspector**

The marine inspector must be as well informed as possible of the vessel's proposed operation (and its past history, as applicable) before commencing the inspection. Due to the many differing circumstances encountered, the availability of such information will vary.

Generally, the following procedures should be used:

- a. Prior to conducting any inspection service that is related to the compliance of its COI, marine inspectors shall ensure the appropriate Application for Inspection form (CG-3752) is properly filed and verify that the required annual vessel inspection user fee has been paid. 46 CFR 2.10 establishes inspection and examination fees for all vessels required to have a COI. User fee invoices are automatically generated for vessels with valid COIs. Additional fees are also required for inspections and examinations conducted at overseas locations.
- b. Before beginning the inspection, the inspector should review the vessel's previous inspection records. For initial inspection, the inspector should also review copies of all approved plans, specifications, and relevant correspondence, and any record of outstanding deficiencies.
- c. When the owner, agent, or master of a vessel previously inspected in another zone applies for inspection, the OCMI should obtain the inspection records for the previous inspection for certification and drydocking examination from the certifying OCMI. Such records should be returned after the inspection is completed, unless the vessel has permanently changed its principal port of operation to the zone where inspected. See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter A2 for more information.

D. CONDUCTING INSPECTIONS FOR CERTIFICATION

1. Initial Inspections

- a. Definition. The initial inspection for certification is the first inspection held on a vessel during or after construction or conversion. It is a prerequisite to the issuance of the original COI.
- b. Purpose. At the initial inspection, the inspector ascertains that the vessel has been built (or converted) and equipped in accordance with the applicable regulations, construction standards, and approved plans and specifications, and that its condition is such that it can be operated with safety of life and property in the service and route(s) specified. The inspector also ensures that the condition and installation of all equipment and associated apparatuses comply with applicable regulations.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (1) The initial inspection should be carried out with special attention to detail.
 - (2) All unusual circumstances that require interpretations of regulations, special considerations, the use of substitutions or equivalents, etc., must be carefully considered and the decisions well documented in the MSLE activity narrative and/or inspection notes.
- c. Policies concerning ABS-classed vessels. NVIC 10-82 clearly establishes guidelines for the acceptance of ABS plan review and inspection during the initial inspection. This NVIC delineates areas of shared reviews and inspections and areas retained solely by the Coast Guard. Most ABS-classed vessels will fall under NVIC 10-82.
- (1) An example of shared review and inspection is an Inert Gas System (IGS) or Crude Oil Washing (COW) system installed in a vessel for which the owner has requested ABS review and inspection. In this situation, the Coast Guard would accept ABS approval and inspection if ABS provides a letter certifying that the systems are in compliance with regulatory requirements.
 - (2) When the provisions of NVIC 10-82 are not followed, ABS will perform plan review and inspection for class only, and will not review or inspect for regulatory requirements. In these cases, the Coast Guard will complete the plan review and inspection requirements.
 - (3) NVIC 10-82 also applies to major conversions. Questions concerning the applicability of NVIC 10-82 must be referred to Commandant (CG-CVC) for resolution. For further information on stability see NVIC 3-97, "Stability Related Review Performed by The American Bureau of Shipping for U.S. Flag Vessels."
- d. Conducting the inspection. When possible, the initial inspection must be conducted throughout the vessel's construction and fit-out period, with a final review of the condition of the vessel and its equipment upon completion of the construction and fit-out.
- (1) Vessels being converted must be inspected throughout the conversion period.
 - (2) The inspector must bring any defects noted to the attention of the builder and contractor as soon as possible so that timely corrections can be made.
 - (3) The inspector must notify the OCM I of any controversial items so that they may be resolved, if possible, before work continues.
 - (4) See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter A2 concerning the handling of deficiencies.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- e. Scope of the inspection. The inspection must be sufficient to determine the following:
- (1) That the vessel is suitable for the service and route(s) in which it is to be employed.
 - (2) That the vessel is equipped with the proper lifesaving and fire protection appliances as prescribed by the regulations.
 - (3) That the vessel has suitable accommodations for passengers and crew.
 - (4) That the vessel is in a condition to warrant the judgment that it may be used in navigation with safety to life, property, and the environment.
 - (5) That the vessel fully complies with the requirements of applicable statutes and regulations, including those for pollution prevention and navigation safety in all other respects.
- f. Compliance with plans and specifications. The inspector must have corrected copies of the approved plans and specifications available when inspecting new construction or conversion. These are considered work copies, for the use of the inspector during construction and for the OCMI's files after construction. If additional copies are needed for office use or filing, they must be requested from the submitter.
- (1) Most plans and specifications are approved subject to comments in their transmittal letters. These letters are referred to in the approved plans and specifications and must be made available to the inspector who oversees the construction or conversion work. When approval is given subject to comments or recommendations of ABS or another recognized classification society, such comments or recommendations must also be made available to the inspector.
 - (2) Since equipment and system installations must be completed to the satisfaction of the OCMI, the inspector must check the complete installation for safety and compliance with applicable standards, as well as the plans and specifications. Any errors or omissions in plans that would result in unsafe conditions or noncompliance with applicable standards must be promptly brought to the attention of the builder and the OCMI for resolution.
- g. Restricted visibility from the navigating bridge. Restricted visibility from the navigating bridge is most often encountered on container vessels, large tank vessels with the bridge aft, vessels with oversize cargo handling gear, and special purpose vessels such as MODUs and crane ships; however, it may occur on any type of vessel.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (1) In most cases, this problem will be identified and resolved in plan review. In those cases when restricted visibility becomes apparent after the start of construction, the matter should be brought to the attention of the owner as early as possible, to avoid costly modifications late in the construction of the vessel. Technical guidelines for bridge visibility are contained in the MSM Volume IV, Technical, COMDTINST M16000.9 (series).
- (2) Causes of restricted visibility from the navigating bridge. These can be separated into two broad categories: those with a movable or temporary obstruction (such as container deck loads) and those with a permanent obstruction (as in a vessel structure).
 - (a) As situations of the first category are operational in nature, vessel certification should not be withheld for this type of visibility restriction. However, the problem should be brought to the attention of the owner so that the owner may take appropriate action to remove obstructions to visibility that interfere with the safe navigation of the ship.
 - (b) Situations of the second category are permanent in nature and cannot be operationally controlled after the vessel is in service. Therefore, a vessel with this type of obstruction should not be certificated when, in the opinion of the OCMI, visibility from the navigating bridge is restricted to such a degree that the vessel cannot be navigated safely.

NOTE: Tinted windows may also restrict visibility. They are prohibited by regulation (e.g., 46 CFR 92.03-1(c)) and by policy to meet the intent of the requirements of 33 CFR Part 164 to maintain clear unobstructed visibility for promoting safe navigation; unless it can be demonstrated that the amount of light transmitted through them is equivalent to that transmitted through clear glass.

- h. Trial trips. An inspector is required to observe the operation of each new vessel during a trial trip, once the vessel is complete and before initial certification. The specific regulations covering trial trips are in 46 CFR 58.01-30 and also in 46 CFR 31.10-40 for tank vessels. A vessel on a trial trip is not required to have a COI or a Coast Guard-issued certificate of documentation.
 - (1) For practical purposes, a new vessel on a trial trip is not required to be fully compliant with all COI requirements, because the trip is--
 - (a) Usually of short duration;
 - (b) Frequently made with Coast Guard inspectors aboard;

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (c) One of the final incidents of Coast Guard inspection prior to the initial issuance of a COI; and
 - (d) Usually made with the equipment required for a COI, with the vessel operated by licensed and certificated personnel.
- (2) An inspector observing a trial trip does not supervise and instruct vessel personnel. Specific matters may be referred to the inspector for advice, but the supervision of the tests according to the trial schedule rests with the builder's representatives. However, as part of the initial inspection of any vessel, the inspector may require such tests as he or she deems necessary to be assured of the safety and seaworthiness of the vessel.

2. Subsequent Inspections for Certification

- a. Intent. At subsequent inspections for certification, the inspector must ascertain that the vessel and its equipment are being maintained in a safe condition and in accordance with applicable laws and regulations, and determine whether changes have occurred in the vessel tending to make its continued operation unsafe. These subsequent inspections should be carried out with special attention to the condition of the vessel and its equipment.
 - (1) The inspector must be particularly alert for unauthorized changes to the vessel and its equipment.
 - (2) Upon completion of the inspection, the inspector and the OCMI must be satisfied that the vessel may be operated safely in the proposed service for the period covered by the COI, and that it otherwise complies with the applicable laws and regulations.
- b. Inspector's obligations. The inspector must use all available evidence when appraising the condition of a vessel and its equipment, including the latest inspection findings, records of previous Coast Guard inspections, the opinions or records of other interested surveyors or inspectors, information furnished by the officers and crew, facts concerning the vessel's classification, and previous certification. The inspector may seek the advice of experts in the particular field involved, such as boilermakers, shipfitters, and welders, or the opinion of more experienced inspectors or technical personnel assigned to his or her unit. Based on this evidence and his or her own inspection, the inspector must reach an independent conclusion as to vessel and equipment conditions and act accordingly. The OCMI must be consulted when there is doubt in the inspector's mind as to a proper course of action.

NOTE: See 46 U.S.C. 3315 concerning the disclosure of sources of information.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- c. Scope of inspection. The inspection must be of sufficient scope to determine the following:
- (1) That the vessel has a structure suitable for the service in which it is to be employed.
 - (2) That the vessel is equipped with the proper lifesaving, fire protection appliances, pollution prevention, and navigation safety as prescribed by appropriate regulations.
 - (3) That the vessel has suitable accommodations for passengers and crew.
 - (4) That the vessel is in a condition to warrant the judgment that it may be navigated safely.
 - (5) That the vessel, in all other respects, fully complies with the applicable laws and regulations.
 - (6) That the vessel's boilers, unfired pressure vessels, and all appurtenances thereof, as well as the propelling and auxiliary machinery, the electrical apparatus, and all other equipment comply with the applicable laws and regulations.
 - (7) That the vessel may be safely employed in its proposed service.

E. HULL INSPECTIONS

1. General Concerns

The inspector must determine the adequacy of the complete hull structure by the review of plans before construction; review of approved plans during construction, reinspections of the hull after construction, and examination of any repairs or alterations.

In certain cases, the OCMI may accept approved plans and the ABS Classification Certificate as evidence of the structural efficiency of the hull. However, the inspector must perform sufficient examinations and tests of the hull structure at the inspection for certification to determine that the condition of the hull is suitable for the vessel's service and is such that the vessel may be navigated safely.

Additionally, all protected and unprotected saltwater ballast tanks must be inspected at least twice in a 5-year period. The inspector must indicate which tanks have been examined.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

The inspector must ensure that the regulations regarding watertightness and weathertightness of the hull, including weather decks, are strictly enforced. The inspector must give particular attention to cargo hatches, closures, securing devices, gaskets, means of attachment, etc.

2. Older Vessels

- a. Inspection of older vessels. The determination of the true condition of a vessel and its equipment may be more difficult for an older vessel. The inspector should make every effort to research an older vessel's records to detect any recent structural, machinery or equipment failures/problems. An increase in the rate of failures may indicate a general deteriorating condition.
 - (1) The inspector is not limited by regulations from making tests or inspections as he or she deems necessary to be assured of the safety and seaworthiness of the vessel. Tests and inspections may include machinery tests, hull gauging (see F.3 below), inspections of equipment, etc., regardless of regulatory requirements or the type of inspection being performed (e.g., inspection for certification, reinspection, drydocking, or deficiency check.)
 - (2) The inspector should review the most recent hull gauging report as an aid in determining--
 - (a) Whether additional or new gauging is called for; and
 - (b) What area(s) of the hull might require special attention.
 - (3) Traveling Inspector (CG-54-TI) notification. Commandant (CG-5P-TI) must be notified when any vessel 20 years of age or older and over 4,000 GT is scheduled for an inspection for certification and/or drydocking. Traveling inspectors will attend selected older vessel inspections; therefore, notification as far in advance as possible is required.
 - (4) Special consideration. For those vessels that are not required to meet the load line regulations, special consideration must be given to hull structure and arrangement, freeboard, protection of openings, drainage, and the other items normally considered in the issuance of a Load Line Certificate. Since these items will not be checked by a load line "assigning authority," they must be attended to by the inspector.
-

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

3. Hull Gaugings

NVIC 7-68, "Notes on Inspection and Repair of Steel Hulls," gives guidance as to when an inspector should require limited or belt gauging. NVIC 7-68 urges the inspector to witness gauging at any periodic survey and make use of the results.

Additional gauging or gauging at an inspection that does not coincide with an ABS special survey should be required by the inspector when deemed necessary in order to determine the seaworthiness of a vessel. As per ABS rules, "The first Special Periodical Survey becomes due 4 years after the date of build. Subsequent Special Periodical Surveys are due four years after the previous Special Survey." ABS may defer special surveys for up to 12 months.

4. Load Lines

Certain vessels in ocean, coastwise, or Great Lakes service are required to meet the requirements of 46 CFR Subchapter E (Load Lines) with respect to strength, closure of openings, protection of openings, guardrails, freeing ports, means of access, etc.

Inspections for compliance with these regulations are made by ABS or another assigning authority approved by the Commandant. A current Load Line Certificate will normally be accepted by the surveyor or inspector as evidence that the vessel meets the requirements of 46 CFR Subchapter E.

Although load line assignments are made by an assigning authority, the enforcement of load line requirements rests with the Coast Guard. Therefore, marine inspectors should examine the weathertightness of cargo and other hatchways covered under the load line regulations during routine vessel inspections.

If the surveyor or an inspector discovers that a vessel holding a current Load Line Certificate is not in compliance with the regulations, or that the condition of any fitting covered by such regulations is not satisfactory, they must inform the OCMI and ensure corrective action to achieve compliance is taken.

- a. Weathertight and watertight. For regulations concerning weathertight and watertight standards, see 46 CFR 42.09-25(b)(3), , and 42.15-30. See also paragraph 6.F.5 below.
- b. Master's responsibility. Regulations also task the vessel's master with the responsibility of ensuring that all exposed cargo hatches are properly secured prior to leaving protected waters. See 46 CFR 78.17-35, 97.15-20, and 196.15-20.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

5. Watertight and Weathertight Inspections

At inspections for certification, the adequacy of watertight and weathertight fittings and closures will be determined. An operational test of hatch covers will normally be witnessed and tightness of hatch covers verified. If practicable, such tests should be performed at the same time that the load line-assigning authority is performing an annual or periodic load line survey.

During periodic inspections, watertight and weathertight closures and fittings must be examined to the extent necessary to ensure that they are being properly maintained. The following additional guidance and standards apply to watertight and weathertight inspections:

- a. Watertight. Watertight closures such as cargo ports and other similar openings in the sides of vessels below the freeboard deck must be designed to ensure the same watertightness and structural integrity commensurate with the surrounding shell plating (46 CFR 42.15-55). The small passenger vessel regulations previously defined watertight as to effectively resist the passage of water when subjected to a hose test of 30 psi. Gaskets must be clean (unpainted) and flexible to provide a tight seal. Coamings and knife-edges should be structurally sound, straight, and true.

NOTE: For vessels inspected under Subchapter T and Subchapter K., see 46 CFR 179.310, and 46 CFR 116.1160 respectively.

- b. Weathertight. Weathertight means that water will not penetrate into the vessel in any appreciable amount in any sea condition (46 CFR 42.13-15).
 - (1) Hatchcovers closed by portable covers must be secured weathertight as required in 46 CFR 42.15-25.
 - (2) Weathertight fittings for small passenger vessels must be constructed to effectively resist the passage of water to appreciable degree under continuous exposure to driving rain or spray. Vents, cowlings, coamings, etc., should be sound, properly fitted, and secured to prevent flooding from boarding seas.
- c. Vessels of unique design. Special emphasis on weather deck openings should be placed on vessels of unique design. Even a small amount of flooding can appreciably affect stability on MODUs, hovercraft, pontoon hulls, etc. The OCEAN RANGER casualty emphasized the need to prevent and detect flooding in unmanned spaces when the chain locker flooded from boarding seas. Chain locker covers serve to reduce the amount of downflooding through the spill pipe or spurling gate and can be made more weathertight by stuffing rags, cement, or gasket material around the chain prior to heavy weather.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- d. Securing devices. Hinges, locking mechanisms, retaining brackets, dogs, and other securing devices should be sound and operate freely. Covers must be readily available and easily secured for closing in the event of fire as well as heavy weather.
- e. Repairs/Strength. All closures and securing devices must be able to withstand the forces of boarding seas. Repairs must maintain the structural integrity of the closure. Inspectors should not allow the use of plastic putty, e.g., "red hand," to repair strength members of cargo hatch covers. NVIC 7-68 must be used as guidance for the repair of steel hatch covers.
- f. Testing of closures. Testing of closures may be done visually by light testing, pressure testing, or hose testing. Watertight closures or fittings should be tested under the design pressure where practicable. Otherwise, a hose test over 30 psi may be accepted. Weathertight fittings should be hose tested for several minutes and allow no more than a slight seepage of water to pass. An operational test should be performed on hatch cover closure devices.
- g. Freeing ports. When conducting a compliance exam boarding of a fishing vessel or inspecting a charter fishing boat, inspectors should examine the freeing ports to ensure they are clear, and if fitted with "flapper" closures, that they are operable and will allow water on the deck to clear over the side. The charter fishing vessel COUGAR is an example of a vessel foundering and sinking due to an accumulation of water on the aft deck due to inoperable freeing ports.
- h. Hatches – watertight integrity. Manhole covers installed in watertight double bottoms on small passenger vessels must be inspected to ensure they meet a suitable watertight reliability performance standard.
 - (1) Inspectors should examine all hatch covers to ensure that the gasketing material is in place and that it provides the designed watertight integrity, and that the hinges and securing devices are operable. This includes all watertight doors, hatch covers, and manhole covers to all integral hull tanks (voids, ballast, etc.), especially the o-rings on the single bolt tank covers.
 - (2) A failed tank cover was identified as a problem in the grounding of the small passenger vessel YORKTOWN CLIPPER when the void tank cover o-ring failed causing flooding of the accommodation spaces.

6. Bulkhead Penetrations

The use of epoxy resin as a pipe seal in watertight bulkheads is considered satisfactory when the maximum piping temperature does not exceed 200°F and structural fire protection qualities are not required by the regulations. Accordingly, epoxy resin should only be used as a pipe seal in watertight bulkheads on passenger vessels if the passenger vessel is less than

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

100 GT. The resin should be subjected to the appropriate standard fire test as required by 46 CFR Part 72.

F. MACHINERY INSPECTIONS

1. General

At each subsequent inspection for certification, the inspector must examine a vessel's machinery as required by law and regulations. Inspections and tests must be performed to ensure that main and auxiliary machinery, boilers and their appurtenances, and other equipment are in satisfactory operating condition and suitable for the intended service. To help with this determination, the inspector must ask the chief engineer or officer in charge of the machinery about possible defects or imperfections in the equipment, boilers, and machinery of the vessel.

The inspector should keep safety requirements foremost in mind during the inspection of engineering equipment. The requirements of 46 CFR Subchapter F (Marine Engineering) and the instructions in this manual are not intended to cover all contingencies that may be encountered during an inspection. The inspector may require any reasonable tests or inspections deemed necessary to ensure the safety of the vessel. It is incumbent upon the inspector to be alert to unsafe conditions and to require corrective measures before these conditions can cause casualties.

2. References

46 CFR Subchapters F and J contain the primary standards for the inspection of main and auxiliary machinery installations on all vessels except small passenger vessels inspected under 46 CFR Subchapter T. As indicated in 46 CFR 58.01-5, these standards are supplemented by the ABS's standards. 46 CFR Subchapter F regulations apply to T-boats only insofar as they are made applicable by 46 CFR Part 182. As provided in 46 CFR 167.25-1, boilers and pressure vessels and their piping and appurtenances on public nautical school ships must conform to the requirements of 46 CFR Subchapter F, or to U.S. Navy or Coast Guard Standard Construction Specifications.

3. Vessels that are Not Classed

On vessels that are not classed by a recognized classification society, the inspector must, when practicable, require and observe an operational test on all main and auxiliary machinery to determine that its condition is satisfactory. The inspector may require an operational test of any machinery when necessary to determine its condition.

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

4. Inspection of Main Propulsion Machinery

- a. **The inspector shall be generally guided by section B.1.F.1 above in the inspection of main propulsion machinery for certification. Typically, main and auxiliary machinery and associated equipment are tested at each inspection for certification and periodic inspections; see 46 CFR 61.20-3.**
- b. **Overspeed and low oil pressure trips. The inspector shall determine during inspection by whatever practical means may exist that the overspeed mechanisms, low lube oil pressure shut-down devices, turbine governor mechanisms, and throttle valves and their linkage are in proper operating condition. Where possible the inspector shall require operational tests to check these devices or mechanisms. Any malfunction of the foregoing items shall be corrected. Further references to low lube oil shutdowns can be found at 46 CFR 56.50-80(b), (g), and (i) and 46 CFR 58.05-10.**

NOTE: Any operational tests of lube oil shutdown controls should not risk shutting off the oil supply to the bearings. Tests of the overspeed safety devices should be as per the approved automation procedures.

- c. **Automated Machinery: When main propulsion machinery is automated, the equipment shall be witnessed by an inspector and verified to the system design requirements and regulations provided in 46 CFR 62 'Vital System Automation'. This is, in part, intended to address system updates or modifications and to ensure continued safe operation. Testing of all systems should be conducted in accordance with the approved periodic safety test procedures (PSTPs) and as described in 46 CFR 61.40-6 and 61.40-10.**
- d. **Main engine gravity-type lubricating systems. In one casualty reported aboard a C3-S-A2 cargo vessel, the propulsion turbines sustained extensive damage due to insufficient lubricating oil. Investigation revealed that a closed or partially closed valve in the piping system from the gravity tanks to the main engine caused a reduced flow of oil to the turbines. This valve was marked "L.O. GRAVITY TANKS TO GEARBOX" and was located approximately 4.57 m (15 ft) from the starboard gravity oil tank. The valve was not included in the original approved plans of the piping system and, since it was in addition to the shutoff valves at the tanks, there was no justification for its being in the system. Because a similar condition may exist on other vessels, the following actions must be taken:**
 - (1) During the inspection or reinspection of vessels with gravity-type lubrication, the discharge piping from the gravity tanks must be examined.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (2) If shutoff valves are found in addition to those at the gravity tanks and unnecessary to the system, they must be secured in the open position or removed.

G. INSPECTION AND HYDROSTATIC TESTS OF BOILERS

**TABLE B1-1: TITLE 46 CFR, 61.05-10 – INSPECTION INTERVALS FOR BOILERS
W/FOONOTES**

TABLE 61.05-10—INSPECTION INTERVALS FOR BOILERS¹²³

	Firetube boiler ≥150 psi	Watertube boiler	Any firetube boiler for propulsion	Firetube boiler <150 psi
Hydro Test:				
Passenger Vessel	2.5	2.5	1	2.5
Other Vessel	2.5	5	1	5
Fireside Inspection	1	2.5	1	2.5
Waterside Inspection	1	2.5	1	2.5
Boiler Safety-Valve Test	1	2.5	1	1
Valves Inspection	5	5	5	5
Studs and Bolts Inspection	10	10	10	10
Mountings Inspection	10	10	10	10
Steam Gauge Test	2.5	2.5	2.5	2.5
Fusible Plug Inspection	2.5		2.5	2.5

¹All intervals are in years.

²Where the 2.5-year interval is indicated: two tests or inspections must occur within any five-year period, and no more than three years may elapse between any test or inspection and its immediate predecessor.

³Intervals for hybrid boilers are the same as for firetube boilers.

1. General

Marine boilers have historically been classed into two general types: firetube (or "tank") boilers and watertube boilers. A new type of marine boiler, called a hybrid boiler, has **since** been approved for auxiliary steam use aboard U.S.-flag vessels. The American Society of Mechanical Engineers (ASME) Manufacturers' Data Report forms must be made available to the Coast Guard marine inspector for review at the time of any boiler installation, per 46 CFR 52.01-145. The marine inspector will inspect each boiler after installation and review the Data Report forms to ensure the boiler complies with Coast Guard regulations. See 46 CFR 52.01-135 and 53.10.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

In addition, low pressure hot water boilers can be encountered on any number of Coast Guard inspected vessels. While they are typically small self contained units with limited safeties and controls, they do present a very real hazard to life and property if not in good repair, with all safeties and controls in working order.

- a. Firetube boilers. The most common firetube boiler is the "Scotch" type. **Now obsolete in riveted form, they are limited to historic or older vessels propelled by reciprocating engines with very simple boiler feed systems. Some may be coal-fired.** Feed water control is primitive at best and, generally, no provision is made for keeping dissolved oxygen out of the boiler water.

In modern welded form, fire tube boilers are rarely seen as propulsion boilers except on Western Rivers steamers. They are most commonly installed as auxiliary boilers on ships with diesel propulsion or on barges where heated cargo systems are required.

- b. Watertube boilers. Watertube boilers are designed for operation under considerably greater stresses than firetube boilers.
- (1) Since the tube **metal temperatures are also** higher, scale deposits that **can be tolerated** in firetube boilers **at lower pressures** are unacceptable in watertube boilers. For these reasons, only distilled water can be used for boiler feed and close regulation of the feed water chemistry is essential to prevent pitting of the boiler metal and to reduce scale deposits to a minimum.
 - (2) Compared to firetube boilers, the pressure-containing parts of **modern, welded** watertube boilers are of simple design, without complicated riveted seams and stayed surfaces. Repair frequency is considerably lower and, when repairs are necessary, they involve **relatively less complicated** operations, **such** as tube renewals, refractory and insulation repairs and renewals, and boiler casing maintenance.
 - (3) **Watertube boilers are also more sensitive to improper operation and inadequate maintenance. Tube temperatures are normally so high that even a thin scale deposit on the tube interior seriously impairs heat transfer which may result in tube failure. Cleanliness of the fireside is equally important to prevent loss of metal from corrosive elements in the fuel used. Economizers and air heaters located in gas passages must be kept free of soot deposits to reduce fire hazard.**
- c. Hybrid boilers. Hybrid boilers incorporate a design feature which combines the concepts of both firetube and watertube boilers. The concept makes efficient use of space and consumes less fuel than a traditional firetube boiler.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (1) Hybrid boilers usually burn number 6 fuel oil, but can also burn a variety of other fuels, including heavy oils, sludge, and solid waste with a few additional pieces of equipment.
 - (2) Current designs average about 1.53 m (5 ft) in outside diameter, 3.66 m (12 ft) in height, and consist of upper and lower chambers connected by a tube nest.
 - (3) Certain designs have incorporated engine exhaust gas firing along with in-port oil firing, thus eliminating the need for a ship's exhaust gas economizer. The burner and register unit is mounted at the boiler front on the lower chamber and is exactly the same type of unit that would be found on a traditional firetube boiler. Standard appurtenances such as safety valves, water glasses, feed and stop valves, steam gauges, and blow-off valves are also incorporated in present design features.
 - (4) Current furnace designs consist of horizontal cylindrical or vertical torispherical type configurations. Horizontal types are connected to the boiler shell by full penetration welds. The vertical furnaces are attached to the shell by an ogee ring which can either be integral to the furnace or be an external support flange. The ogee ring must be joined to the furnace by a full penetration weld. The connection of the ogee ring to the boiler shell must either be a full penetration weld if an external support flange, or a fillet weld if an integral type ogee ring. The integral type ogee ring must meet ASME Section I PFT 20.5.
 - (5) Depending upon size, the furnace may be supported by a number of stays that extend from the furnace to the boiler shell. The number of stays used for support depends on the furnace size and the maximum allowable working pressure (MAWP) of the boiler. In some cases, stiffening rings are used to add support to the furnace in lieu of stays.
 - (6) At the apex of the furnace, an exhaust pipe extends from the furnace into the lower boiler tube sheet. This pipe passes the exhaust gas over the steam generating tubes before the gas exits through the flue. Steam generating tubes connect the lower tube sheet to the upper tube sheet. There may also be downcomer tubes installed in the tube nest between the two tube sheets. Within the tube bundle are several stay tubes whose function is to add support to the tube sheets. Above the upper tube sheet, in the upper chamber, is the steam-generating area. The dry pipe is located near the center of the upper head. Future designs may incorporate variations on this basic theme.
- d. **Low Pressure Steam and Hot Water Boilers on Small Passenger Vessels (SPVs):** Field observations indicate there is confusion on the inspection requirements for low pressure packaged boilers. In some cases, they are not being inspected at all when found on SPVs inspected under 46 CFR Subchapters K and T. These units may generate steam or supply hot water. A typical installation operate at

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

pressures ≤ 15 psi for steam, at ≤ 30 psi for hot water and are constructed of cast iron materials or operate ≤ 100 psi if constructed of wrought iron and are “fired”.

- (1) OCMI's are encouraged to ensure properly qualified MIs are involved in oversight and/or inspection of these units because of the inherent safety risk.
- (2) Requirements are in 46 CFR 119.310 for and 46 CFR 182.310 for small passenger vessels. Applicability of 46 CFR Subchapter F is in Table 54.01-5(a). Regulations indicate there are inspection requirements if boilers are made of wrought iron operated at ≤ 15 psi for steam and ≥ 100 psi for hot water or have a hot water temperature ≥ 250 degrees F. Cast iron boilers operated at ≤ 30 psi or ≥ 250 degrees F for hot water also have requirements. These are provided in 46 CFR 54.01-10 and 54.01-15.
- (3) 46 CFR 53.01-10(c)(2) indicates oil fired boilers must meet the requirements in 46 CFR Subchapter F, Part 53 regardless of size or heat input. However, it is important to note Subchapter F's applicability for auxiliary and heating boilers on SPVs shall be “*as determined necessary by the OCMI.*” See 46 CFR 119.310(c) and 182.310(c), which also indicates that “*heating boilers must be tested and examined every three years.*” For low pressure packaged boilers, applying Subchapter F in its entirety may not be reasonable or necessary to ensure an appropriate level of safety.

If electrically fired, U.L. approved hot water supply boilers with a capacity < 120 gallons, and a heat input ≤ 58.6 KW (200,000 BTU/ HR) are exempt from 46 CFR Part 53. However, this is provided there is a safety/relief valve installed in accordance with 46 CFR 53.01-10(c)(1). Also see Note 4 of 46 CFR Table 54.01-5(a) regarding relief devices.

- (4) Boiler plates require an ASME stamp. If built to ASME Code Section I (Power Boilers) or ASME Code Section IV (Heating Boilers), the plate will be stamped with the “S” or “H” symbol.
- (5) 46 CFR 63.10-1 requires two copies of detailed instructions for operational tests on each “automatic” auxiliary boiler. A certification report detailing compliance with, ASME and 46 CFR Part 63 is also required. All should be submitted to MSC for approval prior to installation or replacement of a unit. OCMI's should retain copies for local record.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

2. Examination and Testing of Firetube Boilers

- a. Test and examination intervals. Title 46 CFR Subchapter F, Part 61 requires annual **fireside, waterside and hydrostatic tests** for propulsion firetube boilers. No extension of these requirements is authorized. However, **auxiliary firetube boilers require fireside, waterside and hydrostatic tests less frequently at intervals specified in 46 CFR Table 61.05-10.**
- b. Hydrostatic tests. Firetube boilers are particularly vulnerable to thinning of the plating, tubes, and staybolts (if not welded construction) by corrosion. This is often seen in the form of pitting, attributed to dissolved oxygen or the use of corrosive boiler water.
 - (1) The hydrostatic pressure should be maintained at 1.5 times the MAWP throughout the inspection of the fireside.
 - (2) When boiler repairs are necessary, the methods, materials, and workmanship employed must comply with the requirements of 46 CFR Part 59.
 - (3) In Scotch-type boilers, pitting is commonly found on the outside of the tubes and the shell and head plating near the waterline, the combustion chamber top plating, the furnaces, and the bottom shell plating. If riveted, the numerous highly stressed joints in firetube boilers are prone to attack by stress corrosion cracking, generally resulting from the deposit of corrosive solids contained in the boiler water.
- c. Interior examination. The interior examination of a firetube boiler should occur first and be conducted as follows:
 - (1) The interior of the furnaces and combustion chambers should be examined first. Furnaces should be checked for distortion by measuring with a tram bar. When corrugated or plain furnaces are distorted and no longer in true circular shape, they must be repaired as required by 46 CFR 59.15-1(a) or the boiler pressure must be reduced as required by 46 CFR 59.15-1(c).
 - (2) Combustion chamber wrapper plates and back plates should be hammer tested, and areas suspected of being thin should be drilled and gauged. Broken combustion chamber stays will generally be indicated by leakage from the drilled telltale holes. The combustion chamber back plate should be checked for evidence of bulging plating between the staybolts.
 - (3) Riveted wrapper plate seams and the furnace connection to the combustion chamber should be checked for leakage. The back tube plate should be carefully

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

examined since leakage in this area, which cannot be corrected by rolling tubes, is sometimes due to cracks in the ligaments between tube holes.

- (4) Tube sheet examination. The front tube sheet should be examined next. This is an area particularly susceptible to corrosion from leaking tubes, and to erosion caused by the use of saturated steam for soot blowing. Leaking tubes should be made tight by rolling, or should be replaced.
- e. Exterior examination. The exterior examination of a firetube boiler should occur as follows:
- (1) The exterior of the boiler shell and heads should be examined first. All lagging of the shell and heads is not normally taken off during annual inspections; however, all portable sections should be removed while the hydrostatic pressure is maintained. Wherever moisture appears, sufficient lagging should be removed to determine its source, whether leaking seams, broken staybolts, or defective boiler mounting gaskets.
 - (2) The plating in way of the boiler mountings should be examined for evidence of wastage due to leaks from valves and fittings. Leakage from the bottom of the front and back heads in way of the flanging of the plate should be noted for further examination of the inside of the head; cracks induced by flexing of the head sometimes penetrate the plating.
 - (3) Riveted seams showing evidence of leakage should be carefully examined; cracks occasionally occur between rivet holes or extend from rivet holes to the plate edge.
 - (4) The manhole gasket seats and adjacent plating should be checked for signs of wastage due to gasket leaks; the radial clearance between the manhole plate and the head should not be excessive.
 - (5) The boiler saddles, foundations, and collision chocks should be hammer tested to detect evidence of deterioration; these members are subject to severe wastage from the corrosive action of bilge water.
 - (6) The hydrostatic pressure should then be released and the boiler drained out.
- f. Examination of the boiler waterside. The inspection of the waterside of the boiler should occur as follows:
- (1) The inspection of the waterside of the boiler is most conveniently begun by entering through the top manhole. The dry pipe, internal feed lines, and surface blow pipe should be examined first; defective gaskets at the point of attachment of the internal feed lines to the boiler head are frequently the source of erosion of the plating.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (2) **In riveted construction, the** butt strap and the rivets attaching the heads to the shell should be sounded with a hammer. Where rivets are found to be loose or rivet heads missing, the rivet holes should be searched for cracks by nondestructive testing methods after the rivets are removed.
 - (3) **In other than welded construction and when installed, the** stay rods, girder stays, and combustion chamber tops should be examined for evidence of wastage due to corrosion. The screw stays at the back and sides of the combustion chambers are difficult to examine because of close clearances. However, a good evaluation of the condition of these members can be made with the use of a portable electric light lowered successively between the rows of stays. The most common deficiency found in these stays is "necking," a reduction in diameter near the plate surface caused by corrosion and stresses from expansion of the combustion chamber.
 - (4) The boiler tubes are so closely spaced that visual inspection must usually be confined to the top and side rows. Pitting is frequently seen in these tubes. **Shallow**, widely scattered pits can usually be disregarded, but deep pits extending over a large area may so reduce the wall thickness that replacement of tubes is necessary (from the standpoint of stress, tubes will satisfactorily function with a reduction of wall thickness of up to 50 percent). In any event, when evaluating the condition of boiler tubes, a distinction must be made between plain tubes and stay tubes; stay tubes have a much greater initial wall thickness.
- g. Completing the boiler examination. Finally, the lower part of the boiler interior is inspected as follows:
- (1) The most common defects in this area are corrosion of the plating of combustion chambers, furnaces, shell, and heads by pitting, and grooving of the flanged plating of the heads and furnaces.
 - (2) Pitting often attacks the plating of the furnaces, combustion chamber wrapper plates, back plates, and the bottom plating of the boiler shell.
 - (3) Grooving due to thermal stresses is frequently seen in the flanges of the front and back heads, and at the connections of the furnaces to the combustion chambers.
 - (4) Radial grooving, originating in the holes drilled in the front and back heads for the stay rods (when installed) and extending in a "spider web" from these holes, is occasionally encountered.

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**3. Inspection of Watertube Boilers**Test and examination intervals.

- a. Inspection of watertube boilers. Title 46 CFR Subchapter F, Part 61 requires hydrostatic tests for all watertube boilers **every five years (twice in 5 years with no more than 3 years between any test or inspection and its immediate predecessor, in the case of passenger vessels) as specified in 46 CFR Table 61.05-10. Watertube boilers require fireside and waterside inspections twice in 5 years with no more than 3 years between any test or inspection and its immediate predecessor.**

Following repairs and at the conclusion of inspections, watertube boilers should always be hydrostatically tested to a minimum of 1.25 MAWP **per 46 CFR 61.05-10. (If substantial modifications or repairs have been made, or if the marine inspector has reason to question the strength of the boiler, to 1.5 MAWP).**

Substantial repairs are welding on a header or a drum. Tubes that are welded rather than expanded into headers should be considered substantial repairs. New piping or welded repairs on piping attached to the boiler as well as waterwall or superheater headers newly fabricated and installed would be substantial repairs.

Replacing or plugging tubes is not a substantial repair. Boiler tubes that have been replaced should be hydrostatically tested to 1.25 MAWP. Tubes that have been plugged can be hydrostatically tested to operating pressure.

Questionable boiler strength would be the existence of widespread pitting, header grooving, a recent history of tube failures or sitting idle for a long period of time. An inspector should have a reasonable level of confidence that the boiler will steam at normal operating pressure without leaking, and questions of boiler integrity should be resolved through testing.

- b. Interior examinations of watertube boilers. The inspection is most conveniently begun inside the furnace, as follows:
- (1) The waterwall tubes and screen tubes should be examined with the aid of a spotlight for evidence of blistering or distortion. Severely blistered tubes should be renewed. A minor amount of tube distortion is acceptable if the insides of the tubes are clean. If there is evidence of tube leakage at the ends of the waterwall tubes, sufficient refractory should be removed to expose the waterwall headers so that the leakage can be traced to its source.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (2) The superheater and part of its support structure can generally be seen from inside the furnace. In this area, burned support brackets and badly warped superheater elements are common defects.
 - (3) The baffles above and below the superheater in D-type boilers should be examined. Some boilers of this type are fitted with feeder tubes in the furnace floor, which can be examined only when the brickwork is removed. Defects in these tubes, however, are rarely encountered; the furnace floor should be disturbed only when leakage is suspected or for refractory repairs.
 - (4) Furnace refractory is subject to damage from erosion due to direct flame impingement, fusion occurring at high rates of combustion, and destruction of insulation due to improper drainage during water-washing operations. When the damage is local, the defective area may be repaired; however, it is sometimes necessary to rebuild the walls or floor.
- c. Exterior examinations. The inspector should continue with an exterior examination, as follows:
- (1) The tubes and headers of economizers and gas air heaters are vulnerable to external corrosion due to condensation and should be examined through the access openings.
 - (2) The steam drum and its accessories should be carefully checked; if a hydrostatic pressure test is applied, the nozzles, gaskets, and welded pipe connections should be searched for leakage.
 - (3) In D-type boilers, the sliding feet that permit linear expansion of the water drum should be examined.
 - (4) Expansion of the generating tubes of straight tube boilers is accommodated by bolting the front headers rigidly and securing the back headers with loosely fitted bolts; the condition of these bolts should be checked.
 - (5) In sectional header boilers, the riser tubes, drum nipples, and top row of generating tubes can be reached for examination from the access opening below the steam drum.
 - (6) Removal of the superheater access doors in D-type boilers will permit access to the superheater and the lower part of the steam drum. In both boiler designs, the casing in way of the steam drum should receive attention; gas leakage in this area is common. The casing below the steam drum should be examined; burning or bulging of this casing or distortion of access door frames is usually due to destruction of the insulation. If these conditions are found, the buckled casing must be removed so that the insulation can be replaced.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- d. Header examinations in sectional header boilers. The headers of sectional header boilers should be examined next, as follows:
- (1) Leaking handhold plates should be marked for later removal and renewal of gaskets. The gasket surface should be examined with the aid of a mirror; chronic leakage is sometimes due to steam cuts across the seating surface.
 - (2) The handhold plates of superheater headers should be similarly examined, and the superheater tubes should be checked for leakage where these tubes are rolled in the headers.
 - (3) The short nipple connections of the transverse mud drum to the front headers and the bottom blow valve connection to this header should be checked for leakage; external corrosion of the nipples is sometimes encountered.
 - (4) The tube joints, handhold plates, and drain nipples of the waterwall headers should be checked for evidence of leakage and external corrosion. The air duct beneath the furnace floor should be examined to ensure that it is free from accumulation of oil.
- e. Header examinations in D-type boilers. The superheater headers and waterwall headers of D-type boilers should be examined as follows:
- (1) The vestibule below the economizer or air heater should be opened and cleaned. In this area, the ends of the generating tubes, at the connections to the bottom drum, can be seen. Because of the close spacing of the tubes, inspection is usually limited to the outer rows; however, external corrosion of these tubes, due to soot deposits and improper water-washing, is not uncommon.
 - (2) The bottom drum manhole opening, bottom blow valve connection, and drum support saddles should be examined. In this area, leakage and associated wastage are rarely seen; however, the foundations of boilers installed directly on the tank tops are subject to wastage from the corrosive action of bilge water.
- f. Examinations of the waterside. The waterside should be examined as follows:
- (1) The interior of the steam drum is the best starting point for inspection of the waterside of the boiler.
 - (2) The flanged piping connections of the desuperheater and internal feed lines should be hammer tested; if the tightness of the desuperheater piping is in doubt, it should be hydrostatically tested. **Typical hydrostatic test pressures to test a desuperheater range from 150 to 300 psi. The actual hydrostatic test**

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

pressure to be used, of course, must be obtained from the tested boiler technical manual.

- (3) The steam drum should be thoroughly cleaned prior to inspection; portions of the drum internal platform should be removed to permit a close examination of the drum interior and the tube ends. Pitting along the waterline, in the bottom of the drum, and in the ends of the riser tubes and generating tubes, is occasionally found.
 - (4) The brackets supporting the dry pipe, internal feed lines, and desuperheater should be examined to ensure that the securing bolts are tight.
- g. Examination of tubes.** Tubes should be examined as follows:
- (1) A sufficient number of handhold plates should be removed from the headers of the generating tube bank, superheater, economizer, and waterwall tubes to permit a comprehensive examination of these tubes.
 - (2) In addition to tube inspection, handhold plates should be opened to permit inspection of header baffle plates, orifice plates, drain locators, branch lines, inlet/outlets, elbows, thermometer wells, and other locations subject to high stresses or corrosion.
 - (3) Generally, removal of 5 percent of the handhold plates will suffice; however, if internal pitting or an excessive amount of scale is found, it may be necessary to remove all of the handhold plates for a complete examination.
 - (4) Scale deposits exceeding 1/32" in thickness will seriously impair heat transfer, especially in screen tubes and waterwall tubes, and may result in bulgin and distorted tubes. Scale should be removed by mechanical means or by chemical washing.
 - (5) Examination of tube interiors is difficult in D-type boilers because the tube bends preclude sighting more than a short distance inside each tube. However, the tubes should be inspected from within the lower drum and, with the aid of a mirror, from the waterwall and superheater headers. The inside surface of the bottom drum should be examined for evidence of pitting; this is occasionally seen in boilers that have been out of service for long periods of time.

4. Examination of Hybrid Boilers

- a. Hybrid boilers are very compact in their construction as a result of the design efforts to comply with size restrictions imposed by ship builders. They are considered to be

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

auxiliary heating boilers, and their operating controls are regulated under 46 CFR 63, depending upon fuel consumption and rated heat output.

- b. Tests. For test purposes, these boilers are considered to be of the firetube type and must be hydrostatically tested at least annually, per 46 CFR 61.05-10.
- c. Fireside and waterside examinations. The limited access available for internal examinations of these boilers presents some unique inspection problems. Methods available to perform internal examinations are few and certain areas of these hybrid designs demand special attention by the marine inspector.
 - (1) The tube sheet ligaments, if accessible, should be thoroughly examined for cracks, especially near the furnace area. To the extent possible, the tube sheets should be examined for distortion or other indications of surface deterioration.
 - (2) Uptake/flue pipe between the top of the furnace and the lower tube sheet should be examined for possible yielding of the material caused by excessive heat either from normal firing with a low water level or extreme high firing rates for extended periods of time. The external pressure exerted on a horizontal cylindrical furnace or an uptake pipe will eventually cause the pipe to fail after being subjected to these conditions.
 - (3) The fireside of the furnace should be examined for brickwork damage or deterioration.
 - (4) All accessible waterside areas of the furnace should be examined for signs of pitting, cracks, and scale. A serious scale build-up or pitting on the furnace plate's waterside can be indicative of a poor boiler water treatment program.
 - (5) During the waterside exam, the furnace and shell surfaces in the vicinity of the ogee ring (and the ring itself) should be thoroughly examined. This area supports a majority of the load and is susceptible to very high stresses. If evidence of deterioration or distortion is found, nondestructive testing should be performed on the welds, which connect the ogee ring to the shell, and to the furnace. Any problem involving the ogee ring should be investigated from both the internal and external vantages, on the ring's inner and outer diameters.
- d. Stays. Boiler stays should be carefully examined for cracks, especially in way of the welds. Stays should be examined to detect "necking" or similar evidence of deterioration.
 - (1) One method to evaluate the condition of a boiler stay is to strike it with a hammer and listen carefully to the resulting sound. Generally, if the stay is in good condition, it will make a ringing sound when struck. A dull sound is indicative of a cracked or otherwise deteriorated stay and; a stay that produces a dull sound upon testing should be thoroughly inspected for defects.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (2) Other forms of nondestructive testing, such as dye-penetrant or magnetic particle, can be used to determine a stay's condition. When several stays in one area are found to be defective, the problem is nearly always due to uneven loading on the support structure, a condition that should receive immediate corrective action.

5. Examination of Low Pressure Steam and Hot Water Boilers on SPVs

- a. **Fireside/Waterside (Internal) Exams:** These are prescribed in 46 CFR 61.05-10(a) and the Table to 61.05-10. In order to fully comply with 46 CFR Subchapter F, the removal of the discharge or outlet valve and the safety/relief valve will be required. This will provide sufficient access to the waterside and allows MIs to identify the presence of scale or rust accumulation on internal components. If the internal condition of the heating element is suspect, additional action would be required to assess the condition of the boiler. Removing the burner assembly for a visual exam of the furnace should generally satisfy the requirements for a fireside exam. If the condition of the heating element or refractory is suspect, removal of the first section of the unit's stack casing should provide enough access to determine if further action is necessary.

Enforcing the internal exam requirements on automatic low pressure packaged heating boilers, although applicable, is problematic on SPVs. The waterside has limited access through boiler drains, outlets and safety/relief valves. The fireside exam, although more accessible, may not be necessary if the unit was examined by an accepted third party and found satisfactory. More importantly, a SPV operator's experience may be limited for disassembly and proper re-assembly of these units. Conducting such work may cause more harm than good.

To address the lack of operator experience, some OCMI's have a local policy which ensures untrained operators do not disassemble these units, conduct internal exams or hydro tests. In lieu, they allow an acceptable third party (e.g. state licensed boiler service provider or manufacturer certified technician) to perform "servicing" of boilers. Servicing should be completed every 3 years or more often if recommended by the manufacturer. When the OCMI accepts a service report in lieu of inspection, MIs should require removal of the burner assembly for a cursory furnace exam. This should be followed by a subsequent external visual exam while the unit is operating.

- b. **Hydrostatic Tests:** 46 CFR 61.05-10(c) indicates that a boiler hydro should be completed at 1.5 times MAWP if the findings from a visual exam of the heating element identifies a suspect condition. A hydro at 1.25 times MAWP may also be required at regular intervals if the OCMI deems it necessary to meet 46 CFR Subchapter F. Hydro water temperature should range between 70 and 100

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

degrees °F in accordance with 46 CFR 61.05-5(b). The hydro pressure should be held for 10 minutes and should remain constant.

- c. **Safety/Relief Valves:** Tests should be completed per 46 CFR 61.05-10 with the valves in-service or they can be removed and bench tested. Hand lifting gear should be exercised when the boiler is in-service. Caution should be taken when exercising hand lifting gear due to the discharge of steam/hot water. All safety/relief valves must have an ASME “H” or “HV” stamp in accordance with 46 CFR 52.01-2. The discharge should be per 46 CFR 56.50-25(c).

If the unit is a hot water boiler, it requires a combination pressure/temperature relieving device in accordance with 46 CFR 53.05-2(c). Some OCMI policies allow valves to be visually examined and ‘popped’ while in service. This is typically done during annual inspections. MIs should be aware that this test method only ensures the pressure functionality of the valve. To ensure safety, these valves should be properly tested for temperature and/or pressure accuracy by the accepted third party to satisfy regulation. This test is normally required every 3 years as implied in 46 CFR 119.310(c) and 182.310(c).

- d. **Boiler Mountings:** Mounting inspections on low pressure boilers include the water inlet/outlet valves and the safety/relief valve. However, any valves installed as the first valve isolating boiler pressure also need to be inspected. Mounting inspections are required every 5 years and removal every 10 years in accordance with 46 CFR Table 61.05-10 and Marine Safety Manual Volume II, COMDTINST 16000.7 (series). Boiler valves must meet ANSI Standard Class 150 or higher, be constructed of acceptable material as specified in 46 CFR 56.60 and be marked in accordance with 46 CFR 56.20-5. Bolts, studs and nuts may be in the low strength bolting category defined by ANSI B16.5(a).

(1) If the unit is low pressure *steam*, mounting inspections are recommended in accordance with 46 CFR Table 61.05-10 because of the increased risk and obvious personnel safety hazard.

(2) If the unit is low pressure *hot water* boilers, the risk is less. Enforcing mounting requirements may be unnecessary if there is routine servicing which includes valve inspection by an accepted third party or if all piping connections are threaded, making mountings removed/studs examined not applicable. The scope of mounting inspection on a *hot water* boiler should be at the discretion of the attending MI for cause.

- e. **Automatic Controls:** Low pressure steam or hot water boilers are required to have automatic controls. If a unit is deficient in this area, it should be taken out of service until the OCMI determines appropriate compliance to 46 CFR Subchapter F. 46 CFR 63.10-1 requires a boiler manufacturer to list each control and safety device prior to installation. This should be accompanied with

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

a description of the operational tests to be performed and a certification report. The test procedures and certification report should be used as a guide for checking safety shutdowns and controls as prescribed in 46 CFR 61.35.

- f. **Documentation:** These units are pressure vessels, so should be listed on the vessel's COI and entered into MISLE to ensure regular inspection. OCMI's should vet third party service providers, either by observation or other practical means, prior to accepting their reports in lieu of inspection. Experience, certification and training are all methods an OCMI should consider. It is also recommended that OCMI's identify accepted third party service providers in writing so a record is made. Periodic review of service providers work and/or credentials should also be considered.

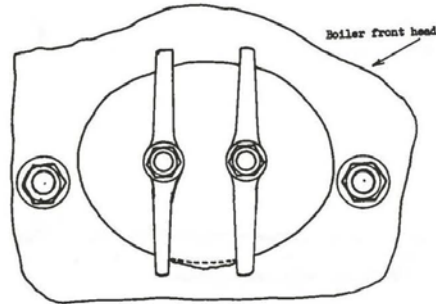

Retention of equipment specifications and model numbers is highly recommended to ensure that proper servicing, repair and documentation of the installation takes place.

6. Repairs to Boilers

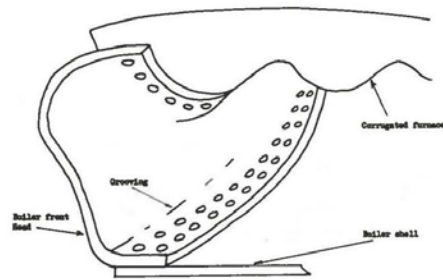

- a. It is difficult to describe all of the types of boiler repair procedures that the inspector may have to consider.
- (1) Boiler defects will seldom involve only certain specific areas. Severely pitted tubes will often be accompanied by pitting in headers or in steam and water drums. Similarly, a distorted corrugated furnace frequently is evidence of wastage of combustion chamber plates or adjoining furnaces.
- (2) All repairs must comply with the requirements of 46 CFR Part 59.
- b. **Firetube boilers.** In firetube boilers, close tube spacing limits visual inspection of the outside of the tubes is limited to the outer rows. Heavy scale buildup on these tubes is common, and thorough cleaning of the tubes **may necessitate** chemical cleaning. **(See figure B1-2 for examples of defect and repairs to fire tube boilers.)**
- (1) In addition to pitting on the waterside, these tubes are subject to wastage of that part of the tube that projects beyond the tube sheet, particularly in the smoke box area. This condition is easily detected. When it is found, the defective tubes should be renewed.
- (2) On the other hand, thinning of the tube walls due to corrosion can usually be discovered only by cutting out and sectioning tubes. This procedure should be followed only when a substantial number of the tubes are found to be leaking or plugged. In general, when tubes look satisfactory on the waterside, the boiler has no history of tube failure, and leakage can be corrected by rerolling, the tubes

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

may be kept in service. Tubes from which the beading has been burned off should not be built up by welding, but must be renewed.

Figure B1-2: Examples of Defect and Repairs to Fire Tube Boilers**Wastage of Scotch Boiler Front Head Below Manhole Opening**

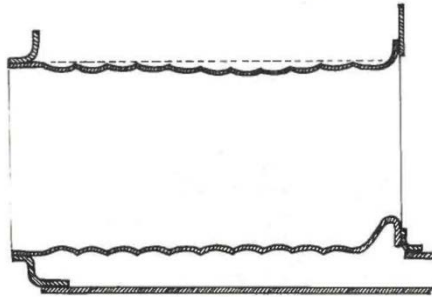

Repair consists of thorough cleaning or grinding to sound metal, magnetic particle testing to ensure no fractures exist and building up of original thickness by welding.

Grooving of Front Head Below Furnace

Grooving in this area, when it is not extensive, may be repaired by chipping out the groove to sound metal, non-destructive testing and subsequent welding. Extensive grooving, or fractures stemming from old grooving previously welded can be repaired only by cutting gout and renewing a portion of the head plating.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

Distorted Corrugated Furnace**Repair in conformity with procedure outlined in 46 CDR 59.15-1**

- c. Watertube boilers. In watertube boilers, tube replacement is one of the most frequently encountered repair procedures. Boiler tube life is influenced by such factors as original wall thickness, thermal stresses due to location within the boiler, waterside corrosion, fireside damage, and service history of the boiler. The external surfaces of tubes are exposed to loss of metal from corrosion by sulfur and vanadium in the oil burned, as well as overheating and slag damage. Deterioration of this type may result in abnormal bends, bulges, blisters, ruptures, and mechanical fatigue cracks that are fairly obvious during visual inspection of the firesides. The following procedures are recommended for inspection of boiler tubes:
- (1) Conduct a visual inspection of all uncovered tubes.
 - (a) In general, when tubes look satisfactory from a visual inspection, they may be kept in service until some degree of failure is encountered.
 - (b) When the same type of tube failure occurs often, a major tube replacement should be considered. A number of failed tubes may be plugged in an operating boiler, generally not exceeding 10 percent of the tubes in any one tube bank, section, or pass. However, this 10 percent figure is for guidance purposes only, and any recommendations for tube replacement by the manufacturer's representative should be followed.
 - (c) Tube location is important in determining whether the tubes can be plugged. Superheater tube plugging should be limited to 10 percent of each pass. Renewal of tubes at less than 10 percent may be justified if the tubes in question are in a group or may cause poor gas flow or overheating. Defective support tubes should be renewed. Defective major circulating tubes, such as downcomer or riser tubes, should be replaced.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (2) If there is a suspicion that deep corrosion produced scabs exist in waterside pits, or if any other condition prevents minimum thickness determination, chemical cleaning to bare metal should be required.
- (a) If this process shows pits in a large number of tubes, and more than one or two in many tubes, a sample tube should be cut out of the boiler and sectioned and its minimum thickness determined.
- (b) If the sample tube has deteriorated generally to less than 50 percent of the original thickness, a representative number of tubes (20-30) should be cut out of the tube bank and the process repeated.
- (c) If more than half of the sample tubes are found to be in the same general condition of deterioration, consideration should be given to retubing the boiler.

7. Inspection of Boiler Mountings

- a. Inspection of boiler mountings. The regulations concerning boiler mountings in 46 CFR 52.01-3 and 61.05-15 were written when more attachments were connected directly to the steam drum or boiler shell than in today's more modern boilers, which have welded mountings. However, the intent and concerns of these regulations apply to modern boilers regardless of mounting types.
- (1) The inspector should recognize the importance of all connections and piping to the first isolation valve. It should not be necessary to require removal of all first isolation valves to comply with the "mounting" inspection intent. All major valves, which are the first isolation or control of steam or feedwater, should be treated as "mountings" for inspection of the valve and piping toward the boiler.
- (2) At a minimum, the following valves are subject to valve and mounting inspection requirements: main steam stop, generator steam stop, auxiliary steam stop, main and auxiliary feed stop, blowdown (surface and bottom), superheater vent, superheater drain, and soot blower stop.
- b. Inspection criteria. The following inspection criteria must be observed during inspections of boiler mountings:
- (1) 5-year valve inspection. This should be adequate to ascertain the condition of the valve body, adjacent piping, and valve condition to ensure isolation of the system down from the valve.
- (2) 10-year mounting survey. This includes studs that are subject to high heat and stresses. Valves should be required to be removed if internal piping and valve

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

conditions cannot be adequately examined from inside the steam drum or other open connections.

- (3) Studs. Boiler mounting studs must be manufactured in accordance with ASME Standard 193. Studs are heat treated and marked on one end with a grade and manufacturer's symbol. A common stud grade is "B7," which indicates a heat-treated, austenitic steel alloy for "high strength" bolting materials.
- (a) Studs should be checked for proper heat number. The stud may be examined in place. If the stud is removed, it should be examined for cracks, "necking" down, or deterioration.
- (b) If studs are bend tested, experience and sound judgment is necessary to determine whether the studs are brittle. Even a new stud will break at the notch of a thread when bent more than 30 degrees. Therefore, bend testing is not recommended.
- (4) Flanged valves. When flanged valves are removed from the boiler pads for any reason, the condition of the studs or bolts that connect the valves to the pads must be determined.
- (a) When valves are bolted to pads or spools that are riveted or welded to the boiler, the riveted or welded joints should not be broken unless there is evidence of leakage or deterioration. These examinations may also be made at intermediate periods if there is any evidence that defects have developed or that excessive corrosion has occurred.
- (b) When one or more flanged joints intervene between a stop valve and the boiler drum or superheater outlet, such flanged joints need not be opened at the time the valve is removed from its flanged joint. An inspector may open a flanged joint at any time if the inspector considers examination to be necessary.
- c. Removal of mountings and attachments on high-pressure boilers. The requirement to remove boiler mountings at 10-year intervals has been modified for certain vessels with unusually high steam pressures. This modification has been permitted due to the difficulty of attaining a steamtight joint and the fact that some valves are welded directly to the steam piping.
- (1) For these vessels, only the bonnets of the valves need be removed to permit the inspection required at 10-year intervals. Valves, mountings, and attachments need not be removed unless defects are found that require their removal for further examination, repair, or replacement.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (2) Credit must be given for an **10-year** boiler mounting inspection for these vessels if the boiler valve bonnets are opened and the inspector is satisfied with the examination.
 - (3) A mirror must be used to check all inaccessible parts of the mountings.
 - (4) A record of the inspection of the mountings must be made on Inspection Book, **checklist** and a notation made on the COI. This notation must be carried on each succeeding certificate until the next inspection.
- d. **Boiler safety valves. Testing of boiler safety valves is typically conducted at the inspection for certification. Extensions are not authorized for the testing of safety valves. In most cases, the testing of these devices can be accomplished without taking the vessel out of service. Proving satisfactory operation of boiler safety valves is now especially important given the potentially increased intervals between boiler internal examinations and hydrostatic tests. The inspector shall observe the lifting and reseating pressures of the boiler safety valves and examine the valves to determine if there are any signs of weakness or malfunctioning. Whenever evidence of leakage appears, the inspector may require the safety valves to be opened at intermediate periods for examination. The inspector shall carefully check the setting of each boiler drum and superheater safety valve and require any adjustments necessary to maintain the boiler within MAWP.**
- (1) **The inspector shall observe that boiler safety valves are installed correctly and operate satisfactorily. These valves shall be tested to determine if they can prevent the build-up of excessive pressure. Verification of the safety valve settings shall be checked at each inspection and adjusted if necessary.² Guidance on in service setting of safety valves is in NVIC 1-71 Para. 5.c. and 5.d., ASME Section 1 PG-72.3 and Marine Safety Manual, Volume IV – Technical, COMDTINST M16000.9 (series) are applicable.**
 - (2) **Inspection of piping. The safety valve escape piping shall be examined for freedom of expansion and proper drainage. At the time the safety valves are tested, the inspector shall also ascertain that the drain opening in the valve body and the escape piping are free. Improper drainage or plugged drains may result in serious corrosion of the valve body and internal parts. The inspector shall examine the boiler casings to ascertain that there is no accumulation of soot, ash, or scale that may drop into the escape piping and cause malfunctioning of the safety valve. The inspector may require the discharge connections to be removed to determine the freedom of discharge from the safety valves.**

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

²NOTE: ABS Rules allow safety valves to exceed the boiler MAWP. This should not be allowed in accordance with 46 CFR 52.01-120(a)(6).

- e. Cast-iron valves, water columns, test clocks, and gauges. The inspector must carefully examine water columns and gauge glasses at each annual inspection.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (1) The inspector must ascertain that water cannot accumulate in the pipe forming the steam connection to the water column. The connections to the boiler should be free, as indicated by the action of the water in the glass.
- (2) The water columns and gauge glasses must be blown down on each boiler to determine the freedom of the connections to the boiler and to see that the blow off piping from the water columns and gauge glasses is free.
- (3) The operating condition of the gauge cocks must be determined by test.
- (4) All steam gauges on the boilers and main steam lines must be checked for accuracy.

8. Inspection Procedures for Externally Fired Lap Seam Boilers

- a. Before inspections. Before inspection, all lagging or other material covering longitudinal lap joints must be removed on the entire length of the seam to a width of at least 4 inches from the nearest course of rivets, after which the seam must be thoroughly scaled and wire brushed outside (and inside if possible).
 - (1) All deposits of electric welding, whether on rivets or plates, must be entirely removed.
 - (2) The joints must then be thoroughly examined for indications of grooving or other defects.
 - (a) Grooving in the initial stages is characterized by a line of irregular surface cracks extending along the caulking edges or running parallel with the line of rivets, and is particularly noticeable on the waterside.
 - (b) When grooving is evident, steps should be taken to ascertain its depth and extent so that a lower working pressure may be calculated, based on the premise that the groove exceeds the maximum measurable depth by 10 percent.
- b. During inspections. During inspection, and while the boilers are under full hydrostatic stress, the exposed seams must be shock tested over their entire length by striking the plates in the vicinity of the rivets with a smooth-headed hammer weighing at least 7 pounds. Should this procedure reveal a leak, however slight, in the solid plate, it means there is a crack. In this case, the lap seam must be cut away and butt straps installed or the shell plate renewed.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- c. Fusion welding. Fusion welding for any purpose or to any degree must not be applied or allowed to remain on rivets or solid plate forming a longitudinal lap joint. Should leaks develop as a result of slack seams or rivets, a sufficient number of rivets must be renewed in order to obtain a tightly caulked joint.
- (1) Rivet removals, when necessary, should be accomplished by chipping off the rivet points (heads) and driving out the shank, but never by burning.
 - (2) In every case where rivets are removed, appropriate nondestructive testing should be used to detect the presence of cracks. Seams found to be satisfactory may be relagged or otherwise covered so that the covering can be easily removed intact at subsequent inspections.
- d. Reports of defective seams. Commandant (CG-CVC) must be provided with a detailed report, including photographs, if obtainable, in each case where defective seams are detected.
- e. Alternative repair methods. Should a departure from these methods of repair become necessary, full details must be transmitted to Commandant (CG-CVC) for approval before alternative action is taken. A separate entry must be made on Inspection Checklist, CG-840 in each such case, indicating that the foregoing procedures have been carried out. A statement of the conditions found and the nature and extent of repairs, if any, must be included.
-

9. Lessons Learned About Boiler Operation

- a. Explosions in firetube boilers. Facts discovered during the CAPT C. MATHIASSEN investigation indicated that a weakened condition of the flanged plate, forming part of the combustion chamber, escaped detection during the annual inspection.
- b. It is evident that hydrostatic and hammer tests alone are not sufficient to establish the integrity of a boiler for continued service. Defects that show up under hydrostatic tests can easily be observed from the outside or fireside of conventional boilers. Often, however, the most serious defects are indicated only by the surface condition of the plates or other parts seen from the waterside or steamside. Some of these interior defects are:
- (1) Grooving, which is usually found along the edge of lapped plates and **fatigue cracking on the knuckles of flanged plates and** on the underside of the first corrugation forming the horse collar of Morison-type furnaces; and
 - (2) General deterioration of plates and stays caused by corrosion, which is often concealed by a thick layer of scale.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (3) **The extent to which these defects have advanced can be determined only through most careful examination after the boiler has been thoroughly scaled and cleaned.**
-

10. Superheater Erosion

- a. Inspection procedures. When inspecting boilers that have superheater headers installed vertically or nearly vertically, the inspector must use all means available to determine if there is grooving or pitting of the header in the area of the baffle. This examination should include the use of mirrors and finger touch, as necessary.
- (1) If serious pitting or erosion is found in such superheater headers, the drain holes should be relocated in the baffle near the center thereof and the original holes welded closed.
 - (2) Whenever pitting or erosion is noted, necessary repairs should be made to prevent a potential boiler casualty.
- b. Cast-iron and malleable iron valves. Failures of cast-iron boiler valves used in main and auxiliary steam feed and blow off lines installed prior to 1 July 1935 have resulted in a number of serious casualties and deaths.
- (1) Because of the thinning down of the valve bodies due to corrosion and wear, with a consequent decrease in the factor of safety, cast-iron valves and fittings used in boiler mountings and in steam feed and blow off lines should be subjected to thorough examination, particularly at the time of the annual inspection. Since the brittle properties of cast iron may produce fractures under conditions of shock and sudden applications of load, such as "water hammer" and rapid changes in temperature, cast-iron valves and fittings should be carefully and thoroughly examined for cracks and corrosion defects at the time of inspection.
 - (2) At the end of the 5-year period when boiler mountings are opened and the end of the 10-year period when they are removed, in accordance with 46 CFR 61.05-15, cast-iron valves and fittings should be subjected to a thorough visual inspection, both internally and externally.
 - (a) The valve bodies should be inspected to ascertain whether there has been a reduction in wall thickness below the requirements specified in 46 CFR 56.60-10. If the thickness of the material has fallen below the specifications, such valves and fittings should be removed from service.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (b) Special consideration should be given to installations in which cast-iron valves and fittings have been repaired or have had parts replaced or altered. The bodies of cast-iron valves and fittings should not be tapped for drainage or bypass connections, etc., except when a boss has been cast integral with the valve.
 - (c) Because cast iron and Grade B malleable iron have somewhat similar properties, valves of this latter material should receive the same thorough inspection as required for cast iron.
- c. Steam piping to soot blowers. In one reported casualty, a 600 psi steam supply line to the soot blower elements ruptured, causing serious injuries to the person who was blowing tubes. Examination of the ruptured pipe showed that the rupture occurred in a bend where erosion had, over a period of years, virtually eaten away the pipe from the inside. During periodic inspections, particular attention must be given to areas where erosion or corrosion is likely to occur in soot blower piping. The location of these areas can best be determined from a visual examination of the piping installations aboard the vessel.

H. INSPECTION OF AUXILIARY MACHINERY AND EQUIPMENT

The purpose of tests and examination of auxiliary equipment is the same as for main equipment. Inspectors need to ensure that auxiliary equipment will operate safely at the design pressure, temperature and condition for a specified minimum period of time.

1. Turbine Driven and Diesel Driven Auxiliary Machinery

- a. Overspeed trips, low-lube oil pressure trips, and low-lube oil pressure alarms on turbines or diesel driven auxiliary generators should be tested at each inspection. Any operational tests of lube oil shutdown controls should not risk shutting off the oil supply to bearings. Other turbine driven auxiliary machinery, such as 'steam' driven feedwater pumps and fire pumps, require examination under operating conditions. This is to ensure proper functioning of the local and remote startups as well as shutdown and speed controls while under various load conditions.**

2. Steam Driven Feedwater Pumps

- a. A manufacturer of feedwater pumps, Coffin, issued a letter in the 1980's recommending against operational tests of the overspeed shutdowns because it introduces conditions which may result in damage to the water end of the pump. Coffin suggested an alternative, which was to send the O/S tripping mechanism to their repair facility in conjunction with the five year ABS survey of the pump. To**

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

verify the conditions of the pumps, Coffin checks the overspeed mechanism by measuring the tension of the spring and accuracy of the weight on the trip then issues a letter certifying that the pump will trip at the required speed. However, this is only done upon the request of the operator.

b. The overspeed shutdown on a steam driven feedwater pump is a safety device and its proper operation needs to be confirmed. Depending on the feedwater system type, a minimum number of operable feedwater pumps are required and should be tested each inspection in accordance with 46 CFR 56.50-30. Duplication of these pumps is required so that the loss of one feedwater pump doesn't cause the loss of water being fed to the boilers. Loss of feedwater to the boilers due to pump failures results in a loss of propulsion casualty because there is no means to generate steam. There are several options to verify the proper operation of overspeed controls on steam driven feedwater pumps. Regardless of the test method marine inspectors should give operators pre-inspection notification of the intent to test these pumps. The identified test methods are:

- (1) At a minimum, the manual or 'hand' trip on the pump should be tested annually. This test will verify the functionality of the overspeed linkage and steam shutoff valve. However, this test does not verify the overspeed mechanism is set to the proper tripping point. This test should be done with the pump running. If the manual trip does not work, then the entire overspeed mechanism needs to be restored to an operational condition or replaced prior to the ship's departure.
- (2) Another options is for the ship's crew to operationally test the pump overspeed trip. This requires the crew to be knowledgeable with the procedure for testing the trip. A turbine shaft extension must be installed to the pump's turbine to accommodate a tachometer. If the shaft extension is not available or if the crew is not familiar with its necessity, the inspector should consider another method of testing. In addition, the crew must have the overspeed tripping RPM for the pump available. This is typically found in the pump manufacturer's manual.
- (3) If the marine inspector is not satisfied with the crew's capabilities, arrangements can be made for a manufacturer's technical representative to attend the vessel and test the pumps. Some pump manufacturers prefer this over the crew testing the shutdown to avoid turbine casualties.
- (4) As previously mentioned, the manufacturer can also certify the tripping mechanism's spring is set to overspeed at the proper tripping RPM. This typically requires bench testing of the spring and can cause lengthy delays due to removal of the tripping mechanism from the ship. Having the manufacturer certify the tripping mechanism may be the safest method of ensuring the proper operation of the safety device.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

NOTE: Not all feedwater or fire pumps are steam driven. If pumps are electrically driven they require no overspeed testing. If the crew is unfamiliar with 'steam' driven feedwater pump testing, consultation with the pump manufacturer should be considered due to potential safety hazards that can result in failed turbine casings and turbine blade debris.

3. Other Vital Steam Auxiliaries

- a. **The marine inspector shall determine the following pumps are operable and are provided in duplicate prior to sailing. The Vessel/Facility Inspection Requirements, Form CG-835 shall be written for inoperable or lack of duplication of the following pumps because they are necessary to prevent loss of power casualties;**

- (1) Boiler Feedwater Pumps; 46 CFR 56.50-30(a)**
- (2) Condensate Pumps; 56.50-35**
- (3) Fuel Oil Service and Transfer Pumps; 56.50-65(b)**
- (4) Lube Oil Service Pumps; 56.50-80(b)**
- (5) Main Seawater Pumps (for condenser cooling); 56.50-45(a).**

4. Steering Gear

See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter C4 for guidance on inspections of steering gear.

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**I. INSPECTION OF PIPING SYSTEMS**

1. General Considerations

The inspector should be generally guided by 46 CFR Subchapter F and ANSI B31.1 for the inspection of piping systems. The inspector should pay particular attention to material type and rating, pipe securing arrangements, couplings, and alignment. The material and equipment must be suitable for the service intended and meet melting point, ductility, strength, and compatibility requirements for the system. Piping must be well secured to reduce vibration and stresses. Couplings must be suitable for the pressure and service. Proper alignment of piping systems should also be checked. See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapters B3 and C2 for information regarding expansion joint and dresser coupling requirements.

2. Test and Examination Intervals

The hydrostatic test interval for firetube boilers' main steam piping must be in accordance with the intervals permitted in Paragraph G.2 of this Chapter. The hydrostatic test interval for watertube boilers' main steam piping must be in accordance with the intervals permitted in G.3 of this chapter. Hydrostatic testing of steam piping subject to main boiler pressure, other than main steam piping **with a nominal size of more than 3 inches should be subjected to a hydrostatic test at a pressure of 1 ¼ times the maximum allowable working pressure of the boiler after every five years of service.**

3. Pressure Relieving Devices

The marine inspector shall observe that pressure relieving devices operate satisfactorily. Verification of proper installation for the intended service is a necessary safety precaution. Recent field observations indicated that some relief valves were removed and blanked off when systems required them. Often relief valves are removed after they fail and no suitable replacement is available while vessels are underway.

Field observations also indicate that some vapor relief valves have been installed on liquid piping (or liquid relief valves installed on vapor piping) which is a safety concern. Marine inspectors can verify if valves are installed for proper service, whether liquid or vapor, by checking ship-piping diagrams. Liquid relief valves generally have the spring enclosed and do not have lifting gear. Liquid valves also have a cap on the top and the pressure adjusting nut is under the cap. Marine inspectors can also verify the relief valves by checking their nametags.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

Marine inspectors should observe bench or operational testing with a calibrated pressure gauge to ensure pressure relief devices open at proper pressure. Details on testing and setting relief valves can be found in Marine Safety Manual, Volume IV-Technical, COMSINST M16000.9 (series), Chapter 3. Relief valves should be installed where the ship's equipment manuals and piping diagrams indicate. The following are systems/equipment that marine inspectors should verify against ship's equipment manuals;

- a. Low pressure side of reducing stations,¹ 46 CFR 56.07-10(b)
- b. Unfired pressure vessels,² 46 CFR 61.10-5 (i)(1) and (2)
- c. All evaporators and heat exchangers, 46 CFR 54.15-15
- d. Discharge side of all fuel oil service pumps, 46 CFR 56.50-65(c)
- e. Liquefied petroleum gases for cooking and heating, 46 CFR 58.16-15 and 58.16-16
- f. Refrigeration machinery, 46 CFR 58.20-10 and 58.20-20

¹NOTE: Reducing stations should also have pressure gauges on the low pressure side in accordance with 46 CFR 56.50-10.

²NOTE: Relief valves are required on Direct Contact (DC) heaters and de-aerating (DA) tanks on steam or feedwater systems. These and all other inspected pressure vessels should be indicated on the vessel's Certificate of Inspection in accordance with 46 CFR 61.10-5.

4. Internal Bilge Suction Valves

- a. Internal valves are required to be installed on bilge suction lines on passenger vessels by 46 CFR 56.50-50. They are not required on cargo or tank vessels, but are fitted, in many instances, as an additional safety measure.
 - (1) These valves often consist of screw-down valves that, in many instances, become frozen in the open position. In some collisions and groundings, damage to the vessels could have been greatly reduced if the proper precautions and maintenance had been taken with internal valves. Often, the initial damage was confined to one watertight compartment but because internal valves had been left open, other compartments were flooded, cargo holds were damaged, and personnel were endangered.
 - (2) In the course of some investigations, it was reported that no officers knew the purpose of the valves, or even that they existed.
 - (3) The inspector must check such valves and require them to be operable, whether or not the valves are required under 46 CFR 56.50-50. The inspector must also ensure that the ship's officers understand the purpose of these valves.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- b. **Neutralizing valves or incapacitating remotely operated valves.** Should the operator of a cargo vessel equipped with remote control suction valves in bilge suction lines wish to remove these valves or render them permanently inoperable in the open position, the following are examples of acceptable procedures:
- (1) Removing the remote control rod, operating wheel, and suction valve and replacing the valve with a spacer of equivalent size.
 - (2) Removing the remote control rod, operating wheel, remote control suction valve bonnet, valve disc, body seat ring, and guide bridges and replacing the valve bonnet with a steel cover plate of appropriate size.
 - (3) Removing the remote control rod, valve stem, and disc and installing a screwed plug or bolted gasket and washer over the stuffing box hole to create a tight valve bonnet.

5. Cargo and Vital or Critical System Piping Repairs

Repairs to cargo and vital or critical system piping systems are classified as emergency, temporary, or permanent in nature. Emergency repairs are made to permit the completion of cargo discharge. Temporary or permanent repairs must be required prior to loading of another cargo. Temporary repairs may be acceptable for isolated defects in otherwise good piping; such as a pit. Temporary repair methods include the use of substantial pipe clamps, repair sleeves, and similar devices capable of withstanding operating pressures and temperatures. Permanent repairs are made by an isolated welded doubler or renewal in kind, and are required upon the next gas-freeing or repair period, whichever is sooner. Generally, piping with a localized, isolated defect and otherwise in good condition may be repaired permanently with a doubler.

Policy continues on B1-52.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

NOTE: Piping restored to service by any of these methods should be appropriately tested upon completion of repairs.

6. Fuel Piping Systems

Fuel supply and service piping, including piping provided by engine manufacturers, should be carefully inspected. Fires have resulted from the cracking of fuel supply lines and injector couplings due to vibration. All fuel systems should be checked for proper mounting, expansion joints, filter arrangements and spray shields.

J. ELECTRICAL INSPECTIONS

1. Introduction

At each inspection for certification, the inspector must examine the vessel's electrical equipment and apparatus, the arrangement and materials of the installation, and the operating condition of the installation as required by the regulations. The main purpose of electrical inspections is to ensure the adequacy and reliability of shipboard electrical systems, to improve personnel safety by minimizing electrical shock hazards, and to minimize the danger of fire originating within the electrical system.

2. Scope of Inspection

The scope of the electrical inspection is detailed in 46 CFR 176.806 for small passenger vessels and in 46 CFR 110.30 for other vessels. The inspection includes the examination and testing of electric generators, motors, wiring circuits, junction boxes, fixtures, and other electric installations. No electrical repairs or alterations affecting the safety of the vessel, its equipment, and crew may be made without the knowledge and approval of the OCMI. Drawings must be approved before work is started when the repairs will involve alterations. See MSM Volume II, Material Inspection, COMDTINST M1600.7A (series), Chapter A4 for more information concerning the inspection of electrical equipment used on vessels.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

3. General Applicability and References

The standards for the inspection of electrical installations on all vessels except small passenger vessels are contained in 46 CFR Subchapter J. As indicated in 46 CFR 110.10, these regulations are supplemented by recognized specifications, standards, and codes. 46 CFR Subchapter J applies to small passenger vessels only insofar as they are made applicable by 46 CFR Part 183. Vessels contracted for prior to November 19, 1952, are not fully subject to the requirements in 46 CFR Subchapter J. The electrical installations on these older vessels may be maintained as long as their condition is satisfactory to the OCMI, unless amended regulations specifically apply to these vessels. However, major alterations or extensions to such electrical installations must be made according to the requirements of 46 CFR Subchapter J. Additional reference material can be found in the Institute of Electrical and Electronic Engineering (IEEE), American Society for Testing and Materials (ASTM), American National Standards Institute (ANSI), National Electric Code (NEC), International Electrotechnical Commission (IEC), the old 46 CFR Subchapter J (pre-June 1996 editions), NVIC 2-89 Guide for Electrical Installations on Merchant Vessels and MODUs, NVIC 9-84 Electrical Installations in Agricultural Dust Locations, and Underwriters Laboratory Inc. (UL) Publications.

4. Initial Electrical Inspections

- a. When carrying out tests and inspections prescribed in 46 CFR 110.30, the inspector must pay particular attention to the items detailed in the following paragraphs. These tests and inspections should be completed at the discretion of the marine inspector and/or the OCMI.
 - (1) Extreme caution must be exercised during all inspections and tests. Inspections and tests will be conducted by the shipbuilder, the owner, or the owner's representative and observed by an inspector. Test and inspection data must be recorded and obtained for checking and reference purposes.
 - (2) For more detailed plan approval information, see MSM Volume IV, Technical, COMDTINST M16000.9 (series).
- b. Electrical cable. Electrical cable must be checked during installation for size and type as shown on the approved plans. The adequacy of cable supports must also be checked.
 - (1) Cables should not be located near pipes and hot objects, and they should not have been damaged during installation by excessive pulling, sharp bends, sharp or rough edges of cable supports or bulkhead penetrations, or similar conditions.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (2) Cable penetrations required to be watertight should be checked for proper packing of terminal or stuffing tubes, including areas provided for future take-up of gland units.
 - (3) Cable penetrations through Class A and Class B bulkheads and decks should be checked for compliance with approved methods.
- c. Insulation resistance. All electric power and lighting cables, generators, and vital systems motors must be checked for proper insulation to ground and between conductors.
- (1) The insulation resistance measuring instrument (megger) used should be of the 500 volt, direct-current type, except for equipment where the normal operating voltage is less than 100 volts, in which case a direct reading ohmmeter of the appropriate voltage should be used.
 - (2) Insulation resistance varies considerably with humidity, amount of exposed copper, etc. Therefore, it is difficult to establish firm rules to guide the inspector. Generally, Figure B1-4 should be used as a guide in determining minimum acceptable values of insulation resistance. Ordinarily, on a dry day and with new, clean equipment, resistance should not be less than the values indicated in the figure. The insulation resistance in megohms must be at least equal to that determined by the formula in Figure 6-4.
- d. Group control panels. When two or more motor controllers are grouped into a central panel and supplied by a common feeder, the panel must be checked for compliance with the requirements of 46 CFR 111.70.
- (1) Each controller, its associated motor overcurrent protective device, its motor branch circuit overcurrent protective device, and disconnecting mechanism must be mounted in a common enclosure with a disconnect device that prevents the door from being opened when the circuit is energized. The enclosure must be either drip-proof or watertight, depending on its location.
 - (2) Adequate working space should also be provided. This generally should be no less than 76 cm (30 in) in front of the enclosure and in no case less than 18 inches in the rear when access to the rear may be necessary.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

**FIGURE B1-4
INSULATION RESISTANCE**

GENERAL INSULATION RESISTANCE FORMULA FOR VITAL MOTORS AND
GENERATORS

$$R \text{ (In Megohms)} = \frac{E}{KVA + 1,000}$$

$$100$$

$$100$$

Where: E = Rated line to line voltage of the machine.

KVA = Rated kilovolt amperes.

GENERAL RESISTANCE TABLE FOR CABLE1

MINIMUM CIRCUIT	INSULATION RESISTANCE
0 – 5 amperes, inclusive	2.0 megohms
6 – 10 amperes, inclusive	1.0 megohms
11 – 25 amperes, inclusive	400,000 ohms
26 – 50 amperes, inclusive	250,000 ohms
51 – 100 amperes, inclusive	100,000 ohms
101 – 200 amperes, inclusive	50,000 ohms
Over 200 amperes	25,000 ohms
The values for a circuit should be determined with the circuit de-energized, with all switches or circuit breakers connected in the circuit closed, and with all panelboards, controllers, fuses, and fuseholders in place.	

- e. Generators. Generators must be checked for general condition (both electrical and mechanical), voltage regulation, parallel operation, operation of safety devices such as reverse-current or reverse-power trips, overcurrent trips, overspeed trips, low-oil pressure trips, and similar devices (see 46 CFR 111.12).
- f. Rotating electric machinery. Rotating electric machinery must be checked to ensure that rotating and uninsulated electric parts are adequately shielded from accidental contact by personnel. Nameplate data must be examined for correct ratings for the particular application (see 46 CFR 111.01 and 111.25).

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- g. Switchboards. Switchboards must be checked for nonconducting handrails, guardrails, working spaces, insulating floor coverings, drip covers, and shields.
- (1) Switchboard enclosures must be checked for proper construction in accordance with 46 CFR 111.30.
 - (2) Switchboard mounted apparatus must be checked for identifying nameplates.
 - (3) Circuit nameplates must be compared with the rating or setting of the overcurrent devices and with approved plans.
 - (4) The accessibility of items requiring maintenance or adjustment must be checked.
 - (5) Meters must be checked for proper operation.
 - (6) The operation of automatic switchgear and interlocks must be observed (see 46 CFR 111.30).
- h. Panelboards. The rating or setting of the overcurrent devices must be compared with the values given on the circuit directory and the approved plans. The accuracy of the directory description of loads served by each circuit must also be checked (see 46 CFR 111.40).
- i. Motor starters. Motor starters must be checked to ensure proper starting under service conditions with properly rated motor overload protective devices.
- (1) Enclosures must be checked to ensure that they are drip-proof or watertight and that required door positioners are installed on doors with a height of more than 45 inches or a width greater than 24 inches.
 - (2) A fixed heat-resistant wiring diagram for each motor starter must be on the inside of its enclosure door.
 - (3) Each motor starter not disconnected from all sources of potential when the disconnect switch is opened, due to electrically interlocked circuits that are necessary for proper operation of the apparatus or for other valid reasons, must have a warning sign directing attention to these conditions (see 46 CFR 111.70).

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- j. Disconnect switches. The presence and location of disconnect switches required for motor starters, fuses, etc., must be checked. When a switch or circuit breaker is intended to serve as a motor and controller disconnect switch, the inspector must ensure that the applicable requirements have been met (see 46 CFR 111.55 and 111.70 and National Electrical Code Article 430, Part H).
- k. Accessibility. The inspector must observe the accessibility of electrical apparatus for inspection and maintenance.
 - (1) The inspector must also note the accessibility of junction boxes and similar apparatus in way of paneling.
 - (2) The inspector must check hinged doors of motor starters and similar apparatus for interference with adjacent structural parts or apparatus.
- l. General alarm systems. The inspector must check the general alarm system with a sound level meter and measure the sound level of the bells in each stateroom with the doors closed. Where the background noise level is questionable, the sound level should be measured while the vessel is underway (see 46 CFR 113.25-9).
- m. Electric installations in hazardous locations. During the initial inspection for certification, the inspector must check the emergency loudspeaker system with a sound level meter at each lifeboat handling station, each lifeboat embarkation station, each passenger assembly station, and throughout the crew's quarters. Where the background noise level is questionable, the sound level should be measured while the vessel is underway or the required sound levels.
- n. Emergency loudspeaker systems. The inspector must check electric equipment and wiring in hazardous locations for compliance with 46 CFR 111.105.
 - (1) Intrinsically safe systems must be checked to ensure that they are installed in accordance with the plans and instructions required by 46 CFR 111.105-11.
 - (2) Equipment required to be explosion-proof or intrinsically safe must also be checked for proper Underwriters Laboratories, Inc. (UL), Factory Mutual Research Corporation (FM), Canadian Standards Association (CSA), or MET Electrical Testing Company (MET) labels.
- o. Steering gear circuits. Steering gear circuits must be separated. Steering gear motor controllers must be located in the steering gear room.
- p. Emergency firepump circuits. Circuits for emergency firepumps must not pass through the engine room or boiler room.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- q. Low voltage release tests. The inspector must determine that motor controllers have low voltage release and that motor controllers prohibited from having low voltage release have low voltage protection.
- (1) All motors should be run simultaneously and all generators then tripped off the line. One generator should be placed back on the line; it should not trip because of the oncoming load.
 - (2) Motor controllers requiring low voltage release should re-start their motors automatically; those prohibited from having low voltage release should not re-start their motors automatically. If the motor load exceeds the total ship's service generating capacity, this test should be conducted with all motors that have low voltage release and sufficient motors with low voltage protection, adding up to the total generating capacity running.
 - (3) A second test must then be conducted with the remaining motors; none of the motors in this second test should start automatically.

5. Equipment

- a. Miscellaneous electrical. The Coast Guard no longer grants type approvals for miscellaneous electrical equipment. Electrical equipment can be divided into the following categories, although some equipment approvals may require a combination of categories:
- (1) Required to be approved. Equipment that is required to be approved is listed in 46 CFR Subchapter Q and will have an approval number assigned.
 - (2) Required to meet various standards. Equipment that is required to meet various standards is discussed in 46 CFR Subchapter J. It is important to note that the requirement is to meet the standard, not to be listed by a listing service. The burden of proof that the standard is met rests with the manufacturer.
 - (3) Having specific requirements in 46 CFR Subchapter J. The index following Subchapter J may be used to identify if certain equipment must satisfy additional 46 CFR requirements.
 - (4) Required to be explosion-proof or intrinsically safe. Equipment required to be explosion-proof or intrinsically safe must be listed by UL, FM, MET, or CSA.
- b. Use of miniature thermal overcurrent circuit breakers on small passenger vessels. In 1997, Commandant (G-MSE-3) concurred based on supporting

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

documentation from MSO New Orleans that the “new” standard noted in the CFR is excessive,

and the use of miniature thermal overcurrent circuit breakers on small passenger vessels is acceptable for low voltage DC circuits less than 50 Volts, provided:

- (1) Circuit breakers may meet UL 489, or
- (2) Circuit breakers may meet UL 1077, Supplementary Protectors for use in electrical equipment, if:
 - i. an NRTL has verified that they meet UL 1077;
 - ii. they are installed in a panelboard; and
 - iii. there is at least one UL-listed fuse or UL 489 certified breaker protecting the main feeder to the panelboard to provide primary branch circuit protection.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

Policy continues on B1-59.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

6. Subsequent Electrical Inspections

- a. In subsequent tests and inspections, inspectors must pay particular attention to the items listed in this section of the manual. The inspector must determine mechanical and electrical conditions, performance, safety of personnel against shock hazards, and safety of the vessel from fire hazards.
- b. New and modified circuits. The inspector must give special attention to circuits and equipment added or modified since the last inspection to determine that they comply with the regulations.
- c. Navigation lights. The inspector must examine navigation lights for corrosion of materials and for satisfactory condition of portable cable and receptacles. Navigation light panels must be tested for satisfactory operation and proper functioning of alarms.
- d. Lifeboat winch electrical equipment. All enclosures for electrical lifeboat winch control equipment, such as limit switches, master switches, and emergency disconnect switches, must be opened and examined for evidence of water or corrosion.
 - (1) In particular, the inspector must pay attention to the proper functioning of limit switches and emergency disconnect switches in the control circuits of lifeboat winches. Casualty investigations have indicated the need to specifically examine the clutch interlock switches on dual winches, such as those on Victory-type cargo ships.
 - (2) It is essential that satisfactory limit switches and emergency disconnect switches be used with gravity davits and power-operated winches. Therefore, a test operation of the lifeboat winch controls, including limit switches, emergency disconnects, and clutch interlocks where employed, must be conducted at each annual inspection.
- e. Watertight doors. The inspector must thoroughly check the watertight door systems to verify that they are in satisfactory operating condition.
 - (1) The enclosures for all local control door switches and controllers should be examined for evidence of water or corrosion. It has been found that seawater entering the local control switch located at the watertight door may cause faulty operation of electrically operated watertight doors. If seawater has entered the switch enclosure, it may short circuit the motor starter and motor so that the door opens even with the wheelhouse control indicating the closed position.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

(2) To the extent practical, the inspector must also be satisfied that the ship's personnel are familiar with the watertight door system, location of disconnect switches, etc.

- f. Electrical cables. The inspector must determine condition of cables by insulation resistance readings and by visual observations. Deterioration of the armor of a cable that is otherwise in good condition is not considered sufficient cause for requiring replacement.
- g. Ground detection systems. Ground detection systems should function properly. Where lamps are used, they should be of the proper wattage with the connections between the lamps grounded. Ground faults must be cleared.
- h. Temporary wiring and installations. Long extension cords, jury-rigs, or temporary modifications are not satisfactory installations.
- i. Portable electric equipment. New and replacement items must meet the Coast Guard requirements. Existing equipment must be serviceable and free from potential shock or fire hazards.

- (1) Metal bodies of these items must be grounded through grounding leads in the portable cord. To be effective, the grounding conductor on a tool or light must be connected to a grounding terminal. This conductor must be electrically continuous (the wire should not be broken anywhere along its length); this can be checked with an ohmmeter or megger.
- (2) For portable devices made entirely of nonconducting material, or so constructed that dead metal parts will not become energized under any condition (double insulated construction), the grounding conductor in the portable cord and the grounding pole of the attachment plug need not be furnished. No splices or patching should be permitted in portable leads smaller than No. 12 American Wire Gauge (AWG). Splices must be in accordance with 46 CFR 111.60-19.
- (3) Careful checks must be made of the condition of the cord where it enters the light or tool. This is a location of severe stress and bending fatigue, especially on items such as portable cargo lights. Cracking, brittleness, and heat discoloration of the cord at this point are sufficient reasons for rejection. If the device is to be rewired, only cords indicated in 46 CFR 111.60-13 for hard or extra-hard service should be used.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (4) Lighting fixtures should be examined to see that the interior insulation is satisfactory, particularly the lamp holder. Cracked porcelain or plastic lamp holders should be replaced. Devices in which the exterior case is cracked or damaged should be replaced or repaired.
- j. Fire and smoke detection systems. Fire and smoke detection systems must be checked regularly, and faulty detectors must be recalibrated or replaced. Refer to 161.002-1(b) for applicable standards of design, construction, testing, marking and installation.
- (1) Thermal detectors. Thermal detectors may be tested by replacing the guard and globe with a sheet metal shield and using a portable light as the heat source; this will not cause damage to the adjacent paintwork. The activation temperature range should be as specified in 46 CFR 161.002-11.
- (2) Photoelectric and ionization smoke detectors. Photoelectric and ionization smoke detectors may be tested by holding pink sticks or other smoke source near the detector.
- (3) Infrared detectors. Infrared detectors may be tested with a candle or other flame source. Infrared detectors often have a response delay.
- k. Vital machinery. Motors, motor starters, and control switches used with machinery vital to the safety or propulsion of the vessel must be visually examined for condition and suitable nameplate ratings. When there is evidence of deterioration, they must be opened for closer inspection.
- l. Electrical cooking equipment. Electrical cooking equipment must be maintained in good condition. There should be no evidence of grease or dirt buildup or deterioration of the equipment.

K. LEAKAGE ONTO PROPULSION CONTROL CIRCUITS, SWITCHBOARDS, ETC.

The 1974 casualty to the tank vessel TRANSHURON was caused by water spraying onto the main propulsion control area from a failed cooling water gauge nipple for the vessel's air conditioning system. In another similar casualty, water leaked onto a vessel's main switchboard from an exterior electrical junction box that had filled with water. The conduit and wire provided the path to the switchboard. These casualties demonstrate that shielding or other measures must be used to guard against accidental discharge of water onto electrical propulsion installations. All water lines must be located clear of control circuits, electrical equipment, and areas of high voltage whenever possible. Cables to switchboards, controllers, etc., should be connected so as to prevent water from entering connectors, through use of drip loops, joining cables to the bottom side of the installation, or similar methods.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

L. EMERGENCY LIGHTING AND POWER SYSTEMS**1. Introduction**

Casualty reports indicate that, in some instances, emergency diesel generators and associated equipment are not maintained in a satisfactory state of readiness for emergency use.

46 CFR 35.10-15, 78.17-45, and 97.15-30 require vessel personnel to periodically test installed emergency lighting and power systems and record the results in official logbooks. The regulations for tank vessels, passenger vessels, cargo and miscellaneous vessels, and the electrical engineering requirements require testing of emergency lighting and power installations to occur in the presence of an inspector.

Testing of a properly functioning emergency plant can be accomplished quickly, with little or no interruption of normal service. 46 CFR Table 112.05-5(a) notes which vessels required are to have an emergency source of power that meets the requirements of 46 CFR 112. Also, see NVIC 2-89 Electrical Installations on Merchant Vessels and MODUs.

2. Testing

At each inspection, and whenever emergency drills are conducted, light and power emergency systems must be tested as follows:

- a. Automatic starting and connecting power systems. Automatic starting and connecting power systems should be tested by using the test switch. When the switch is put in the test position, the following should occur in less than 45 seconds:
 - (1) The Bus-tie breaker should open.
 - (2) The power source should automatically start (if the power source is a battery, this step will be skipped).
 - (3) The required loads should be transferred to the emergency power source when the voltage reaches 85-95 percent of final value, i.e., the generator circuit breaker closes. This will happen immediately for a battery source. Upon completion of the test, loads should be transferred back to the normal source and the emergency system set up for automatic operation.
- b. Manual transfer system. For a manual transfer system, test as indicated above, except that step 2 will occur as the result of a manual action. All other functions remain automatic.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- c. Alarm relay circuits. When conducting operational tests of the emergency diesel generator for initial certification or after modifications have been made, inspectors should have the shipboard personnel conducting the test temporarily disconnect any remote alarm relay circuits. When this is done, the emergency diesel generator should continue to function. If the generator fails to operate with the remote alarm relay circuits disconnected, the inspector should issue a requirement to modify the installation to allow operation of the emergency diesel generator with these circuits disabled. At the conclusion of this test, the inspector should ensure that remote alarm circuits are properly reconnected.
- d. Alternatives. Some passenger vessels contracted for prior to 19 November 1952 may not be arranged for testing as outlined above. Tests of such vessels should be performed in a manner compatible with their arrangements.
- (1) Many older vessels have an inport or standby generator (and no emergency plant, as such). These are usually arranged to feed directly to the main switchboard, and cannot be tested in the manner outlined above.
 - (2) The testing of such standby units must be prescribed by the OCMI.

M. INSPECTION OF RADIO EQUIPMENT

1. General Practices

- a. Cooperation with the FCC. When the OCMI is notified by representatives of the Federal Communications Commission (FCC) that a vessel's radio installation contains technical deficiencies, the Safety Radiotelephony or Radiotelegraphy Certificate should be withheld until the deficiencies are corrected and the OCMI receives formal notice to that effect from the FCC.
- b. Interagency resolution of deficiencies. In cases where technical deficiencies exist in a vessel's radio installation on a vessel already in possession of a Safety Certificate, the OCMI must withdraw the certificate upon the FCC's request.
- (1) Inspectors should consult with local FCC representatives before taking action in such circumstances, and must cooperate fully with FCC inspectors to carry out the intent of these instructions.
 - (2) The COI should not be withheld or withdrawn for technical deficiencies in radio installations.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- c. The inspector should remember that the technical adequacy of the radio installation, the suitability of electrical wiring to interconnect components of the radio, and the proper maintenance and efficient operation of the equipment are determined solely by FCC inspectors.
- (1) The suitability of power leads from the main power supply to the main installation in the radio room is solely the responsibility of the Coast Guard. All electrical wiring in the radio room not connected with the radio installation itself is under the sole jurisdiction of the Coast Guard.
- (2) The amount of power and character of the supply, however, must be determined by the FCC to operate the radio installation and its auxiliary equipment properly and efficiently. The FCC will notify the OCMI of any observed inadequacies in the power supply; the OCMI must ensure that such deficiencies are corrected.
- d. See MSM Volume II, Material Inspection, M16000.7 (series), Chapter E2 regarding Safety Radiotelegraphy and Safety Radiotelephony Certificates, and MSM Volume II, Material Inspection, COMSTINST M16000.7 (series), Chapter C2 regarding portable lifeboat radio equipment.
- e. See Table 47 CFR Part 80, for general information and citations regarding FCC regulations.

2. Emergency Radio Gear

The installation of all ship's radio equipment must be approved by the Coast Guard. The inspector must be satisfied that the main and emergency radio installations are located in the superstructure of the ship, as high as is practical above the highest marked load line. The emergency installation must be provided with a source of power independent of the propulsion and main electrical systems; it must be capable of being energized rapidly and operating continuously for at least 6 hours.

NOTE: Use of the emergency radio power for other than radio equipment and emergency lights in the radio room is prohibited.

N. HAZARDS AND UNSAFE PRACTICES

1. Introduction

The following guidance is intended to promote the detection, reporting, and correction of those practices and situations that tend to cause injury or death to personnel and damage to the vessel or its cargo. Safety considerations based on good marine practice are directly

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

related to the equipment and construction to which attention is directed by the regulations, and for which separate reports are required. Obviously, a vessel with defective cargo gear, dangerous gangways or access ladders, unguarded openings in the holds, poorly lighted working spaces, or similar hazards should not be determined to be suitable for service. Traditionally, it is the duty of the vessel's officers to see that dangerous conditions are corrected immediately. Aspects of good marine practice may not always be spelled out in statutes or regulations; doing so is sometimes impractical. Practices of good seamanship and good shipkeeping will vary according to the size, design, and operating conditions of a particular vessel. However, it is of paramount importance that general safety considerations are kept in mind aboard vessels at all times. When hazardous conditions are noticed, immediate steps must be taken to keep working conditions as safe as reasonably possible.

2. Statutory Requirements

Congressional statutes regarding safety of life and property on board vessels apply at all times when a vessel is in service, whether alongside the dock, anchored, or underway. The statutes in 46 U.S.C. Chapter 33 authorize the Coast Guard to inspect ships periodically for safety purposes.

3. Responsibility of the Crew

The master and other ship's officers are responsible for maintaining safe working conditions. They are also responsible for supervising or establishing proper supervision of all employees aboard a vessel. A competent ship's officer must supervise all hazardous work. Any ship's officer who is inattentive to duty or negligent in permitting unsafe conditions or practices should be admonished. If the situation is sufficiently severe, the failure should be charged against that officer's license. The primary objectives are to improve safety and to indoctrinate ship's officers in their responsibilities. However, all persons employed aboard have a mutual responsibility to carry out established procedures for the safety of themselves and their fellow mariners.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

4. Responsibility of the Coast Guard

A marine inspector or other Coast Guard boarding officer should be alert to unsafe practices and hazardous situations when aboard an inspected or uninspected vessel for any purpose. The inspector must take proper and immediate action to have unsafe practices stopped and hazardous situations remedied. Such action will, of course, vary according to the situation. In many cases, calling the attention of the ship's officers or master to the situation will be sufficient. In certain instances, it may be necessary to issue a Vessel/Facility Inspection Requirements, Form CG-835 to cover a deficiency. Serious cases, or those in which there is disagreement over the proper course of action, should be brought to the attention of the OCMI immediately. Revocation of the vessel's COI, action against an officer's license, or submittal of a Report of Violation should be undertaken when necessary. To ensure the greatest possible degree of safety on vessels operating in their jurisdiction, an OCMI must give personal attention to reported instances of unsafe practices and hazardous situations on vessels in their zone.

5. Remedies for Hazardous Situations

- a. General practices. All exposed dangerous areas and installations must be properly protected with covers, guards, or rails.
 - (1) Regulations also specify the height and number of courses of rails on passenger and crew decks.
 - (2) There should be two avenues of escape from every area within a vessel where passengers or crew may be quartered, or where anyone may normally be employed (see 46 CFR 32.02-1, 72.10-5, 92.10-5, and 190.10-5). While it is not always possible to provide such exits from cargo holds, the means of escape provided from these should be adequate and easily accessible.
- b. Refrigerants. All refrigerants must be recognized as potentially dangerous substances and treated accordingly.
 - (1) The dangers involved in the use and transportation of dry ice and carbon dioxide as refrigerants are often overlooked. The dangers of dry ice were published, but only after a series of deaths of stevedores and crewmembers related to circumstances where dry ice was used as a refrigerant.
 - (2) Container cargo may be refrigerated by introduction of liquid nitrogen into the container, where it evaporates and thus chills the contents. Unless sufficient time elapses for complete evaporation before the container is loaded aboard ship, there is a risk of spillage of the liquid nitrogen. Since the temperature of liquid nitrogen (-320°F) cannot be withstood by ordinary ship steel, spillage can result in

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

fractures. Carbon dioxide and nitrogen can be asphyxiating when concentrated in tanks or holds.

- c. Boiler torch pots. Pots should be secured in a vertical position, not at an angle. Low flash point liquids should never be used in torch pots, and fireroom personnel should be instructed in the dangers of any highly combustible liquid having a flash point lower than that of commercial kerosene, which is used for moistening the torch.
- d. Gratings. Some machinery spaces lack gratings over the top of the main condensers to provide safe platforms for oiling the intermediate pressure links, adjusting the cutoffs, and accessing the indicator cocks. A grating with handrails over the main condenser is required to ensure the safety of engineroom personnel during the performance of their duties; its requirement comes within the intent of 46 CFR 32.01-15 and 58.01-20. (For more information, see MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter A5.)
- e. Fuel oil in bilges. At annual inspections, the inspector must examine the bilges and tank tops beneath the boilers and in any compartment in which oil burning equipment or fuel tanks are installed, to ensure that there are no accumulations of fuel oil that constitute a fire hazard.
- f. Sparks and stack fires. Sparks or stack fires can result from the heating of soot and carbon deposits in preheaters, economizers and uptakes in boilers, and in exhaust manifolds and mufflers in diesels.
 - (1) A stack fire is particularly hazardous because it can develop undetected and then materialize many hours after the machinery plant is secured, when fresh air reaches the hot carbon deposits. Some vessels have had stack fires long after the crew has departed at a shipyard or layup pier.
 - (2) As a precaution against stack fires or sparking, it is necessary to keep all uptakes and mufflers clean. This is best accomplished by efficient combustion and plant operation and attention to periodic maintenance and cleaning. Inspectors require the opening of adequate access plates to inspect thoroughly those areas where carbon may accumulate.

6. Preventing Boiler Gas Explosions (Flarebacks)

Flareback in the furnace of a watertube boiler may be caused by the ignition of gases accumulating from vaporized oil that entered the furnace improperly, or ignition of vapors that have not been purged from the furnace before the lighting off.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

The following procedures must be brought to the attention of all engineering personnel, to reduce the hazards of flarebacks:

- a. Before attempting to light off the first or additional burners, ensure that properly heated oil is available at the burner to be lighted. The recirculation line is provided for this purpose.
- b. Before installing an atomizer, ensure that it is fitted with a sprayer plate, and that the burner tip is tightly made up.
- c. Before lighting the first burner or lighting off a burner again after all have been extinguished, the forced draft fan should be run long enough, with double front damper and burner registers wide open, to ensure that the furnace is properly purged.
- d. When lighting off the first burner, always use a torch. Never attempt to light a burner from hot furnace brickwork.
- e. With the torch lit and in proper position, the last valve in the branch connection leading from the fuel oil header supply line to the burner should be slightly opened. As soon as ignition occurs, this valve should be fully opened. If ignition does not immediately occur, the burner valve should be closed and the furnace thoroughly purged. This entire operation should be repeated until ignition occurs.
- f. While a burner or burners are in service, the register door(s) should be wide open, and the oil temperature and pressure should be closely monitored. Cold oil or low oil pressure may cause the fires to die out; water in the oil may do the same. Should all burners be extinguished, the valves in the individual branch connections to the burners should be closed, the forced draft fan should be kept on, the double front damper and all burner register doors should be opened wide, and the furnace should be thoroughly purged before another attempt is made to light the burner.

7. Lighter-Aboard-Ship (LASH) Vessel Lighter Cranes

- a. The extension of lighter guides aboard Lighter-Aboard Ship (LASH) barge-handling cranes may create significant personnel safety hazards. In separate incidents, despite various safety precautions, two mariners and three longshoremen were killed while lighters were being discharged. These people were caught by the hydraulically extended lighter guides of the LASH cranes and crushed against the barges.
 - (1) Operators of LASH vessels must take corrective action in accordance with 46 CFR 92.25-15.
 - (2) No specific method of personnel protection is required. However, such action must provide a degree of safety equivalent to that afforded by—

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (a) A mechanism to provide a delay of at least 3 seconds' duration, from actuation of the lighter guide extension controller and initial movement of the guide arms; and
 - (b) A distinctive, continuously sounding alarm, to begin sounding at the delay period before guide extension. An alarm speaker must be located on each crane leg, in immediate proximity to the point(s) of danger.
- b. The lighter crane on every LASH vessel must be examined at each inspection and reinspection for certification to ensure that the hazards described above have been corrected through the installation of guards, rails, and warning devices. Plans and specifications for such installations must be reviewed by the cognizant OCMI.

8. Explosions in Diesel-Fired Boilers

A number of explosions have occurred in auxiliary boilers that burn diesel oil. Many of these explosions have occurred on dual-fuel fired boilers upon switch over from diesel to heavy oil. These vessels had common fuel piping and heater systems. When the heavy oil and heater were switched in, a slug of diesel was also heated, which altered the fuel-air mixture. Common fuel piping is prohibited because of fuel and burner nozzle tip contamination problems. An explosion can occur when the fuel-air mixture in the furnace is not properly controlled. Even very small accumulations of fuel oil in the boiler can produce explosive mixtures. Automatic control systems for diesel oil should therefore be very reliable and properly designed, operated, and maintained. At each inspection of a vessel equipped with diesel-fired boilers, the inspector must ensure that the following procedures are followed:

- a. Fuel oil shutoff valves are inspected or tested to ensure that there is no leakage.
- b. Controls to shut down the boiler due to flame failure are tested to ensure safe boiler operation.
- c. To prevent a vapor buildup from residual fuel in the furnace, no time should elapse between a furnace purge and a light off or ignition trial.
- d. Dual fueled boilers that heat a heavier oil should be examined to ensure that the piping of the lighter oil does not go through the heater.

9. Galley and Laundry Room Exhaust Ducts

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

A number of shipboard fires have originated in the exhaust ducts of galley ranges, fryers, and laundry room ventilation systems. These fires have resulted in serious damage, injury, and loss of life aboard the vessels involved. Unmaintained exhaust duct work will become saturated with cooking grease and pose a fire hazard.

Such areas have sometimes been overlooked during vessel inspections. The following procedures must be followed during biennial and mid-period inspections of U.S. vessels and during SOLAS verification examinations of foreign vessels:

- a. On all vessels--
 - (1) Remove the inspection plate from the galley exhaust duct;
 - (2) Disconnect the fusible link, if installed, and test the operation of the fire damper;
 - (3) Remove sufficient inspection plates to ensure that the duct work is clean and free of grease. Pay particular attention to long, horizontal duct runs;
 - (4) Examine all hood screens for cleanliness;
 - (5) If an extinguishing system is installed, ensure that it is in proper working condition; and
 - (6) Examine laundry room vents, ask if the company has a cleaning and maintenance program (check records – part of ISM/SMS responsibility).
 - b. On passenger vessels only, the inspector must also--
 - (1) Remove sufficient overhead panels to ensure that the galley exhaust duct is suitably insulated, in accordance with SOLAS standards and applicable U.S. regulations. Unless changes are made to the duct work, this part of the examination need be made only once; and
 - (2) Check all main and zone control valves of the sprinkler system to ensure that they are in the full open position.
-

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

10. Noise Factors in the Marine Environment

- a. Personnel on virtually any type of vessel or unit may be exposed to damaging noise.
 - (1) Noise-induced hearing loss is a slow, progressive disorder that often goes unrecognized until it has become a pronounced handicap, generally in later years.
 - (2) Related problems, such as tinnitus (ringing in the ears) can be even worse. Excessive noise poses a potential threat to vessel safety by interfering with shipboard communications and the drowning out of signals and alarms.
- b. Initial Coast Guard actions. Previously, the Coast Guard dealt with maritime noise problems generally through existing regulations on a case-by-case basis. For example, 46 CFR 72.20-5 and 92.20-5 require accommodations aboard vessels to be insulated from undue noise. Similarly, 46 CFR 32.40-15 requires tankships and manned tank barges to have crew's quarters suitable for the accommodation and protection of the crew.
- c. Establishment of standards. In November 1981, the International Maritime Organization (IMO) published a Code on Noise Levels On Board Ships, Resolution A.468(XII). The Code applies to all vessels over 1,600 GT built after publication of the Code.
 - (1) In June 1982, the Coast Guard published NVIC 12-82, Recommendations on Control of Excessive Noise. This NVIC was developed in light of the IMO Code and is considered satisfactory implementation of the Code's standards. Therefore, vessels and units meeting the NVIC's standards are considered to meet those of the IMO Code as well.
 - (2) NVIC 12-82 deals with the entire spectrum of maritime noise and recommends a broad-based program of noise control and hearing conservation. Its two major recommendations are a 24-hour noise exposure limit of 82 dB(A) for all personnel and periodic audiometric examination of all personnel exposed to noise levels above a certain low exposure level of 77 dB(A). The only limits on noise levels (as opposed to exposure levels) apply to berthing spaces, and messing spaces on vessels over 1600 GT. These limits are 75 dB(A) for existing vessels and units, and 70 dB(A) on vessels and units constructed after December 31, 1985.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- d. Inspection procedures. NVIC 12-82 is based on the expectation that the maritime industry will voluntarily implement and maintain an effective noise control program without direct Coast Guard involvement. This policy was developed with the assistance of industry and the Commandant anticipates its wide implementation.
- (1) The role of inspection personnel is primarily to promote NVIC 12-82 and to note its effects. Therefore, there should be minimal Coast Guard enforcement concerning noise control. Inspectors should be alert to excessive noise levels during inspections, and require noise measurements to be taken to quantify levels of exposure.
 - (2) If excessive noise levels are verified, inspectors should require correction of deteriorated systems that permit production of unwarranted noise or the unnecessary transmission of noise to adjacent spaces.
 - (3) Inspectors should also examine the condition of hearing protection devices and the posting of warning signs, and verify that the vessel or unit's hearing conservation program is being followed.

NOTE: Complaints alleging that crewmembers have suffered hearing loss from long-term exposure to excessive noise must not be considered as reportable marine casualties involving personal injury.

- e. Handling complaints. If a crewmember files a written complaint requesting the elimination of a specific noise hazard, the situation should be evaluated and all discrepancies corrected.
- (1) The vessel owner is responsible for taking these measures, upon the request of the OCMI. Only when the OCMI has reason to question the owner's evaluations should inspection personnel become involved in noise measurement.
 - (2) Criteria for determining whether noise levels or exposure periods are excessive should normally be those stated in NVIC 12-82, namely, the noise limits for berthing and messing spaces and the 24-hour noise exposure limit. If there is objection to the application of these criteria, the owner may suggest another recognized standard that meets or exceeds the standards of NVIC 12-82. Noise control is a complex science, requiring professional expertise to evaluate problems and develop effective remedies.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- f. Program review. NVIC 12-82 was issued to promote an industry standard, and to provide a methodology to evaluate noise in the marine environment. Over the next several years, the effectiveness and content of this policy will be reviewed. Effective program review can be obtained only through feedback from field units relating noteworthy experiences and observations of noise conditions and actions. Such reports and questions concerning NVIC 12-82 should be directed to Commandant (CG-CVC).

O. INSPECTION OF PRESSURE VESSELS (P/Vs)

1. Test and Examination Intervals

Periodic inspections of unfired pressure vessels (P/Vs) are required by 46 CFR 61.10. These regulations require P/V testing and examination to be conducted twice in 5 years. The testing and examination interval for bulk storage tanks containing refrigerated, liquefied CO₂ gas for use on board vessels as a firefighting agent should not extend beyond 10 years (120 months) from the last such test/exam. The aforesaid authorization must be exercised primarily to permit the test and examination interval to coincide with the vessel's drydocking or similar out of service availability period.

2. Purpose

Periodic examinations of P/Vs are intended to assess a P/V's condition to determine that the vessel is satisfactory to continue in service at the pressure and environment of the system for which it is being used.

3. Factors Affecting P/Vs in Service

- a. Internal. P/Vs are subject to different factors that can affect their physical conditions. Water vapor, other gases, and particulate matter can cause corrosion in P/Vs. Interior coatings can affect the thoroughness of an internal examination if they mask the condition of the covered surface. Conversely, they can give an indication of trouble if deterioration of the metal results in a change to the appearance of the coating.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- b. External. Depending on where and how the P/V is mounted, cyclic loading can be transmitted to the P/V through its saddles/support framework if the foundation is subject to movement. Vibration loads are commonly transmitted to a P/V through attached piping and rotating machinery. The motion of other machinery located in adjacent areas can transmit loads through the deck and bulkheads to a P/V. Mechanical damage can occur if heavy objects contact the P/V or any of its attached piping.

4. Inspection Descriptions

- a. Visual examinations. Accessibility to the internal surfaces is the primary consideration when conducting visual examinations. Each P/V in a system regulated under 46 CFR 58.60 that is fitted with a manhole or other inspection opening so it can be satisfactorily examined internally must be opened twice within any 5-year period, with no more than 3 years elapsing between examinations. The same applies to P/Vs stamped with the Coast Guard symbol. Each P/V must be thoroughly examined internally and externally.
- (1) No P/V need be hydrostatically tested except when a defect is found that the marine inspector believes may affect the safety of the P/V.
 - (2) If a hydrostatic test is warranted, the P/V must be tested at a pressure of 1 ½ times the maximum allowable working pressure.
 - (3) Section VIII, Part UG-46 of the ASME Code has standards for openings in P/Vs. An elliptical manhole must not be less than 11" X 15" or 10" X 16"; a round manhole must not be less than 15" in diameter. Smaller openings may be acceptable if the inspector can satisfactorily examine the internal surfaces.
 - (4) The presence of a backing strip eliminates the possibility of a visual examination of the weld and may contribute to internal corrosion as a moisture trap. The presence of a backing strip does not, however, prevent the acceptance of an otherwise satisfactory visual examination. The inspector should consider other factors, such as the P/V's service, condition, other signs of internal corrosion, age, and date of last hydrostatic test, when determining whether additional testing is warranted.
- b. What to look for. All internal surfaces should be carefully examined for evidence of fractures or indications of deterioration.
- (1) The inspector should pay special attention to the heat affected zone adjacent to all welds. All welded joints, as well as all nozzle connections and similar openings,

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

should be thoroughly examined. Problem areas of the internal surfaces include low spots where water and grit accumulate, areas adjacent to openings (particularly the drain), welds, and their heat affected zones.

- (2) Problem areas associated with the external surfaces include welded attachments, such as support webs, and areas around openings, particularly if the P/V is insulated. The external appearance of insulating materials should not be accepted as indicative of the condition of the welds or the shell and head material. If the insulation materials separate from the P/V, condensate can be trapped beneath the insulation and cause metal deterioration. The insulation should be carefully examined visually and any suspect areas should be sounded to determine the extent of separation from the P/V. These areas should have their insulation excavated back to a zone of good adhesion, the metal examined, and the insulation then repaired in accordance with the manufacturer's recommended procedures.
 - (3) There are presently no regulatory or industry requirements for insulation to be periodically removed to allow visual examination of the P/V. Areas that often suffer separation are those surrounding view ports, areas surrounding pipe connections that transmit vibration to the P/V, and any projection in the upper portion of the P/V where rain or condensation normally contact the P/V.
- c. How to look. Two critical factors of an inspection are illumination and accessibility. There must be sufficient light to allow a thorough examination of all welds and plate surfaces. Bright illumination is necessary for all visual examinations.
- (1) If access to the internal areas is limited to small "inspection openings," a flashlight beam directed through such openings may not provide sufficient illumination for examination. When this occurs, other types of lighting can be used, e.g., flexible lights, borescopes, etc. If the P/V is equipped with a manhole the inspector should be able to get inside, close enough to scrutinize all internal areas.
 - (2) The P/V must be clean enough to allow a thorough examination of all surfaces; the presence of water, grit, or other matter inhibits examination.
 - (3) If the inspector cannot satisfactorily see the area of concern with a bright light directed at the area being examined, a satisfactory internal examination cannot be conducted. In this case, the vessel should be tested by means acceptable to the OCMI to satisfy the periodic inspection requirement.

NOTE: A marine inspector must complete a satisfactory internal examination of a P/V before that inspector is authorized to exempt the vessel P/V from hydrostatic testing in accordance with 46 CFR 61.10-5(b).

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

For any vessel P/V which is constructed in such a way so as to restrict or limit visual accessibility to internal areas of interest to an inspector, in lieu of an internal exam, or when deemed necessary by the attending inspector, a hydrostatic testing or a suitable alternative acceptable to the OCMI mandated by regulation and prudent from an operational standpoint.

NOTE: Certain precautions are necessary when an inspector is going to enter a P/V. If the P/V has suffered heavy rusting there may be dangerously low levels of oxygen inside. Similarly, if the P/V has carried a hazardous substance or has been cleaned with a product that can affect a person's health, the P/V should be cleaned, vented, and certified safe for entry prior to doing an internal inspection.

- d. Alternatives. No P/V must be hydrostatically tested except when a defect is found that the marine inspector's believes may affect the safety of the P/V. In this case, the P/V should be hydrostatically tested at a pressure of 1 1/4 times the maximum working pressure (see 46 CFR 61.10-5 for specific guidance).
- (1) Nondestructive Testing (NDT) methods can be authorized as a substitute for the required hydrostatic test. A plan to employ NDT should be discussed with the cognizant OCMI.
 - (2) The methods used must provide examinations of all welds and high stress areas as well as thickness gauging of the lower portion of the P/V. Usually this will include shear wave ultrasonic procedures for crack detection in welds or the shell (high stress areas adjacent to the heads), and standard compression wave procedures for thickness gauging.
 - (3) The amount and type(s) of NDT used must satisfy the OCMI, the test action(s) should be witnessed by a Coast Guard inspector, and the details of the test should be appropriately noted in the inspection record. Items to be considered when evaluating the plan include the P/Vs age, service, conditions of operation, and examination history, especially the methods used and results of past inspections.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (4) The use of NDT in lieu of hydrostatic testing may be appropriate when there is a question of compatibility between the water and the working fluid or interior coatings. Additionally, the OCMI may accept NDT in lieu of hydrostatic testing when the working fluid cannot be used for the test because of personnel hazards or flammability (see 46 CFR 61.10-5(f) and (h)) and when the weight of the water used during the test cannot be safely supported by the P/Vs substructure.

NOTE: Backing strips (rings) and butt welded joints with one plate edge offset (see UW 13.1(k) of the ASME Code) may prevent adequate interpretation of NDT.

- e. Problems found during visual exams. If deterioration affecting the strength of the heads, shell, or welds, or evidence of a fracture is found, the extent of the problem should be determined by NDT so that repairs can be made, if possible.
- (1) If there is doubt about a condition, NDT should be used to confirm that a problem exists. Whenever possible, a 125 percent MAWP hydrostatic test should be conducted to determine the suitability of a P/V for continued service.
 - (2) If a condition requires repair, it may be necessary to remove the P/V from service until the problem has been corrected. Repairs of P/Vs should be made only as allowed by 46 CFR Part 59 and the ASME Code. Weld procedure information and similar guidance for repairs are available through Commandant (G-MOC) and the MSC.
 - (3) Additional NDT and a hydrostatic test should be required for any P/V after repairs have been completed. The test pressure should be the same as that required by the Code at original construction: 150 percent MAWP for Section VIII, Division 1 or 125 percent MAWP for Division 2. Foreign-built P/Vs that have been accepted with design safety factors less than 4:1 should have a test pressure specified by the Coast Guard as noted above.
- f. Hydrostatic test. A hydrostatic test at a pressure equal to 125 percent of the MAWP subjects the P/V to a greater load than it will be exposed to in normal operation, but that it is reasonable to assume the P/V can withstand under ordinary conditions.
- (1) The test pressure should be applied for a sufficient period of time to allow the load to act on any defect. For air receivers, a period of 5 to 10 minutes is normally adequate. If the P/V has developed a crack or has suffered deterioration, the hydrostatic test will be proof of its present condition. Simply stated, if the P/V under test pressure does not rupture, then it can be assumed that it is acceptable for continued service. If the P/V fails while under hydrostatic pressure, the load will be quickly relieved as the water vents through any resulting fracture.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (2) In some special circumstances, the appropriate test pressure to satisfy the periodic testing requirements is less than 125 percent of the P/V's MAWP. Many foreign-built P/Vs and some domestically-built P/Vs, such as those built to ASME Section VIII, Division 2 specifications, do not meet the allowable stress criteria of ASME Section VIII, Division 1. Instead, they are designed for higher allowable stresses and for this reason are allowed to be tested at a pressure designated by the Coast Guard during the plan review process. This fact may not always be obvious and marine inspectors should carefully review the P/V's data plate to determine the appropriate test pressure.
- (3) Hydrostatic leak tests for P/Vs used for the storage of air or similar compressible gases require the P/V to be depressurized and then filled with water.
- (a) In order to properly fill the P/V with water, it must be vented at its highest point. The relief valve must be removed and its opening plugged tightly. All other connections to the P/V must be closed tight or removed and plugged. The inspector should trace the water source upstream from the P/V to verify supply, and should also verify water pressure in the P/V. This is normally accomplished with a pressure gauge installed on the P/V.
- (b) A word of caution is offered against the use of very cold water as the test fluid. In rare instances, with water at temperatures near freezing, embrittlement can result and cause failure of welds during a test. The test fluid should be no less than 60°F, if possible.
- (c) After the pressure has been increased to 125 percent MAWP, the supply should be secured and the pressure held for a period of time sufficient to determine that there are no leaks. During this time the inspector should examine all the exterior surfaces of the P/V, with special attention given to the welds and their heat affected zones of all nozzles, manways, and similar openings.
- g. Other test considerations. The regulations in 46 CFR 197.462(b) and (d) require periodic pneumatic and hydrostatic tests of pressure vessels for human occupancy (PVHOs) and contain guidelines for these tests. Whenever a compressed gas leak test or pneumatic overpressure test is performed, certain additional safeguards should be employed. The regulations include a general requirement for suitable precautions for these tests, such as ensuring that the P/V is substantially bolted down to a firm foundation; conducting the test in a remote location (or, requiring all persons not involved with the test to leave the area until the test has been completed); and conducting the test with the P/V behind some form of a barrier or substantial structure, if possible. If the P/V is a multi-lock chamber, each lock should be pressurized separately.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- h. Intervals for testing. Each tank must be subjected to the tests and inspections described in 46 CFR 38.25. Intervals for internal examinations and hydrostatic tests for Pressure Vessel Type Cargo Tanks (PVCTs) are to be computed from the date of the last credit internal examination or hydrostatic test. It is not intended that extensions for testing intervals be granted except in the most unusual circumstances. All requests by industry for extensions of internal examination or hydrostatic test intervals of PVCTs should be forwarded to Commandant (CG-CVC) with an endorsement by the OCMI.

P. INSPECTION OF LIFESAVING SYSTEMS

1. Introduction

Each Title 46 CFR subchapter on inspected vessels requires that inspections for certification include tests and inspections of the lifesaving equipment. The inspections and tests in this section are designed to verify that the equipment, as installed on the vessel, complies with regulations in 46 CFR Chapter I and, where applicable, the International Convention for the Safety of Life at Sea (SOLAS).

- a. Conditions of approval. The installation of each lifeboat, rescue boat, liferaft, and their respective launching appliance must meet any special conditions of its approval. Any such conditions are identified on the equipment's Certificate of Approval. Check approval records in MISLE. The contents of the approval certificate and its status (approved, expired, former may use, or former may not use) may also be found at <http://cgmix.uscg.mil>
- b. Excess lifesaving equipment. Excess lifesaving equipment carried aboard inspected vessels must be of approved types and kept in good operating condition.
- c. Repair, modification, and special inspection procedures. See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter C2 and various NVICs for more detailed information on repairs, modifications, and special inspections of lifesaving equipment. Under current SOLAS requirements (Regulations III/20 and III/36), maintenance instructions for all lifesaving equipment are required on board and equipment must be maintained according to the instructions.
- (1) Some instructions may state or imply that certain inspections and repairs must be performed by a manufacturer's representative. This is enforceable when it comes to the servicing of inflatable liferafts, servicing of non-disposable hydrostatic release units, and permanent repairs to inflated rescue boat components, all of which must be done by a Coast Guard-approved facility.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

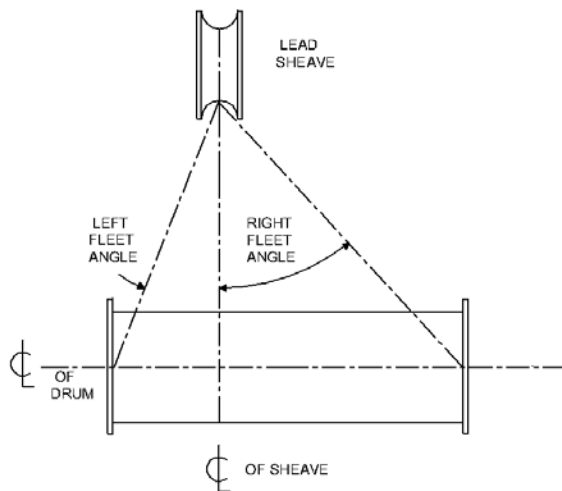

- (2) The inspector should be satisfied that other inspections and repairs are carried out by competent persons. In some cases, a manufacturer's representative may be the only available choice.
- d. Loading procedures. Many of the tests in this section for launching appliances require the boat to be loaded or overloaded with deadweight. Adequate safety precautions should be taken during loading of the boat. Personnel should not be permitted to be used in the tests that load the boat to or beyond rated capacity, except as is absolutely necessary to load or unload the boat, or perform some part of the test once the boat has reached the water.
- (1) Open lifeboats are required to have engine boxes that are watertight up to the level of the cover. Although not recommended, the owner or shipyard may elect to load an open boat by filling it with water. (See NVIC 6-81 for details on using water for this purpose and use of a test waterline.)
- (2) Enclosed and partially enclosed boats do not normally have watertight engine boxes and cannot be flooded. Any weights that can be properly distributed can be used.
- (3) Experience has shown that bags of sand or other fine material inevitably leak and create a cleanup problem. Bags of lead shot with carrying handles are more efficient and less likely to be a problem.
- (4) Large water containers can be used. Large capacity water bags may be difficult to use successfully. These bags, without baffles or compartments, allow a free surface effect that can destabilize the lifeboat, especially if the bags are at or above seating level, raising the center of gravity. This method may also not provide for a thorough distribution of weight. Smaller bags or buckets of a capacity easily handled should be used and distributed uniformly, including the area in way of the keel.
- e. Weight conditions "A" and "B." Lifeboats have two weights stamped on their approval plates.
- (1) The condition "A" weight is the empty boat without equipment and fuel.
- (2) The condition "B" weight is condition "A" plus the weight of all equipment, fuel and the number of persons for which the boat is approved. The current standard weight used to compute the "B" weight is 181.5 lbs (82.5 kg) per occupant for lifeboats on cargo ships and 165 lb (75 kg) per occupant on passenger ships. For lifeboats installed before July 1, 2010, use the weights marked A and B on the lifeboat's permanent placard, which would be based on 165 lbs per occupant for all lifeboats.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

f. Definitions:

- (1) Auxiliary launching systems consisting of a winch and davit arrangement are provided for free-fall lifeboats for use in those cases where it may be unsafe to launch the boat in free-fall. These systems must meet many of the same requirements as a conventional davit and winch.
- (2) Fleet angle, referring to a wire rope leading to a winch drum, means the angle included between an imaginary line from the lead sheave perpendicular to the axis of the drum, and the line formed by the wire rope when led from the lead sheave to either extremity of the drum. See figure P-1 below.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

Figure P-1: Fleet angle

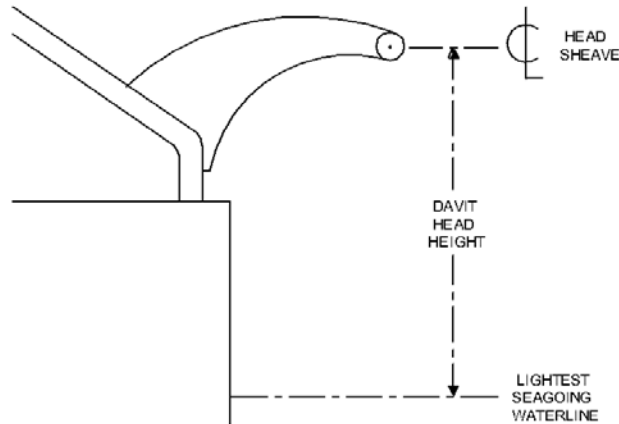

Figure P-2: Representation of davit head height for calculating lowering speed

- (3) Free-fall launching systems launch a survival craft by allowing it to fall from its stowage position into the sea, with persons on board. Most free-fall systems include a ramp that the survival craft slides down before it begins its free-fall. Special seating, hull design, and fall trajectory provide for the safety of those on board, and also ensure that the craft moves away from the vessel when it enters the water, whether or not the engine has been started.
- (4) Inflatable Buoyant Apparatus (IBAs) are similar to inflatable liferafts, except they do not have canopies. Larger IBAs can be used either side up. IBAs must be serviced in the same way as inflatable liferafts. On vessels, IBAs can be substituted for conventional life floats and buoyant apparatus. With the approval of the Commandant (CG-CVC), IBAs may be allowed to be substituted for inflatable liferafts on inshore waters.
- (5) Marine evacuation systems consist of a slide or chute, an inflatable platform, and associated survival craft, designed to rapidly transfer large numbers of persons from an embarkation station directly to the survival craft or to the platform for subsequent embarkation into the survival craft.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

2. Initial Inspections

The following inspections are intended for a vessel undergoing its initial inspection for certification. The applicable tests should also be conducted whenever new lifesaving equipment is installed on any vessel, or whenever any item of lifesaving equipment is structurally repaired, altered, or undergoes any other major repair which could affect its performance. This subpart is written on the assumption that equipment on a vessel undergoing its initial inspection is new.

- a. Davit and winch launching systems for lifeboats, including auxiliary launching systems for free-fall lifeboats. (See MSM Volume II, Material Inspection, COMDTINST M16000.7 (series), Chapter C2 for detailed information on certain situations concerning boat handling equipment.)

- (1) Preparation for launching.

- (a) Procedure. The inspector must determine the time required for two crew members to prepare the boat for launching. Time starts with the two crew members at the boat launching station, and the boat stowed as it normally would be when the vessel is at sea. Preparation is complete once a launching crew (at least three persons) is on board and ready for launch.

- (b) Acceptance criteria. The time to prepare the boat for launching must be 5 minutes or less.

- (2) Light load. Operating the launching system at light load demonstrates that the mass of the boat is sufficient to overcome the frictional resistance of the winch, falls, sheaves, blocks, and associated gear. It verifies that the minimum lowering speed can be achieved in this condition. For boats with a hydrostatic lock on the release mechanism, it verifies that the lock operates at the lowest operational hydrostatic pressure. This test can generally be completed quickly, since no special loading is required for a fully equipped boat.

- (a) Procedure.

[1] The boat should approximate its condition "A" weight for this test, with added weight of equipment and fuel on board. Precise loading and load measurement is not necessary, however. In addition, one person may be on board to operate an onboard winch brake control or the release mechanism. If additional personnel are needed to complete the test and to recover the boat, they may board when the boat reaches the water.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- [2] Release the gripes, if necessary. Tricing, frapping, and/or bowing gear do not need to be used for this test if they are not needed.
- [3] Lower the boat by releasing the winch brake. If the winch brake is arranged for control from within the boat, a person on board the boat should operate the winch brake control.
- [4] Determine lowering speed by timing the boat as it drops through a measured distance marked on the side of the vessel or on the falls, or by any other reliable means. The speed measurement should be taken only after the winch has accelerated to full-governed speed.
- [5] Launch the boat into the water using the normal launching procedure as specified in the ship's training manual and the equipment markings.
- [6] Recover the boat with the winch. Anyone on board the boat should disembark when it reaches deck level. No one should be on board the boat when the weight of the davit is taken up by the winch, and the davit moves into its stowage position. This is when most fall and fall attachment failures occur.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

NOTE:

Release mechanisms approved under approval series 160.133 and installed prior to January 1, 2013 will typically have a hydrostatic lock that allows the hooks to be released only once the boat is in the water. However, all lifeboats approved under approval series 160.135 after January 1, 2013 will have a hydrostatic interlock or some other means to ensure the lifeboat is waterborne before the release mechanism can be activated. With the keel of the boat at or just in the water and tension on the falls, it should be verified that the hydrostatic lock prevents operation of the release mechanism. Then with the boat lowered into the water, the hydrostatic lock should open and permit operation of the release mechanism.

An automatic release mechanism (approval series 160.170) is sometimes used on a boat or survival capsule with a single fall launching system. Once set or cocked, these devices release as soon as tension is off the fall. Set these devices for automatic operation for this test. If a person will be on board the boat as it is lowered, that person should set the release mechanism for automatic operation just before the boat reaches the water.

Some older style release mechanisms such as “Rottmer” gear, typically still found in open lifeboats, will release the boat from the falls whenever the release handle is moved, whether the boat is in the water or not. Persons in command of the boat and operating these mechanisms must fully understand the danger of serious injury or death resulting from premature operation.

Release the boat from the falls using the on-load release mechanism control as the boat reaches the water. The keel of the boat should be at or in the water, but there should still be tension on the falls when the release mechanism is operated. A release handle safety pin, if fitted, should not be removed until the boat is in position for release.

(b) Acceptance criteria.

[1] There must be no deformation of or damage to the launching appliance or its connections to the vessel.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- [2] Except for free-fall lifeboat auxiliary launching systems, the lowering speed for systems with winches (160.115 approval series) must be at least

$$S = 0.7*(0.4 + (0.02 H))$$

where S is the speed of lowering in m/s, and H is the height in meters from davit head to the waterline at the lightest seagoing condition. For the purposes of this calculation, H must not be greater than 30, regardless of the actual height of the davit head.

In English units, the formula is

$$S = 0.7*(79 + (1.2 H))$$

where S is in ft/min and H is in ft, with H not greater than 99.

- [3] Auxiliary launching systems for free-fall lifeboats must safely and successfully lower the lifeboat. No minimum speed applies.
- [4] The lowering speed for systems with winches approved only under the 160.015 approval series must be at least 40 ft/min (0.2 m/s), except that in the case of winches designed for passenger vessel “emergency lifeboats”, the speed must be at least 60 ft/min (0.3 m/s). The carriage requirements for two lifeboats “for use in an emergency” apply to SOLAS passenger vessels built prior to July 1, 1986, pre-dating the carriage requirements of SOLAS rescue boats incorporated in the 1983 SOLAS. See SOLAS '74 unamended, Chapter III, Part B, Regulation 27.

NOTE: A winch in the 160.115 approval series may be used to replace a winch in an older davit installation where the higher speed requirements do not apply. In this case, the winch may be set up to meet the speed requirement in this paragraph.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- [5] The brake must be a deadman type, always applied unless the operator holds the control handle or mechanism in the position to lower the boat. If the operator releases the brake handle/mechanism, the handle/mechanism returns to the stop position, thus applying the brake and stopping the boat. No additional force is permitted.
- [6] Each winch drum must be arranged so the fall wire winds onto the drum in a level wrap. There must be no more than one layer of wire on the drum when the davit is in stowed position, except that if the maximum fleet angle is not more than 4°, two layers of wire are acceptable on a grooved drum. Winches must be demonstrated to wind the falls evenly on and off the drum, regardless of whether the drum is grooved or smooth. The fleet angle must not exceed 8° in any winch installation.
- [7] For a multiple fall system, the falls must wind off the drums at the same rate when lowering. The falls must wind onto the drums evenly and at the same rate when hoisting.
- [8] For launching appliances arranged for control from within the boat, there are two basic types of control.
- aa. One of these types uses a control wire that pays out as the boat lowers. The control wire must properly operate the winch brake throughout the launching sequence. There must be sufficient length of control wire available inside the boat to operate the winch brake until the boat is released from the falls.
- bb. The other type is a pull-and-go system. An operator in the boat pulls a control lever or handle on the launching appliance that is accessible from a position on board the boat. Once the control is activated, it holds the brake control in the lower position, until a crew member on deck returns it to stop.
- [9] The release mechanism must open all hooks simultaneously and release the boat into the water in the intended manner.
- [10] Except for free-fall lifeboat auxiliary launching systems, survival craft installations approved under approval series 160.115 and 160.132 must be capable of launching the survival craft under unfavorable conditions of trim of up to 10° and with the vessel listed up to 20° either way. For other installations, the trim requirement is 10°, but the list requirement is 15°. Prototype launching systems are tested at these extremes prior to approval. It will not normally be possible to test launching systems installed on a vessel at these extremes, but the inspector

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

should verify that nothing about the installation would appear to impede launching under these conditions.

- (3) 10 percent overload. The 10 percent overload test demonstrates that the launching system can safely launch a fully loaded boat with a 10 percent margin for overloading.

(a) Procedure.

- [1] The boat must be in its embarkation position. Tricing pendants, if any, must be disconnected. The boat should be held alongside the ship during loading by means of the installed frapping, and/or bousing gear.
- [2] Load the boat so that its total weight is 110 percent of the condition "B" weight shown on its data plate. Hold the boat in position for at least 10 minutes and check for deformation, especially at davit and winch foundations and other load-bearing members.
- [3] Lower the boat using the normal lowering procedure, using the on-deck winch control position.
- [4] Determine lowering speed by timing the boat as it drops through a measured distance marked on the side of the vessel or on the falls, or by any other reliable means. The speed measurement should be taken only after the winch has accelerated to full governed speed.
- [5] After the boat passes through the measured distance, stop lowering by releasing the winch brake control. Then alternately release and apply the brake so the boat stops at approximately 2 m (6 ft) intervals. Complete at least three start-stop cycles. The lowering operation should be carefully planned, so that the boat will not have to be raised to complete the start-stop cycles. Most winches will not be capable of raising the loaded boat.
- [6] Stop lowering just as the boat reaches the water. The keel of the boat should be at or in the water, but there should still be tension on the falls. Release the boat from the falls using the on-load release mechanism control. Release mechanisms with a hydrostatic interlock will require use of the emergency override device to permit on-load release. For lifeboats installed after January 1, 2013, the interlock override will include special mechanical protection that must be deliberately destroyed, e.g. by breaking a protective glass or translucent cover. The restoration of the release mechanism in these cases should be planned for, and may require a service technician.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

[7] Unload the boat, recover it with the winch, and return it to its stowed position. Observe operation of the limit switches as the davit approaches the stowed position. Anyone on board the boat should disembark when the boat reaches deck level. No one should be on board the boat when the weight of the davit is taken up by the winch, and the davit moves into its stowage position. This is when most fall and fall attachment failures occur.

(b) Acceptance criteria.

[1] There must be no deformation of or damage to the launching appliance or its connections to the vessel.

[2] Except for free-fall lifeboat auxiliary launching systems, the lowering speed for systems with winches (160.115 approval series) must be at least:

$$S = 0.4 + (0.02 H)$$

where S is the speed of lowering in m/s, and H is the height in meters from davit head to the waterline at the lightest seagoing condition. For the purposes of this calculation, H must not be greater than 30, regardless of the actual height of the davit head.

In English units, the formula is

$$S = 79 + (1.2 H)$$

where S is in ft/min and H is in ft, with H not greater than 99.

[3] Auxiliary launching systems for free-fall lifeboats must safely and successfully lower the lifeboat, but no minimum speed applies.

[4] The lowering speed for systems with winches (160.115 approval series), including auxiliary systems for free-fall lifeboats, must not exceed 1.3 m/s (256 ft/min).

[5] The lowering speed for systems with winches approved only under the 160.015 approval series must not normally exceed 120 ft/min (0.6 m/s). The lowering speed for winches designed for passenger vessel emergency lifeboats must not normally exceed 160 ft/min (0.8 m/s). Check certificates of approval, or approval records in MISLE or CGMIX for approved deviations from these requirements.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

NOTE: A winch in the 160.115 approval series may be used to replace a winch in an older davit installation where the higher speed requirements do not apply. In this case, the winch may be set up to meet the speed requirement in this paragraph.

- [6] The brake must be a deadman type, always applied unless the operator holds the control handle or mechanism in the position to lower the boat. If the operator releases the brake handle/mechanism, the handle/mechanism returns to the stop position, thus applying the brake and stopping the boat. No additional force is permitted.
- [7] The action of releasing the winch brake control must bring the boat to a stop within 1 m (39 in). No additional force on the winch brake control is permitted. The brake action must be smooth and positive.
- [8] Each winch drum must be arranged so the fall wire winds onto the drum in a level wrap.
- [9] For a multiple fall system, the falls must wind off the drums at the same rate when lowering. The falls must wind onto the drums evenly and at the same rate when hoisting.
- [10] For launching appliances arranged for control from within the boat, the untended control wire must feed out properly with the boat. The winch brake operation must not be affected by the mass of the fully extended control wire.
- [11] The release mechanism must open all hooks simultaneously and release the boat into the water.
- [12] The limit switches must disconnect the winch power source 0.3 m (12 in) or more before the davit reaches its fully stowed position.
- (4) Exposed wet brake. Conduct this test if any winch brake surface is exposed to the weather.
- (a) Procedure. Thoroughly wash down the exposed brake surfaces with water. Repeat the 10 percent overload test described in P.2.a.(3) above while the brake surfaces are still wet.
- (b) Acceptance criteria. The brake must stop the winch when the brake surface is wet, but the 1 m stopping distance requirement does not apply.
- (5) Launching underway. This test is intended to demonstrate that the boat can be launched satisfactorily when the vessel is underway at 5 knots, and also that the boat

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

can be launched satisfactorily when the vessel is moored in a current. This test should normally be completed during the trial trip. The test may be waived if the builder, owner, or equipment manufacturer can provide evidence that such a test has been successfully completed for the boat/davit/winch combination on a sister vessel. For the purposes of this test, a sister vessel is one which is generally of the same size and hull form, and where the launching position, including height above the water line, is the same.

- (a) Procedure. Launch one boat of each type on board with only the required operating crew on board and the vessel proceeding at a speed of approximately 5 knots. No special loading of the boat is required. Use the manufacturer's recommended launching procedure.
 - (b) Acceptance criteria. The boat must not give any indication that it is unstable or out of control during the launching procedure. The boat's painter release device must operate as intended.
- b. Free-fall lifeboat launching systems. Free-fall lifeboat and launching system installation tests are conducted with the vessel on an even keel at its lightest seagoing draft. The tests described in this section may be conducted in any order appropriate to facilitate test loading.
- (1) Light load.
 - (a) Procedure.
 - [1] The boat should be arranged for launching by a launching crew on board the boat. Although not required, trial launchings would normally be carried out by the manufacturer's representative before the inspection for certification begins.
 - [2] The boat should approximate its condition "A" weight for this test, with added weight of equipment and fuel on board. Precise loading and load measurement is not necessary. In addition, the minimum launching crew should be on board to operate the on-board launching control.
 - [3] The launching crew should launch the boat in free-fall by one of the two independent activation systems for the release mechanism which must be operated from inside the lifeboat. The boat should then be retrieved and examined with respect to the acceptance criteria below.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**(b) Acceptance criteria.

- [1] There must be no deformation of or damage to the launching appliance or its connections to the vessel.
- [2] There must be no deformation of or damage to any seat or seat mounting in the lifeboat.
- [3] There must be no cracks or other structural damage to the hull of the lifeboat or any other structurally important part of lifeboat. Cracks in structural members of a free-fall lifeboat indicate that the structure must be replaced.
- [4] There must be no cracks in non-structural members that could break loose during a free-fall launching.
- [5] The free-fall release mechanism must operate properly and release the boat from the launching appliance.
- [6] The launching system must operate smoothly, must launch the boat into the water at the intended angle, and must not show any evidence of improper operation.
- [7] The lifeboat must not show any evidence of instability or dangerous characteristics during the launching sequence. Water entry angle will normally be between 40 degrees and 70 degrees from the horizontal. The momentum of the boat should move it away from the vessel after it enters the water.
- [8] There must be no injury to any personnel in the boat attributable to the free-fall performance of the boat.
- [9] If the inspector has reason to believe that the boat is not being launched in a safe and proper manner, the inspector may order that the test be repeated with the boat instrumented with acceleration monitoring equipment. Consult IMO Resolution MSC.81(70) entitled, Revised recommendation on Testing of Life-saving Appliances” Part 1/6.17 for information on measuring and evaluating acceleration forces. The monitoring and analysis should be done by, or under the supervision of, an independent laboratory accepted by the Commandant (CG-ENG-4) for this purpose. The test results are compared with the approval test data to determine whether or not the boat is being launched in a safe and proper manner.

(2) 10% overload test.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (a) Procedure. Load each seat in the lifeboat with 82.5 kg to 100 kg (181.5 lbs to 220 lb) of deadweight properly secured in place to simulate the weight of one person.
- [1] Add additional weights using equipment lockers, if necessary, to bring the total boat weight to 1.1 times the condition "B" weight.
- [2] The launching crew should launch the boat in free-fall by one of the two independent activation systems for the release mechanism which must be operated from inside the lifeboat. The boat should then be retrieved and examined with respect to the acceptance criteria outlined for the light load test above.
- (3) Conduct this test if the launching system incorporates an adjustable ramp.
- (a) Procedure.
- [1] Load each seat in the lifeboat with 82.5 kg to 100 kg (181.5 lb. to 220 lb.) of deadweight properly secured in place to simulate the weight of one person. Add additional weights to bring the total boat weight to 1.2 times the condition "B" weight.
- [2] Move the ramp throughout its intended range of operation.
- [NOTE: The 1.2 times condition "B" loading is derived from IMO Resolution MSC.81(70) Part 2, Paragraph 6.1.13. It may be advantageous to conduct this test, remove some of the weight from the boat, and then conduct the 10% overload test.]
- (b) Acceptance Criteria.
- [1] The ramp shall be able to be satisfactorily adjusted to its intended operating positions.
- [2] The ramp shall move from the stowed position to launching position using only gravity or stored mechanical power which is independent of the vessel's power supplies.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- c. Davits And Winches For SOLAS Rescue Boats and fast rescue boats. Test and inspect launching systems for SOLAS rescue boats in the same way as those for lifeboats under Section P.2.a, in addition to the following test for recovery speed. This test applies to launching systems for boats approved and used solely as rescue boats, as well as those which hold dual approval as lifeboats and rescue boats, and which are designated as the ship's rescue boat(s).
- (1) Procedure.
- (a) Load the boat with a weight equivalent to its full complement of persons and equipment (total boat weight equal to condition "B"). Each occupant is considered to weigh 82.5 kg (181.5 lb), except for rescue boats installed prior to July 1, 2010 where each occupant is considered to weigh 75 kg (165 lbs). The full complement of persons is designated by the manufacturer, and will never be less than six. If the boat is also approved as a lifeboat, its full rescue boat complement will probably be less than the number of persons it can accommodate as a lifeboat.
- (b) Determine hoisting speed by timing the boat as it rises through a measured distance marked on the side of the vessel or on the falls, or by any other reliable means. The speed measurement should be taken only after the winch has accelerated to full governed speed.
- (2) Acceptance Criteria. The hoisting speed must be not less than 0.3 m/s (59 ft/min).
- d. Launching Appliances For Davit Launched Liferafts and inflated rescue boats.
- (1) Light Load. Operating the launching system at light load demonstrates that the mass of the raft is sufficient to overcome the frictional resistance of the winch, falls, sheaves, blocks, and associated gear.
- (a) Procedure.
- [1] Prepare a test load which can be suspended from the automatic release mechanism. The test load shall equal the weight of one of the launching station's liferafts and its equipment, plus 82.5 kg (181.5 lbs) simulating the weight of one person. An inflated davit-launched liferaft carrying a 82.5 kg weight may be used for the test load, but is not required.
- [2] Lower the test weight from the embarkation deck by releasing the winch brake, and "launch" the weight using the normal automatic release procedure. If a non-buoyant test weight is used, the weight is "launched" onto a surface that will support its weight, rather than into the water. If this is not possible, an additional test will need to be devised to test the automatic release mechanism.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- [3] Determine lowering speed by timing the test weight as it drops through a measured distance marked on the side of the vessel or on the fall, or by any other reliable means. The speed measurement should be taken only after the winch has accelerated to full governed speed.
- [4] Recover the fall with the hand-operated quick-return mechanism.
- (b) Acceptance Criteria.
- [1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.
- [2] The lowering speed for a launching appliance must be at least: $S = 0.7 (0.4 + (0.02 H))$, where S is the speed of lowering in m/s, and H is the height in meters from davit head to the waterline at the lightest seagoing condition (See figures P-1 and P-2). For the purposes of this calculation, H shall not be greater than 30, regardless of the actual height of the davit head. (in English units, the formula is: $S = 0.7 (79 + (1.2 H))$, where S is in ft/min and H is in ft, with H not greater than 99).
- [3] The lowering speed for systems approved only under the 160.063 approval series shall be at least 40 ft/min (0.2 m/s).
- [4] The brake must always be applied unless the operator, or a mechanism activated by the operator, holds the brake control in the "off" position. The test weight must begin to lower each time the brake is released. No additional force is permitted.
- (c) Each winch drum shall be arranged so the fall wire winds onto the drum in one or two level wraps.
- (d) The automatic release mechanism must open and release the test weight only after the apparatus is set to open automatically and the load of the test weight is off the fall.
- (e) The operation of the hand-operated quick-return mechanism must be smooth, rapid, and easy enough for one person to recover the fall.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

(2) 10% Overload.

(a) Procedure.

[1] Prepare a test load which can be suspended from the automatic release mechanism. The test load shall equal:

$$1.1*(W + M*P) \quad (\text{in kg})$$

$$1.1*(W + M*P) \quad (\text{in lb})$$

where W is the weight of one of the launching station's liferafts and its equipment, M is 75 kg (165 lbs) for passenger vessels or 82.5 kg (181.5 lbs) for all other vessels, and P is the number of persons the liferaft is approved to accommodate. An inflated davit-launched liferaft carrying additional weight may be used for the test load, but is not required.

Alternatively, the test load may be:

$$1.1*SWL$$

where SWL is the least of the three approved working loads for the davit, winch, or automatic release mechanism.

[2] Lower the test weight from the embarkation deck by releasing the winch brake.

[3] Determine lowering speed by timing the test weight as it drops through a measured distance marked on the side of the vessel or on the fall, or by any other reliable means. The speed measurement should be taken only after the winch has accelerated to full governed speed.

[4] After the test weight passes through the measured distance, stop lowering by releasing the winch brake control. Then alternately release and apply the brake so the test weight stops at approximately 2 m (6 ft) intervals. Complete at least three start-stop cycles. The lowering operation should be carefully planned, so that the weight will not have to be raised to complete the start-stop cycles, since it may not be possible to raise the weight with the winch.

[5] "Launch" the weight using the normal automatic release procedure. If a non-buoyant test weight is used, the weight is "launched" onto a surface that will support its weight, rather than into the water. If this is not possible, an additional test will need to be devised to test the automatic release mechanism.

[6] Recover the fall with the hand-operated quick-return mechanism.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

(b) Acceptance Criteria.

- [1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.
- [2] Except as indicated in [3] and [4] below, the lowering speed for launching appliances must be at least: $S = 0.4 + (0.02 H)$ where S is the speed of lowering in m/s, and H is the height in meters from davit head to the waterline at the lightest seagoing condition (See figures P-1 and P-2). For the purposes of this calculation, H shall not be greater than 30, regardless of the actual height of the davit head. (In English units, the formula is $S = 79 + (1.2 H)$ where S is in ft/min and H is in ft, with H not greater than 99.)
- [3] The lowering speed for 160.163 approval series launching appliances must not exceed 1.3 m/s (256 ft/min).
- [4] The lowering speed for systems approved only under the 160.063 approval series shall not exceed 120 ft/min (0.6 m/s).
- [5] The brake must always be applied unless the operator, or a mechanism activated by the operator, holds the brake control in the "off" position. The test weight must begin to lower each time the brake is released. No additional force is permitted.
- [6] The action of releasing the winch brake control must reapply the brake and bring the test weight to a stop within 1 m (39 in). No additional force on the winch brake control is permitted. The brake action must be smooth and positive.
- [7] Each winch drum shall be arranged so the fall wire winds onto the drum in one or two level wraps.
- [8] The automatic release mechanism must open and release the test weight only after the apparatus is set to open automatically and the load of the test weight is off the fall.
- [9] The operation of the hand-operated quick-return mechanism must be smooth, rapid, and easy enough for one person to recover the fall.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- (3) Exposed Wet Brake. Conduct this test if any winch brake surface is exposed to the weather.
- (a) Procedure. Thoroughly wash down the exposed brake surfaces with water. Repeat the 10% overload test under Section 6.P.2.d.(2) while the brake surfaces are still wet.
- (b) Acceptance Criteria. The brake must stop the winch when the brake surface is wet, but the 1 m stopping distance requirement does not apply.
- (4) Simulated Towing Strain. Test the automatic release mechanism to determine that it can be manually released under a towing strain.
- (a) Procedure.
- [1] Use the 10% overload test weight (Section P.2.d.(2)).
- [2] Apply a horizontal force to a floating test weight, or simulate a towing strain on a floating liferaft by applying a horizontal force to the non-buoyant test load. A sufficient force should be applied to the fall to bring it to an angle of approximately 5 degrees from vertical. The horizontal force may be applied by a motor vessel, a vehicle, manually, or any other appropriate means.
- [3] A non-buoyant test load should be just above the surface, or just touching the surface, but with tension remaining on the fall.
- [4] First, set the automatic release mechanism to the automatic position, then operate the release manually.
- (b) Acceptance Criteria.
- [1] The automatic release mechanism must not open with tension on the fall and the release set to the automatic position.
- [2] The release mechanism must release the test load when manually operated by one person.
- e. Lifeboats And SOLAS Rescue Boats.
- (1) Coast Guard inspectors have traditionally examined every Coast Guard approved lifeboat at the factory. This system has been replaced by a system of factory production inspections by accepted independent labs, usually classification societies. Refer to the lifeboat or rescue boat's nameplate for the name of the lab that oversaw construction. The same lab must also be listed on the boat's

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

approval certificate. Refer to MISLE to CGMIX for the boat's certificate information if not available on board the vessel. Therefore, this operational test during the initial inspection for certification is or will be the Coast Guard's only opportunity to examine individual boats before they go into service on U.S. vessels.

(a) Lifeboats And SOLAS Rescue Boats. Operate each lifeboat and rescue boat in the water for at least two hours. The Coast Guard inspector does not need to be aboard the boat for the full two hours.

[1] During this time, the propulsion system is operated both forward and astern. At least one hour of this running time is with the propulsion system operating at full speed.

[2] Operate each boat system, such as any powered bilge pump, or the water spray system that are required on tanker lifeboats.

[3] Check all engine starting systems for proper operation. Lifeboats (approval series 160.135) and SOLAS rescue boats (approval series 160.156) must either have a manual starting system or a power starting system with two rechargeable energy sources, each capable of starting the engine.

Note: Existing lifeboats approved only under the 160.035 approval series must have a manual starting system, unless they have been retrofitted to meet SOLAS requirements. New installations of 160.035 lifeboats are only allowed as replacement-in-kind on existing vessels and offshore facilities. See 46 CFR 199.10(i). Check the list of accepted engines on CGMIX at <https://cgmix.uscg.mil/Equipment/> to determine the required engine starting system. The engine(s) with which the lifeboat or rescue boat was approved are listed on the boat's approval certificate. See section P.3.e.(8) if problems are suspected with hydraulic engine starting systems.

[4] Check the pressure on any air supply system installed on a tanker lifeboat, but testing the air supply system should not be necessary on a new boat.

[5] Compare compass readings with several known bearings in different directions.

[6] Operate the emergency steering system in totally enclosed lifeboats.

(b) Hand-Propelled Lifeboats. Operate each hand-propelled lifeboat in the water for period of time sufficient to determine that it operates properly

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

both forward and astern. Compare compass readings with several known bearings in different directions.

(c) Oar-Propelled Lifeboats. New installations of oar-propelled lifeboats are only allowed as replacement-in-kind on existing vessels. Operate each oar-propelled lifeboat in the water with a crew sufficient for each oar and the tiller. Compare compass readings with several known bearings in different directions.

(d) Acceptance Criteria.

[1] The boat and each of its systems must operate properly without overheating or being damaged.

[2] The boat must not have any evident leakage through the hull or around any through-hull fitting.

[3] If compass errors exceed 10 degrees, the compass should be adjusted using the compensating mechanism to minimize the errors. A compass deviation card should be prepared and mounted on or near the compass.

[4] In totally enclosed, fire-protected lifeboats, the water spray system sprinkler heads must operate properly and provide a uniform flow of water over the surface of the lifeboat. Hatch and glass gaskets, dogging devices, and other closures should prevent entry of water.

(e) Battery Chargers. Batteries for engine starting and searchlights must have a means for recharging from the ship's power supply at a supply voltage not exceeding 50 Volts which can be disconnected at the boat embarkation station. Solar battery chargers may be an approved equivalent, however, determine that the battery charging systems are functional and in accordance with 46 CFR Subchapter J.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- f. Boats And Davits Not Credited As Lifesaving Equipment. Some vessels by nature of their operation, carry special boats and launching equipment in addition to those required for lifesaving purposes. Survey launches, personnel boats, workboats, and similar craft are not subject to approval as lifesaving equipment, but should be sufficiently seaworthy for the waters in which they will be used. New boats may meet the applicable requirements of 33 CFR 183, but this is not a requirement if the boat will be used solely for commercial purposes. In this case, only the requirements of 46 CFR Subchapter C apply. Launching equipment for such craft is often intended only to handle an empty boat, with embarkation and debarkation taking place with the boat in the water. However, if the launching equipment results in personnel being suspended over water on wires, the launching equipment and attachments should be checked by a 10% overload test, similar to that for lifeboat and rescue boat launching appliances. After the test, the boat attachments should be visually checked for cracking and distortion. Appropriate data plates should be installed on both the winch and davit.
- g. Hydrostatic Release Units. Check each hydrostatic release unit used in an item of lifesaving equipment, including those used in certain 406 MHz satellite EPIRBs. (See NVIC 4-86 for guidelines on installation of hydrostatic release units for survival craft.)
- (1) Disposable Releases. Disposable hydrostatic releases must be marked with their expiration date using the tabs on the label. This must be done when the release is installed.
 - (2) Hidden Installations. Some hydrostatic releases, especially those used on certain EPIRBs, can not be readily seen when the equipment is properly installed. If the servicing date or expiration date on an installed hydrostatic release can not be readily seen, a label should be applied in a location where it can easily be seen. The label should indicate that the device uses a hydrostatic release, along with its servicing or expiration date.
 - (3) Weak Links. An important part of a float-free survival craft installation is the weak link which secures the survival craft painter to the vessel. Different weak link arrangements are used with different hydrostatic releases. The weak link arrangement must agree with the instructions of the hydrostatic release manufacturer, the survival craft manufacturer, or NVIC 1-83 in the case of life floats and buoyant apparatus.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- h. Ring Lifebuoys, Life Floats, And Buoyant Apparatus. Check the covers of the ring lifebuoys, life floats, and buoyant apparatus to make sure they are intact and that buoyancy material is not exposed. Check cordage to make sure that it is good condition, and not weakened by weathering. Stowage arrangements should allow these devices to be readily cast loose, or to float free, as required by the regulations. Check painters for life floats and buoyant apparatus with the guidance in NVIC 1-83.
- i. Ring Lifebuoy Quick-Release Device. A quick-release device is required for two ring lifebuoys on vessels on international voyages. The lifebuoys must have a floating electric water light and a self-activating smoke signal attached to them.
- (1) Procedure. Operate each quick-release device. A self-activating smoke signal is not required for this test if a dummy device of comparable size and weight is used. A lanyard may be used to keep the ring buoy and its accessories from falling to the surface, or hitting the side of the vessel. Activation of the smoke signal, in particular, should be avoided.
- (2) Acceptance Criteria. The quick-release device must be able to be operated from the bridge. The ring lifebuoy and its attachments must be properly released and drop clear of the side of the vessel. The smoke signal must be mounted properly so that it will ignite when the ring buoy is released.
- j. Floating Electric Water Lights. Check the number and installation of each floating electric water light on board. Activate each one briefly to confirm that the battery is fresh and properly installed.
- k. EPIRBs And SARTs.
- (1) Test each Emergency Position Indicating Radio Beacon (EPIRB) and each Search and Rescue Radar Transponder (SART), except an EPIRB or SART in an inflatable liferaft. Use the test switch and output indicator to determine that the device is operating properly. The "TEST" switch or switch position can be used at any time, since no signal is transmitted. Avoid using the "ON" position to test an EPIRB. Note that some EPIRBs may have a "TEST/ON" position. These EPIRBs go through a test cycle before beginning to transmit an emergency signal. These EPIRBs should be switched back to the "ARMED" or "READY" position as soon as the test cycle is complete.
- (2) Confirm that the operator has registered a 406 MHz satellite EPIRB with the National Oceanographic and Atmospheric Administration (NOAA). If operators need assistance with registration, they can use the following website to register: <http://beaconregistration.noaa.gov/>. Alternatively, registration inquiries can be addressed with NOAA at:

SARSAT Beacon Registration

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

National Oceanic and Atmospheric Administration

Suitland, MD 20746
Phone: 301.817.4515
Toll free: 888.212.7283
Fax: 301.817.4565

1. Lifejackets, Immersion Suits, And Work Vests.

- (1) Examine each lifejacket, immersion suit, and work vest to determine that the proper number are on board, and that each is in serviceable condition, equipped with retroreflective material, and properly marked with the name of the vessel. (See section 18.H.4.e and NVIC 14-92 if "Extended Size" lifejackets are used.) For an initial inspection, lifejackets, immersion suits, and work vests will usually be new and will not require a detailed inspection. However, if older devices are used, they should be inspected as in section P.3.m or section P.3.n. If needed to keep track of devices which have been inspected, the marine inspector may mark or stamp the lifejackets, immersion suits, and work vests to indicate that they have been inspected and passed. (See 18.H.4 and 18.H.5 of NVIC 14-92 for information on stowage and other special considerations.)
- (2) All lifejackets and immersion suits placed on board U.S. flag SOLAS ships after July 1, 2010 must have an approval number in the format 160.155/200 or above, 160.171/200 or above, respectively. See NVIC 03-10.

NOTE: Some regulations may indicate that lifejackets will be stamped "passed" once they have been inspected, however, inspectors may regard this as optional unless an operator insists that the stamps be applied.

- m. Lifejacket Lights. Each lifejacket and immersion suit on a vessel operating on ocean, coastwise, or Great Lakes voyages, must be equipped with an approved light under approval series 160.012 or 160.112. The light must be positioned near the shoulder so it will be above water when a person is wearing the lifejacket or immersion suit in the water. Except for one-use lights, such as chemiluminescent lights (chemical lights) and those with water-activated batteries, turn each light on and off to make sure it operates. The light or the power source must be marked with a date of expiration, unless it is a standard battery such as a 9-volt or D-cell. Operators of vessels operating in near-freezing waters should be aware that battery and light operation degrades in cold temperatures. In particular, chemiluminescent type lights should be avoided on vessels operating in near-freezing waters.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

- n. Whistles. Lifejackets and immersion suits on vessels on international voyages must each have a whistle attached to the device with a lanyard. The lanyard must be long enough to allow the whistle to reach the mouth of the wearer. The whistle must be a ball-type or multi-tone whistle of corrosion-resistant construction. The lanyard and whistle must both be in good, operable condition.
- o. Distress Signals. Depending upon its service, the vessel may be required to carry flares or smoke signals in an appropriate stowage location in or near the pilothouse. Flares and smoke signals must be approved, of the appropriate type required by SOLAS or the vessel regulations in 46 CFR Subchapter W and/or corresponding subchapter under which the vessel is certificated, as applicable, and not past their expiration date.
- p. Line Throwing Appliances. Check each line-throwing appliance to make sure that it has the proper stowage arrangements, and that each dated component has not expired. Each line-throwing appliance must also have the equipment on the list provided with the approved appliance. Make sure that an auxiliary line of the correct size and length is provided, and that it is in good condition. If the logbook shows that a required test firing is due, witness a test firing if it can be safely carried out where the inspection takes place.
- q. Pilot Ladders And Embarkation - Debarkation Ladders. Though not strictly "lifesaving equipment," pilot ladder inspections are covered here because of their similarity to embarkation - debarkation ladders. Any new pilot ladder is required to be approved under approval series 163.003. Rope embarkation - debarkation ladders are approved under approval series 160.117, or are approved as equivalent to chain ladders under approval series 160.017. Rope embarkation-debarkation ladders are similar to approved pilot ladders, except that embarkation - debarkation ladders are not required to have spreader steps. Chain ladders are approved under approval series 160.017. All ladders must be a single length of ladder.
- (1) See IMO Assembly Resolution A.1045(27) for information on pilot ladder installation and other pilot transfer arrangements.
 - (2) Any new embarkation-debarkation ladder on a ship certificated for international voyages, must be a rope ladder. These ladders must extend from the deck to the waterline in the lightest seagoing condition at a 15 degrees adverse list. Any other ladder must be either an approved chain ladder or rope ladder. These ladders must extend from the deck to the waterline in the lightest seagoing condition, with no list assumed.
 - (3) The embarkation - debarkation ladder must be secured to the deck adequately, and must be ready to be deployed.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (4) Approved pilot ladders and embarkation-debarkation ladders are manufactured under carefully controlled conditions, under the inspection of an independent laboratory. This assures that the ladders will be well constructed and suitable for their intended purpose. Steps are assembled to the ladder at regular intervals in a safe and proper manner. Side ropes are properly straightened and tensioned, so that the steps remain level and safe to use. These ladders, especially pilot ladders, are subject to extremely hard use, and steps will occasionally be damaged. For this reason, replacement steps are also approved. These steps are white or yellow, rather than the orange of the original steps, so that they are readily apparent to anyone inspecting or using the ladder. This conspicuous marking helps draw attention to steps which have not been installed under the same careful conditions as those of the original ladder. Vessels under Coast Guard inspection may not field assemble pilot ladders and embarkation-debarkation ladders. Such ladders will not be considered to be approved, even if assembled from approved replacement steps.
- r. Powered Pilot Hoists. Per IMO Resolution MSC.308(88), pilot hoists may not be used on SOLAS ships effective July 1, 2012. Though not strictly "lifesaving equipment," powered pilot hoist inspections are covered here because of their similarity to other lifesaving equipment inspections. The initial inspection should also include a comparison of the manufacturer's installation instructions with the mounting and power connection provisions provided on the vessel.
- (1) Suspension Cables.
- (a) Procedure. Inspect suspension cables for proper routing. Consult the manufacturer's instructions for specific guidance.
- (b) Acceptance Criteria. Suspension cables must be properly routed through sheaves and blocks. Connections at the ends of the suspension cables, such as clamping or socket arrangements must be properly made. All sheaves must be properly lubricated and turn freely.
- (2) Light Load. Operating the pilot hoist at light load demonstrates that the mass of the ladder or lift platform is sufficient to overcome the frictional resistance of the winch, falls, sheaves, blocks, and associated gear. This test can generally be completed quickly, since no special loading is required.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

(a) Procedure.

- [1] The empty ladder or lift platform should be used for this test.
- [2] Lower the hoist by operating the control lever until the ladder or lift platform reaches the water or its lowest extent of travel. Release the control lever several times while lowering.
- [3] Raise the hoist by operating the control lever until the ladder or lift platform reaches its upper extent of travel. Release the control lever several times while hoisting.
- [4] Lowering and hoisting speed do not need to be measured unless the hoist appears to be operating in an inadequate or unsafe manner.

(b) Acceptance Criteria.

- [1] There shall be no deformation of or damage to the pilot hoist or its connections to the vessel.
- [2] When the control lever is released, it must automatically return to the off position, and bring the ladder or lift platform to a safe stop. The hoist must begin to move each time the control lever is operated. No additional force is permitted.
- [3] The suspension cables must wind onto the drum in a single level wrap.
- [4] For a multiple suspension cable system, the cables must wind off the drums at the same rate when lowering. The cables must wind onto the drums evenly and at the same rate when hoisting.

(3) 10% Overload.

(a) Procedure.

- [1] Load the ladder or lift platform with deadweight so that the total load including the ladder or lift platform equals 1.1 times the working load. The working load will be shown on the nameplate of an approved pilot hoist.
- [2] Lower the hoist by operating the control lever until the ladder or lift platform reaches the water or its lowest extent of travel. Release the control lever several times while lowering.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- [3] Raise the hoist by operating the control lever until the ladder or lift platform reaches its upper extent of travel. Release the control lever several times while hoisting.
- [4] Lowering and hoisting speed do not need to be measured unless the hoist appears to be operating in an inadequate or unsafe manner.
- [5] Disconnect the power source. With one person operating the hand operating device, lower and raise the ladder or lift platform a short distance. If difficulty is encountered, the weight may be reduced to equal the working load, and the test repeated.

(b) Acceptance Criteria.

- [1] There shall be no deformation of or damage to the pilot hoist or its connections to the vessel.
- [2] When the control lever is released, it must automatically return to the off position, and bring the ladder or lift platform to a safe stop. The hoist must begin to move each time the control lever is operated. No additional force is permitted.
- [3] The suspension cables must wind onto the drum in a single level wrap.
- [4] For a multiple suspension cable system, the cables must wind off the drums at the same rate when lowering. The cables must wind onto the drums evenly and at the same rate when hoisting.
- [5] For pilot hoists with an emergency stop switch operated by a control wire on the ladder or lift platform, the untended control wire must feed out properly with the ladder or lift platform. The pilot hoist operation must not be affected by the mass of the fully extended control wire.
- [6] The hand operating device must be capable of lowering and raising the working load.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

(4) Emergency Stop Control.

- (a) Procedure. Once the hoist has been demonstrated to be in satisfactory operating condition, put a person on the ladder or lift platform. Lower the hoist, and with the control lever in position to lower the hoist, the person on the ladder or lift platform operates the emergency stop control. Repeat the test of the emergency stop control while hoisting. Test the proper operation of any other control provided on the ladder or lift platform.
 - (b) Acceptance Criteria. The emergency stop control must bring the ladder or lift platform to a safe stop regardless of the position of the on-deck control lever. Each other control on the ladder or lift platform must operate properly and safely.
- s. Abandon-Ship Simulation. Hold an abandon-ship simulation. Determine the time required for all persons on board to be launched into the water in survival craft. This test is not required if the Coast Guard has witnessed a successful test on a sister vessel with the same lifesaving appliance arrangements.

(1) Procedure.

- (a) Start timing when the signal to abandon ship is given, with all persons at the locations identified in the station bill (muster list).
- (b) No preparation of the survival craft or launching appliance is permitted until the signal is given.
- (c) This simulation must include loading and launching of sufficient survival craft to demonstrate that the acceptance criteria can be met.
- (d) If the survival craft include davit-launched liferafts, one example of each launching appliance type and arrangement on the ship must be tested. If so desired, persons may be used only in the preparing and loading operations, and ballast may be substituted for the lowering and launching part of the test. The time should be recorded for the sequence of preparing, loading, and launching all of the liferafts intended to be launched from the launching station. However, if more than three liferafts are intended to be launched from the launching station, the test may be limited to three liferafts. The total time required to launch all of the liferafts can be extrapolated from this data.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (e) If the vessel is equipped with marine evacuation systems (MES), the simulation must include full deployment of at least one system, including the launching and inflation of associated liferafts. The time should be recorded for the sequence of preparing, loading, and launching all of the liferafts intended to be launched from the launching station. However, if more than three liferafts are intended to be launched from the launching station, the test may be limited to three liferafts. The total time required to launch all of the liferafts can be extrapolated from this data.
- (f) During the simulation, care must be taken to minimize the hazards associated with the loading and unloading of boats. Casualties have occurred because adequate safety precautions were neglected or because personnel took needless chances.

(2) Acceptance Criteria.

- (a) For cargo ships, the abandonment time must be 10 minutes or less.
 - (b) For passenger ships, the abandonment time must be 30 minutes or less.
- t. Abandon-Ship Drill And Fire Drill. Once the vessel's initial operating crew is aboard, conduct an abandon-ship drill and a fire drill as described in section P.3.v below.

3. Subsequent Inspections For Certification

Each item of lifesaving equipment is inspected to determine that it is in serviceable condition. Each item not in serviceable condition is repaired or replaced. Each item of survival equipment with an expiration date on it is replaced if the expiration date has passed. The following inspections and tests are intended for each inspection for certification other than the initial inspection.

- a. Davit And Winch Launching Systems For Lifeboats. Including Auxiliary Launching Systems For Free-Fall Lifeboats. (See C.2.H.7 of this manual for special considerations concerning lifeboat handling equipment.)

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION****(1) Falls.**

- (a) Procedure. Inspect falls for broken strands, damaging corrosion and proper lubrication. When the boat is in the stowed position, the sections of the falls that are bent over the sheaves can be crushed and flattened making the falls more prone to damage in this area; pay particular attention to these sections of the falls prior to and during the full load test. In addition, sheaves are designed to handle wire rope of a particular diameter. Over years of use the groove of the sheave can be widened to the point that the wire rope is not properly supported in its travel and can be damaged due to flattening. Should the wire rope appear separated during the inspection, consider gauging the sheaves with a groove gauge. Since falls can not be internally inspected, one of the maintenance procedures in paragraph (c) is strongly recommended for all vessels, even if not specifically required by the regulations.
- (b) Acceptance Criteria. Falls must be properly lubricated and free of broken strands and damaging corrosion. Connections at the ends of the falls, such as clamping or socket arrangements must be properly made. All sheaves must be properly lubricated, turn freely, and not show excessive wear.
- (c) Maintenance - SOLAS Ships and MODUs. Each fall used in a launching appliance on a SOLAS ship or MODU may comply with either 46 CFR 199.190(j) or SOLAS III/20.4. A corrosion-resistant tag is recommended on each fall to record the date the new fall was installed and when it was turned end for end. Make sure the full load test in P.3.a.(3) is conducted after falls are turned or replaced.

- (2) Light Load. Operating the launching system at light load demonstrates that the mass of the boat is sufficient to overcome the frictional resistance of the winch, falls, sheaves, blocks, and associated gear. For boats with a hydrostatic lock on the release mechanism, it verifies that the lock operates at the lowest operational hydrostatic pressure. This test can generally be completed quickly, since no special loading is required for a fully equipped boat. The test is especially important on older installations to test the condition of rollers, bushings, bearings, and other rolling and sliding parts.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

(a) Procedure.

- [1] The boat should approximate its condition "A" weight for this test, with added weight of equipment and fuel on board. Precise loading and load measurement is not necessary, however. In addition, one person may be on board to operate an on-board winch brake control or the release mechanism. If additional personnel are needed to complete the test and to recover the boat, they may board when the boat reaches the water.
- [2] Release the gripes, if necessary. Tricing, frapping, and/or bowsing gear do not need to be used for this test if they are not needed.
- [3] Lower the boat by releasing the winch brake. If the winch brake is arranged for control from within the boat, a person on board the boat should operate the winch brake control.
- [4] Lowering speed does not need to be measured unless the winch and winch brake do not appear to be operating properly. (Refer to section 6.P.2.a on initial inspections for lowering speed requirements.)
- [5] Launch the boat into the water using the normal launching procedure. There are three different operational modes for approved release mechanisms, with the "normal" procedure being different for each.
 - Most 160.133 approval series release mechanisms have a hydrostatic lock which allows the hooks to be released once the boat is in the water; only lifeboats approved under approval series 160.135 and installed after January 1, 2013 will have a release mechanism with a hydrostatic interlock or some other means to ensure the lifeboat is waterborne before the release mechanism can be activated.. With the keel of the boat at or just in the water and tension on the falls, it should be verified that the hydrostatic lock prevents operation of the release mechanism. Then with the boat lowered into the water, the hydrostatic lock should open and permit operation of the release mechanism.
 - An automatic release mechanism is sometimes used on a boat or survival capsule with a single fall launching system. Once set or cocked, these devices release as soon as tension is off the fall. Set these devices for automatic operation for this test. If a person will be on board the boat as it is lowered, that person should set the release mechanism for automatic operation just before the boat reaches the water.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- On-load release mechanisms such as "Rottmer" gear can release the boat whenever the release handle is moved, whether the boat is in the water or not. Persons in command of the boat and operating this mechanism must fully understand the danger of serious injury or death resulting from premature operation. Release the boat from the falls using the on-load release mechanism control as the boat reaches the water. The keel of the boat should be at or in the water, but there should still be tension on the falls when the release mechanism is operated. The safety pin should not be removed until the boat is in position for release.

[6] Recover the boat with the winch. Anyone on board the boat should disembark when it reaches deck level. No one should be on board the boat when the weight of the davit is taken up by the winch, and the davit moves into its stowage position. This is when most fall and fall attachment failures occur.

(b) Acceptance Criteria.

[1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.

[2] The brake must be a "deadman" type, always applied unless the operator holds the control handle or mechanism in the position to lower the boat. If the operator releases the brake handle/mechanism, the handle/mechanism returns to the "stop" position, thus applying the brake and stopping the boat. No additional force is permitted.

[3] Each winch drum shall be arranged so the fall wire winds onto the drum in a level wrap. There shall be no more than one layer of wire on the drum when the davit is in stowed position, except that if the maximum fleet angle is not more than 4 degrees, two layers of wire are acceptable on a grooved drum. Winches must be demonstrated to wind the falls evenly on and off the drum, regardless of whether the drum is grooved or smooth. The fleet angle shall not exceed 8 degrees in any winch installation.

[4] For a multiple fall system, the falls must wind off the drums at the same rate when lowering. The falls must wind onto the drums evenly and at the same rate when hoisting.

[5] For launching appliances arranged for control from within the boat, there are two basic types of control. One of these types uses a control wire that pays out as the boat lowers. The control wire must properly operate the winch brake throughout the launching sequence. There must be sufficient length of control wire available inside the boat to operate the winch brake

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

until the boat is released from the falls. The other type is a "pull -and-go" system. An operator in the boat pulls a control lever or handle on the launching appliance which is accessible from a position on board the boat. Once the control is activated, it holds the brake control in the "lower" position, until a crew member on deck returns it to "stop."

- [6] The release mechanism must open all hooks simultaneously and release the boat into the water in the intended manner. The release mechanism must operate freely, without excessive force being required, and be maintained in accordance with manufacturer's instructions. Pay special attention to painting of working parts, cleaning and replacing grease (if used), condition of cables, universal joints, and overall cleanliness. Hooks that can not be operated without excessive force should not be forced.

(3) Full Load.

(a) Procedure.

- [1] The boat must be in its embarkation position. Tricing pendants, if any, must be disconnected. The boat should be held alongside the ship during loading by means of the installed frapping, and/or bowsing gear.
- [2] Load the boat so that its total weight equals the condition "B" weight shown on its data plate. Hold the boat in position for at least ten minutes and check for deformation, especially at davit and winch foundations and other load-bearing members.
- [3] Lower the boat using the normal lowering procedure, using the on-deck winch control position.
- [4] Lowering speed does not need to be measured unless the winch and winch brake do not appear to be operating properly. (Refer to section 6.P.2.a on initial inspections for lowering speed requirements.)
- [5] Alternately release and apply the brake so the boat stops at approximately 2 m (6 ft) intervals. Complete at least three start-stop cycles. The lowering operation should be carefully planned, so that the boat will not have to be raised to complete the start-stop cycles. Most winches will not be capable of raising the loaded boat.
- [6] Stop lowering just as the boat reaches the water. The keel of the boat should be at or in the water, but there should still be tension on the falls. Release the boat from the falls using the on-load release mechanism control. Release mechanisms with a hydrostatic interlock will require use

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

of the emergency override device to permit on-load release. . For lifeboats installed after January 1, 2013, the interlock override will include special mechanical protection that must be deliberately destroyed, e.g. by breaking a protective glass or translucent cover. The restoration of the release mechanism in these cases should be planned for, and may require a service technician.

[7] Unload the boat, recover it with the winch, and return it to its stowed position. Observe operation of the limit switches as the davit approaches the stowed position. Anyone on board the boat should disembark when the boat reaches deck level. No one should be on board the boat when the weight of the davit is taken up by the winch, and the davit moves into its stowage position. This is when most fall and fall attachment failures occur.

(b) Acceptance Criteria.

- [1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.
- [2] The brake must be a "deadman" type, always applied unless the operator holds the control handle or mechanism in the position to lower the boat. If the operator releases the brake handle/mechanism, the handle/mechanism returns to the "stop" position, thus applying the brake and stopping the boat. No additional force is permitted.
- [3] The action of releasing the winch brake control must bring the boat to a stop. No additional force on the winch brake control is permitted. The brake action must be smooth and positive.
- [4] Each winch drum shall be arranged so the fall wire winds onto the drum in a level wrap.
- [5] For a multiple fall system, the falls must wind off the drums at the same rate when lowering. The falls must wind onto the drums evenly and at the same rate when hoisting.
- [6] For launching appliances arranged for control from within the boat, the untended control wire must feed out properly with the boat. The winch brake operation must not be affected by the mass of the fully extended control wire.
- [7] The release mechanism must open all hooks simultaneously and release the boat into the water.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

[8] The limit switches must disconnect the winch power source 0.3 m (12 in) or more before the davit reaches its fully stowed position.

(4) Special Circumstances. Inclement weather or port conditions may force delay or alteration of the light load and full load tests, especially for MODUs on site. Inspectors should not be delayed for extended periods, waiting for weather to clear. Operators should be allowed to use alternate procedures which accomplish the intent of the tests, such as:

(a) Conduct the light load and full load tests without lowering the boats to the water and releasing them.

(b) Arrange a safety sling forward and aft on the boat. With all the slack out of the tricing pendants, release the boat onto the pendants to prove the operation of the releasing gear.

NOTE: This procedure may not be possible or safe with all launching arrangements.

(c) Operate boat engines in the stowed position or in the water without releasing them from the falls. If the engines are operated with the boat out of the water, an external source of cooling water may need to be supplied to enable extended operation.

(d) The operator should complete the tests when conditions permit. The inspector should issue a Vessel/Facility Inspection Requirements, Form CG-835 requiring completion of the tests to the satisfaction of an attending marine inspector, or alternatively requiring submission of log entries attesting to the satisfactory completion of the tests.

b. Free-Fall Lifeboat Launching Systems. Free-fall lifeboat and launching system installation tests are conducted with the vessel on an even keel. The vessel shall not be lighter than its lightest seagoing draft.

(1) Light Load.

(a) Procedure.

[1] The boat should be arranged for launching by a launching crew on board the boat.

[2] The boat should approximate its condition "A" weight for this test, with added weight of equipment and fuel on board. Precise loading and load

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

measurement is not necessary. In addition, the minimum launching crew should be on board to operate the on-board launching control.

- [3] The launching crew should launch the boat in free-fall by one of the two independent activation systems for the release mechanism which must be operated from inside the lifeboat. The boat should then be retrieved and examined with respect to the acceptance criteria below.

(b) Acceptance Criteria.

- [1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.
- [2] There shall be no deformation of or damage to any seat or seat mounting in the lifeboat.
- [3] There shall be no cracks or other structural damage to the hull of the lifeboat or any other structurally important part of lifeboat. Cracks in structural members of a free-fall lifeboat indicate that the structure must be replaced.
- [4] There shall be no cracks in non-structural members which could break loose during a free-fall launching.
- [5] The free-fall release mechanism must operate properly and release the boat from the launching appliance.
- [6] The launching system must operate smoothly, must launch the boat into the water at the intended angle, and must not show any evidence of improper operation.
- [7] The lifeboat must not show any evidence of instability or dangerous characteristics during the launching sequence. Water entry angle will normally be between 40 degrees and 70 degrees from the horizontal. The momentum of the boat should move it away from the vessel after it enters the water.
- [8] There shall be no injury to any personnel in the boat attributable to the free-fall performance of the boat.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

[9] If the inspector has reason to believe that the boat is not being launched in a safe and proper manner, the inspector may order that the test be repeated with the boat instrumented with acceleration monitoring equipment. The monitoring and analysis should be done by, or under the supervision of, an independent laboratory accepted by the Commandant (G-ENG-4) for this purpose. The test results are compared with the approval test data to determine whether or not the boat is being launched in a safe and proper manner. . See IMO Resolution MSC.81(70), Revised recommendation on testing life-saving appliances”, Part 1/6.17.

(2) Full Load.

(a) Procedure.

[1] Load each seat in the lifeboat with 75 or 82.5 kg (165 lb to 181.5 lbs) of deadweight properly secured in place to simulate the weight of one person. Only freefall lifeboats approved before July 1, 2010, should use 75 kg weights. Add additional weights to seats or equipment lockers, if necessary, to bring the total boat weight to the condition "B" weight.

[2] The launching crew should launch the boat in free-fall by one of the two independent activation systems for the release mechanism which must be operated from inside the lifeboat. The boat should then be retrieved and examined with respect to the acceptance criteria outlined for the light load test above.

- c. Davits and Winches for SOLAS Rescue Boats and Fast Rescue Boats. Test and inspect launching systems for SOLAS rescue boats in the same way as those for lifeboats under section P.3.a. The hoisting speed for a rescue boat launching appliance must be not less than 0.3 m/s (59 ft/min). If observation or rough timing of the hoisting operation indicates that this requirement may not be being met, the test in section P.2.c.(1) may need to be repeated.
- d. Launching Appliances For Davit Launched Liferrafts.

(1) Falls.

- (a) Procedure. Inspect falls for broken strands, damaging corrosion and proper lubrication. In the stowed position, the sections of the falls that are bent over the sheaves can be crushed and flattened making the falls more prone to damage in this area; pay particular attention to these sections of the falls prior to and during the full load test. In addition, sheaves are designed to handle wire rope of a particular diameter. Over years of use the groove of the sheave can be widened to the point that the wire rope is not properly supported in its

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

travel and can be damaged due to flattening. Should the wire rope appear separated during the inspection, consider gauging the sheaves with a groove gauge. Since falls can not be internally inspected, one of the maintenance procedures in Paragraph (c) is strongly recommended for all vessels, even if not specifically required by the regulations.

- (b) Acceptance Criteria. Falls must be properly lubricated and free of broken strands and damaging corrosion. Connections at the ends of the falls, such as clamping or socket arrangements must be properly made. All sheaves must be properly lubricated, turn freely, and not show excessive wear.
 - (c) Maintenance - SOLAS Ships and MODUs. Each fall used in a launching appliance on a SOLAS ship or MODU may comply with either 46 CFR 199.190(j) or SOLAS III/20.4. A corrosion-resistant tag is recommended on each fall to record the date the new fall was installed and when it was turned end for end. Make sure the full load test in Section P.3.a.(3) is conducted after falls are turned or replaced.
- (2) Light Load. Operating the launching system at light load demonstrates that the mass of the raft is sufficient to overcome the frictional resistance of the winch, falls, sheaves, blocks, and associated gear. The test is especially important on older installations to test the condition of bushings, bearings, and other rolling and sliding parts.

(a) Procedure.

- [1] Prepare a test load which can be suspended from the automatic release mechanism. The test load shall equal the weight of one of the launching station's liferafts and its equipment, plus 75 kg (165 lb) or 82.5 kg, as appropriate, simulating the weight of one person. An inflated davit-launched liferaft carrying a 75 kg or 82.5 kg weight may be used for the test load, but is not required.
- [2] Lower the test weight from the embarkation deck by releasing the winch brake, and "launch" the weight using the normal automatic release procedure. If a non-buoyant test weight is used, the weight is "launched" onto a surface that will support its weight, rather than into the water. If this is not possible, an additional test will need to be devised to test the automatic release mechanism.
- [3] Lowering speed does not need to be measured unless the winch and winch brake do not appear to be operating properly. Refer to Section P.2.d.(1) for a lowering speed test.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

[4] Recover the fall with the hand-operated quick-return mechanism.

(b) Acceptance Criteria.

[1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.

[2] The brake must always be applied unless the operator, or a mechanism activated by the operator, holds the brake control in the "off" position. The test weight must begin to lower each time the brake is released. No additional force is permitted.

[3] Each winch drum shall be arranged so the fall wire winds onto the drum in one or two level wraps.

[4] The automatic release mechanism must open and release the test weight only after the apparatus is set to open automatically and the load of the test weight is off the fall

[5] The operation of the hand-operated quick-return mechanism must be smooth, rapid, and easy enough for one person to recover the fall.

(3) Full load.

(a) Procedure.

[1] Prepare a test load which can be suspended from the automatic release mechanism. The test load shall equal:

$$1.1*(W + M*P) \quad (\text{in kg})$$

$$1.1*(W + M*P) \quad (\text{in lb})$$

where W is the weight of one of the launching station's liferafts and its equipment, M is 75 kg (165 lbs) for all passenger vessels or 82.5 kg (181.5 lbs) for all other vessels built after July 1, 2010, and P is the number of persons the liferaft is approved to accommodate. An inflated davit-launched liferaft carrying additional weight may be used for the test load, but is not required. Alternatively, the test load may be:

$$1.1*SWL$$

where SWL is the least of the three approved working loads for the davit, winch, or automatic release mechanism.

[2] Lower the test weight from the embarkation deck by releasing the winch brake.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- [3] Lowering speed does not need to be measured unless the winch and winch brake do not appear to be operating properly. Refer to section P.2.d.(2) for the lowering speed test during initial inspections.
- [4] Alternately release and apply the brake so the test weight stops at approximately 2 m (6 ft) intervals. Complete at least three start-stop cycles. The lowering operation should be carefully planned, so that the weight will not have to be raised to complete the start-stop cycles, since it may not be possible to raise the weight with the winch.
- [5] "Launch" the weight using the normal automatic release procedure. If a non-buoyant test weight is used, the weight is "launched" onto a surface that will support its weight, rather than into the water. If this is not possible, an additional test will need to be devised to test the automatic release mechanism.
- [6] Recover the fall with the hand-operated quick-return mechanism.

(b) Acceptance Criteria.

- [1] There shall be no deformation of or damage to the launching appliance or its connections to the vessel.
- [2] The brake must always be applied unless the operator, or a mechanism activated by the operator, holds the brake control in the "off" position. The test weight must begin to lower each time the brake is released. No additional force is permitted.
- [3] The action of releasing the winch brake control must reapply the brake and bring the test weight to a stop within 1 m (39 in). No additional force on the winch brake control is permitted. The brake action must be smooth and positive.
- [4] Each winch drum shall be arranged so the fall wire winds onto the drum in one or two level wraps.
- [5] The automatic release mechanism must open and release the test weight only after the apparatus is set to open automatically and the load of the test weight is off the fall.
- [6] The operation of the hand-operated quick-return mechanism must be smooth, rapid, and easy enough for one person to recover the fall.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

e. Lifeboats And SOLAS Rescue Boats.

(1) Operational test.

(a) Motor Lifeboats And SOLAS Rescue Boats. Operate each motor lifeboat and SOLAS rescue boat in the water. Conduct the following tests after engine has reached normal operating temperature.

[1] Operate the propulsion system at full speed both forward and astern.

[2] Operate each boat system, such as any powered bilge pump, or water spray system.

[3] Compare compass readings with several known bearings in different directions.

[4] Operate the emergency steering system in totally enclosed lifeboats.

(b) Hand-Propelled Lifeboats. Operate each hand-propelled lifeboat in the water for period of time sufficient to determine that it operates properly both forward and astern. Compare compass readings with several known bearings in different directions.

(c) Oar-Propelled Lifeboats. Operate each oar-propelled lifeboat in the water with a crew sufficient for each oar and the tiller. Compare compass readings with several known bearings in different directions.

(d) Acceptance Criteria.

[1] The boat and each of its systems must operate properly without overheating or being damaged.

[2] The boat must not have any evident leakage through the hull or around any through-hull fitting.

[3] If compass errors exceed 10 degrees, the compass should be adjusted using the compensating mechanism to minimize the errors. A compass deviation card should be prepared and mounted on or near the compass.

[4] In totally enclosed, fire-protected lifeboats, the water spray system sprinkler heads must operate properly and provide a uniform flow of water over the surface of the lifeboat. Hatch and glass gaskets, dogging devices, and other closures should prevent entry of water.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

(2) Air Supply System. The air supply system in gas-protected and fire-protected totally enclosed lifeboats supplies engine combustion air and breathing air when the lifeboat operates in areas of fire on the water or toxic gas atmospheres. These systems should be maintained comparably to breathing air systems used by commercial divers. See 46 CFR 197, Subpart B, and in particular, § 197.340(i) for breathing air standards. Over time, oxidation of metal compressed gas cylinders can reduce oxygen content of air to unacceptably low levels. The inspector does not need to witness the following inspections and tests, if the operator can provide records indicating appropriate air supply system servicing on an annual basis.

(a) Procedure.

- [1] Determine that the air regulator is operating properly either by discharging one or more of the air supply cylinders through the regulator, or by checking the flow rate on a test apparatus.
- [2] Either have an air sample tested for oxygen content, or empty the cylinders, and refill from an appropriate air supply. If cylinders are emptied, conduct an internal visual examination, if possible.
- [3] Check cylinders for compliance with 46 CFR 147.60, including hydrostatic testing every five years.

(b) Acceptance Criteria.

- [1] The air regulator must operate properly.
- [2] Each air supply cylinder must be fully charged and meet 46 CFR 147.60. (See air supply system placards or lifeboat manufacturer's manual for proper system pressure.)
- [3] The air supply must be suitable for breathing.

(3) Air Tank Buoyancy Units. Test each air tank buoyancy unit for air tightness.

Note: By 1965, lifeboats were no longer produced with air tanks for buoyancy. Many older lifeboats have had their air tanks filled with approved buoyant material, so that they no longer rely on air tanks for buoyancy.

(a) Procedure. Using the test nipple on the tank, apply an air pressure of 2 ft of water (610 mm of water, 0.9 psig, or 6 kPa).

(b) Acceptance Criteria. The tank must hold pressure for at least 10 minutes to be considered airtight.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (4) **Water Tanks.** Water tanks are normally used for the storage of packaged water and provisions. However, they are also intended to hold collected rain water or desalinated water. Therefore, they must be watertight. This shall be demonstrated by the air tightness test described in the preceding paragraph, or by filling them with water and watching for leaks.
- (5) **Inflated And Rigid/Inflated Rescue Boats.** Make sure that the buoyancy compartments are airtight. Once topped up, buoyancy compartments must remain firm for at least 24 hours. If a pressure check is made to determine air tightness, appropriate temperature and barometric pressure corrections must be made. Repair and maintenance of inflated rescue boats must be in accordance with the manufacturer's instructions. Repairs must be made at a servicing facility with the appropriate equipment and skills to affect repairs, except for emergency repairs carried out on board the vessel. Refer to NVIC 04-07.
- (6) **Battery Chargers** Batteries for engine starting and searchlights must have a means for recharging. Determine that the battery charging systems are functional and in accordance with 46 CFR Subchapter J.
- (7) **Survival Equipment.** Check the condition and quantity of equipment stowed in the lifeboat. (NVIC 2-92 contains guidance). If the equipment is known to have been well-maintained by the crew, this inspection may be conducted on a spot-check basis.
- (8) **Hydraulic Engine Starting Systems.** An hydraulic engine starting system can either be a required system, or an optional system. Check the list of accepted engines on the CGMIX website to determine the required engine starting system, and in some cases the hydraulic start is indicated on the lifeboat's approval certificate.
 - (a) Engines started exclusively by hydraulic systems will have two separate accumulators, either of which should be able to start the engine with a comfortable margin. A hand pump is provided to recharge accumulators in order to provide the required manual starting function. An engine-driven pump may also be provided to recharge accumulators after the engine starts.
 - (b) Optional hydraulic systems may be provided on engines that have qualified hand crank starting systems, batteries, or both. Such systems may have only one accumulator.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (c) Check the pressure in each accumulator using the installed gauge. Make sure the system will hold pressure for at least four hours without any noticeable pressure drop, and will start the engine. Make sure that the hand pump, if required, can recharge the accumulators.
- f. Inflatable Lifesaving Appliances. Check each inflatable liferaft, inflatable buoyant apparatus, inflatable Marine Evacuation System (MES), and inflatable lifejacket to determine that it has been properly inspected and serviced.
 - (1) Each inflatable liferaft, inflatable buoyant apparatus, and inflatable MES is serviced:
 - (a) At an approved servicing facility in accordance with the servicing procedure under 46 CFR Subpart 160.051, or 46 CFR Subpart 160.151, or an alternative approved servicing procedure for an MES;
 - (b) Every 12 months or not later than the next vessel inspection for certification, provided the total time since the date of the last servicing does not exceed 17 months; and
 - (c) Whenever the container of the raft is damaged, or the straps or seal broken.
 - (2) Each inflatable lifejacket is serviced in accordance with the servicing procedure under 46 CFR Subpart 160.176.
- g. Boats And Davits Not Credited As Lifesaving Equipment. Some vessels by nature of their operation, carry special boats and launching equipment in addition to those required for lifesaving purposes. Survey launches, personnel boats, workboats, and similar craft are not subject to approval as lifesaving equipment, but should be sufficiently seaworthy for the waters in which they will be used. The hull and structural components of such boats should be checked for damage and deterioration. Launching equipment for such craft is often intended only to handle an empty boat, with embarkation and debarkation taking place with the boat in the water. However, if the launching equipment results in personnel being suspended over water on wires, the launching equipment and attachments should be checked by a 10% overload test, similar to that for lifeboat and rescue boat launching appliances. After the test, the boat attachments should be visually checked for cracking and distortion. Appropriate data plates should be installed on both the winch and davit.
- h. Hydrostatic Release Units. Check each hydrostatic release unit used in an item of lifesaving equipment, including those used in certain 406 MHz satellite EPIRBs. (See NVIC 4-86 for guidelines on installation of hydrostatic release units for survival craft.)

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (1) **Conventional Hydrostatic Releases.** Conventional hydrostatic releases must be tested annually at an approved facility. Tests are recorded on an inspection tag attached to the device.
- (2) **Disposable Hydrostatic Releases.** Disposable hydrostatic releases must be marked with their expiration date using the tabs on the label. This must be done when the release is installed. Disposable releases must be replaced when the expiration date passes, normally two years from installation. If multiple dates are indicated, the earliest date is the date of expiration.
- (3) **Hidden Installations.** Some hydrostatic releases, especially those used on certain EPIRBs, can not be readily seen when the equipment is properly installed. If the servicing date or expiration date on an installed hydrostatic release can not be readily seen, a label should be applied in a location where it can easily be seen. The label should indicate that the device uses a hydrostatic release, along with its servicing or expiration date.
- (4) **Weak Links.** An important part of a float-free survival craft installation is the weak link which secures the survival craft painter to the vessel. Different weak link arrangements are used with different hydrostatic releases. The weak link arrangement must agree with the instructions of the hydrostatic release manufacturer, the survival craft manufacturer, or NVIC 1-83 in the case of life floats and buoyant apparatus.
- (5) **Satellite EPIRBs With Unapproved Releases.** The Raytheon/JRC model JQE-2A, Alden SATFIND model 406 M3, and Kannad model 406 F satellite EPIRBs include hydrostatic release mechanisms which were accepted as part of the EPIRBs. They carry no Coast Guard approval information, and must be replaced periodically as indicated in the owners manual and the replacement label on the float-free bracket.
 - i. **Ring Lifebuoys, Life Floats, And Buoyant Apparatus.** Check the covers of the ring lifebuoys, life floats, and buoyant apparatus to make sure they are intact and that buoyancy material is not exposed. Check cordage to make sure that it is good condition, and not weakened by weathering. Stowage arrangements should allow these devices to be readily cast loose, or to float free, as required by the regulations. Check painters for life floats and buoyant apparatus with the guidance in NVIC 1-83.
 - j. **Ring Lifebuoy Quick-Release Device.** A quick-release device is required for two ring lifebuoys on vessels on international voyages. The lifebuoys must have a floating electric water light and a self-activating smoke signal attached to them.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (1) Procedure. Operate each quick-release device. A self-activating smoke signal is not required for this test if a dummy device of comparable size and weight is used. A lanyard may be used to keep the ring buoy and its accessories from falling to the surface, or hitting the side of the vessel. Activation of the smoke signal, in particular, should be avoided.
 - (2) Acceptance Criteria. The quick-release device must be able to be operated from the bridge. The ring lifebuoy and its attachments must be properly released and dropped clear of the side of the vessel.
- k. Floating Electric Water Lights. Check the number and installation of each floating electric water light on board. Activate each one briefly to confirm that the battery is fresh and properly installed, and that the light is in good operating condition. Shake the light and examine the lens to make sure that no water has leaked or condensed inside. Water lights meeting 46 CFR 161.001 have not been permitted to be installed since December 31, 1971. Those installed before then may continue in service, provided that are in good condition. The original BA-23 military dry-cell batteries for these lights are no longer available. Acceptable replacements, if even still available, are general purpose no. 6 dry-cell batteries.
- l. EPIRBs and SARTs.
- (1) Test each Emergency Position Indicating Radio Beacon (EPIRB) and each Search and Rescue Radar Transponder (SART), except an EPIRB or SART in an inflatable liferaft. Use the test switch and output indicator to determine that the device is operating properly. The "TEST" switch or switch position can be used at any time, since no signal is transmitted. Avoid using the "ON" position to test an EPIRB. Note that some EPIRBs may have a "TEST/ON" position. These EPIRBs go through a test cycle before beginning to transmit an emergency signal. These EPIRBs should be switched back to the "ARMED" or "READY" position as soon as the test cycle is complete.
 - (2) Check the battery expiration date. The battery must be replaced if the expiration date has passed. The operator should be alerted to a battery which will soon expire and will need to be replaced.
- m. Lifejackets And Work Vests. Refer to NVIC 03-10. Examine each lifejacket and work vest to determine that the proper number are on board, and that each is in serviceable condition and properly marked with the name of the vessel. See NVIC 14-92 if "Extended Size" lifejackets are used. Each lifejacket and work vest not in serviceable condition is either repaired, or destroyed and removed from the vessel. If needed to keep track of devices which have been inspected, the marine inspector may mark or stamp the lifejackets and work vests to indicate that they have been inspected and passed.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

[NOTE: Some regulations may indicate that lifejackets will be stamped "passed" once they have been inspected, however, inspectors may regard this as optional unless an operator insists that the stamps be applied.]

- (1) Procedure. Check the lifejacket visually to determine its general condition. Check the envelope, tie straps, stitching, and lifting attachments. Give them a mild tug if they show signs of rot or deterioration. Other unsatisfactory conditions are excessive hardness, stiffness, lumpiness, nonresilience, dirtiness, or being oil soaked. A gentle squeeze will detect most of these conditions. In addition, check kapok inserts for water logging and mildew. Excessive compression of inserts is not required, because the natural buoyant properties of the kapok fiber provide the required buoyancy, not air in the sealed bag. Although a sealed vinyl pad covering may provide additional buoyancy, its primary purpose is to protect the kapok fibers from water logging, mildewing, and exposure to contaminants. Therefore, inspectors should not concern themselves with small leaks in kapok inserts, provided the conditions cited above are not evident.
 - (2) Acceptance Criteria. Rot, deterioration, or any other unsatisfactory condition identified in the preceding paragraph, is cause for rejection. A leaking kapok insert is acceptable unless there is evidence of moisture or oil soaking, since oil and mildew will break down the waxy kapok fibers. Likewise, if the general condition of a lifejacket is poor, its buoyancy is questionable. Representative samples should be subjected to a buoyancy test in accordance with NVIC 2-63. A lifejacket or work vest that fails to meet the required test, and is found unfit for service and beyond repair, should be destroyed in inspector's presence and removed from the vessel. Minor repairs and cleaning should be accomplished in accordance with the manufacturer's instructions, 46 CFR 160.006, or NVIC 2-63.
- n. Immersion Suits. Refer to NVIC 03-10. Examine each immersion suit to determine that the proper number are on board, and that each is in serviceable condition and properly marked with the name of the vessel. Immersion suits must have operable waterproof zippers, valves and seams which do not leak, and no unrepaired holes. Maintenance instructions are provided with each approved suit. Each immersion suit not in serviceable condition is either repaired, or destroyed and removed from the vessel. If needed to keep track of devices which have been inspected, the marine inspector may mark or stamp the immersion suits to indicate that they have been inspected and passed.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (1) Overall Inspection. Each suit should be laid out flat, inspected for proper markings, holes, separated seams, missing parts, and other obvious defects. The exterior surface of the suit should not be abraded to the point where foam flotation material is exposed. Removable gloves must be tethered to the sleeves. The suit should be completely dry inside and out.
- (2) Zippers. Zippers can corrode if not properly maintained. The manufacturer's recommended zipper lubricant should be used. Paraffin should be avoided, especially in cold climates. The teeth that actually secure the waterproof zipper are the small teeth on the "inside" of the zipper. A little corrosion on these teeth can block the slider, or damage the teeth so the zipper does not operate. If a closed zipper can be separated when probed with a (dull) table knife, the zipper needs to be replaced.
- (3) Seams. Immersion suit seams are stress points and are often the source of leaks. Suits should be leak checked periodically, and leaking seams repaired in accordance with the manufacturer's recommended repair procedure. Leak checking is most effectively accomplished by inflating the suit using an appropriate adaptor in the head of the suit. If the suit has foot valves, these need to be held shut for this test. If the suit does not retain air, a detergent solution is used to find the source of leakage. This testing does not need to be conducted at each subsequent inspection for certification, especially if the suits appear in good condition, or if records indicate that the suits have been recently leak checked. If the suits are suspect, the inspector should direct that a leak check be conducted on a selected sample of the suits on board, to determine if there is a problem.
- (4) Inflatable Collar. If a suit has an inflatable collar, it must be securely attached to the suit: It should be inflated and allowed to stand overnight. If the collar does not stay firmly inflated overnight, it should be repaired or replaced. Inflation tubes should be complete, securely attached, and not have kinks which would prevent the wearer from inflating the collar.
- (5) Foot Valves. Some suits have one-way foot valves intended to allow excess air and water to escape from the suit. Leaking foot valves are a common source of problems. These valves should be observed to be in their normal closed condition during the inspection. They should be free of debris and distortion that would adversely affect their performance.
- (6) Stowage. Each suit should be kept in a stowage bag of the type provided by the manufacturer. However, keeping the suit on an appropriate hangar in a protected, but readily accessible location is an acceptable alternative. Stowage bags should be inspected to ensure they are in satisfactory condition for the purpose of containing and protecting suits. The exterior of each bag should be marked with the size and the words "immersion suit" or "exposure suit." Suits should not be stacked more than a few high, or be kept on the bottom of a stack of any other

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

equipment. Excessive stacking can compress suits at the bottom of the pile, eventually damaging the buoyant insulating foam.

- o. Retroreflective Material. Most lifesaving equipment on inspected vessels is now required to be equipped with retroreflective material. This is normally applied by the manufacturer, but may have to be applied by the operator. See NVIC 1-87 and IMO Assembly Resolution A.658(16) for more information on placement of retroreflective material. Retroreflective material that is delaminated, torn, cracked, or discolored must be replaced. Questionable material may be checked for optical performance by examining it with a flashlight. With the flashlight held as close as possible to the observer's eye and pointed at the retroreflective material, the reflective performance of good material will be obvious. Replacement material should generally be positioned in the same place as the old material. Only Coast Guard approved retroreflective material (approval series 164.018) may be used. This material is tested for flexibility, adhesion, and optical performance under cold, wet, and oily conditions. The application directions supplied with the retroreflective material should be carefully followed.
- p. Lifejacket Lights. Except for one-use lights, such as chemiluminescent lights (chemical lights) and those with water-activated batteries, turn each light on and off to make sure it operates. The light or the power source must be marked with a date of expiration, unless it is a standard battery such as a 9-volt or D-cell. Unmarked batteries must be replaced annually and must be of the type designated by the light manufacturer. Other batteries or lights must be replaced by their expiration date. Operators of vessels operating in near-freezing waters should be aware that battery and light operation degrades in cold temperatures. In particular, chemiluminescent type lights should be avoided on vessels operating in near-freezing waters.
- q. Whistles. Lifejackets and immersion suits on vessels on international voyages must each have a whistle attached to the device with a lanyard. The lanyard must be long enough to allow the whistle to reach the mouth of the wearer. The whistle must be a ball-type or multi-tone whistle of corrosion-resistant construction. The lanyard and whistle must both be in good, operable condition.
- r. Distress Signals. Depending upon its service, the vessel may be required to carry flares or smoke signals in an appropriate stowage location in or near the pilothouse. Flares and smoke signals must be approved, of the appropriate type required by the vessel regulations in 46 CFR, and not past their expiration date.
- s. Line Throwing Appliances. Check each line-throwing appliance to make sure that it has the proper stowage arrangements, and that each dated component has not expired. Each line-throwing appliance must also have the equipment on the list provided with the approved appliance. Make sure that an auxiliary line of the correct size and length is provided, and that it is in good condition. If the logbook shows that a required test

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION

firing is due, witness a test firing - if it can be safely carried out where the inspection takes place.

- t. Pilot Ladders And Embarkation-Debarkation Ladders. Though not strictly "lifesaving equipment," pilot ladder inspections are covered here because of their similarity to embarkation-debarkation ladders. Any new pilot ladder on or after 23 July 1984 is required to be approved under approval series 163.003. Rope embarkation-debarkation ladders are approved under approval series 160.117, or are approved as equivalent to chain ladders under approval series 160.017. Rope embarkation-debarkation ladders are similar to approved pilot ladders, except that embarkation-debarkation ladders are not required to have spreader steps. Chain ladders are approved under approval series 160.017. All ladders must be a single length of ladder.
- (1) See IMO Assembly Resolution A.1045(27) for information on pilot ladder installation and other pilot transfer arrangements.
 - (2) Any embarkation-debarkation ladder installed on or after 1 July 1986 on a ship certificated for international voyages, must be a rope ladder. These ladders must extend from the deck to the waterline in the lightest seagoing condition at a 15 degrees adverse list. Any other ladder must be either an approved chain ladder or rope ladder. These ladders must extend from the deck to the waterline in the lightest seagoing condition, with no list assumed.
 - (3) The embarkation-debarkation ladder must be secured to the deck adequately, and must be ready to be deployed.
 - (4) Pilot ladders and embarkation-debarkation ladders must have no cracked or broken steps. Each step must be securely attached to the side members. A vessel may use up to two unapproved temporary replacement steps to replace broken or cracked steps. However, temporary steps will not be accepted at inspections for certification. Broken steps must be replaced by permanent approved replacement steps.
 - (5) Chains and other metal ladder parts must be free of damaging corrosion. Ropes must not be weathered, worn, or greasy. SOLAS 74/83 rope ladders have a safety core of a color which contrasts with the outer cover. If the outer cover is worn through to the core in any place, the ladder must be replaced, or the ladder roped under original manufacturing conditions. Failure to follow the proper ladder assembly procedure will result in steps which are unevenly spaced and not level.
 - (6) Approved pilot ladders and embarkation - debarkation ladders are manufactured under carefully controlled conditions, under the inspection of an independent laboratory. This assures that the ladders will be well constructed and suitable for

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

their intended purpose. Steps are assembled to the ladder at regular intervals in a safe and proper manner. Side ropes are properly straightened and tensioned, so that the steps remain level and safe to use. These ladders, especially pilot ladders, are subject to extremely hard use, and steps will occasionally be damaged. For this reason, replacement steps are also approved. These steps are white or yellow, rather than the orange of the original steps, so that they are readily apparent to anyone inspecting or using the ladder. This conspicuous marking helps draw attention to steps which have not been installed under the same careful conditions as those of the original ladder. Vessels under Coast Guard inspection may not field assemble pilot ladders and embarkation - debarkation ladders. Such ladders will not be considered to be approved, even if assembled from approved replacement steps. The same thing applies to field "reroping" of ladders - that is using original orange steps to assemble a ladder with new ropes. Ladders assembled in this fashion can not be assembled with the same care as in the manufacturer's facility. There is no objection to the manufacturer using old steps in good condition to rope a ladder under original manufacturing conditions, however.

- u. Powered Pilot Hoists. Per IMO Resolution MSC.308(88), pilot hoists may not be used on SOLAS ships after July 1, 2012.
 - v. Abandon-Ship Drill And Fire Drill. Hold an abandon-ship drill and a separate fire drill. When drills can not be held due to adverse weather conditions or other uncontrollable factors, a Form CG-835 may be issued, granting the vessel a reasonable period of time in which to conduct drills to another inspector's satisfaction. However, these drills are one of the few opportunities Coast Guard inspectors have to interact with the entire crew and to let them know of our concern for their safety. Human error is often identified as being responsible for mishaps. Deferring these drills to a later date is strongly discouraged, particularly if there has been a crew change out. There is rarely a need to defer a fire drill; lifeboat drills can be abbreviated if the weather is rough (i.e., lower the boat to the water but do not release or exercise it).
- (1) Conduct Of Drills.
- (a) Drills shall be carried out in as realistic a manner as possible. The inspector specifies the nature of the emergency to be simulated, including incapacitated officers, crew members, or injured passengers, if appropriate.
 - (b) There shall be no forewarning of the crew to the extent that fire hoses are led out, pumps started, or lifejackets donned prior to the sounding of the general alarm.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 1: INSPECTION OF VESSELS FOR CERTIFICATION**

- (c) Spot check crew members to make sure they know their stations and are familiar with their duties as contained in the station bill (muster list). The inspector does not direct or instruct personnel at any time during drills; the inspector's duty is only to observe them and note deficiencies.
 - (d) On-load release mechanisms such as "Rottmer" gear can release the boat whenever the release handle is moved, whether the boat is in the water or not. Persons in command of the boat and operating this mechanism must fully understand the danger of serious injury or death resulting from premature operation.
- (2) Fire Drills. Crew members shall demonstrate that they are familiar with fire extinguishers, fixed CO and foam systems, sprinkling systems, hoses and nozzles, steam smothering systems, and all other emergency equipment. Persons in charge shall instruct crew members in the use of the equipment as necessary.
- (3) Abandon-Ship Drills. During abandon-ship drills, care must be taken to minimize the hazards associated with the loading and unloading of the boats. Casualties have occurred because adequate safety precautions were neglected or because personnel took needless chances.
- (a) When possible, all lifeboats shall be lowered to the water.
 - (b) Crews of vessels equipped with oar-propelled lifeboats shall be exercised at rowing.
 - (c) Whenever a lifeboat is being raised, all persons in the boat should be required to disembark before the davit starts to move from its outboard position.
- (4) Acceptance Criteria.
- (a) Crew members must know their stations and be familiar with their duties as contained in the station bill (muster list).
 - (b) The officers and crew must demonstrate that the station bill and their emergency procedures can provide for substitution of key personnel, and different emergencies which may require different actions.
- (5) Unsatisfactory Results. When a drill is considered unsatisfactory, the inspector shall report the results to the OCMI. The drill should be repeated at reasonable intervals until satisfactory results are obtained. The OCMI shall consider unsatisfactory drills as justification for withdrawing or withholding the COI.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS****A. INTRODUCTION**

Vessel reinspections, annual inspections, and periodic inspections occur between those inspections required by vessel inspection laws. These focus more on the vessel's equipment and operating practices, while inspections required by vessel inspection laws focus on basic hull and machinery conditions. The scope of reinspections, annual inspections, and periodic inspections varies according to the vessel's condition, its record of maintenance, and, at times, the marine inspector's time constraints. Such inspections should verify that all parts of the vessel and its equipment are being maintained in a safe condition. They should not be perfunctory; the vessel's operator should not be able to predict their scope.

1. Scope of Reinspections, Annual Inspections, Periodic Inspections

During reinspections, annual inspections, and periodic inspections, inspectors must give special attention to lifesaving and firefighting equipment and watertight closures. The inspector should vary the degree of attention they give to individual items as circumstances require. During each reinspection, annual inspection, and periodic inspection, the inspector should inspect accessible parts of the hull and machinery that are prone to neglect and rapid deterioration. The inspector has great latitude in the scope of these inspections, which is based on his or her evaluation of the vessel's overall condition. At a minimum, the guidelines for International Convention for the Safety of Life at Sea (SOLAS) annual inspections must be used for all vessel reinspections, annual inspections, and periodic inspections (see E of this Chapter).

2. Inspector's Obligations

The inspector must be reasonably satisfied as to the condition of the vessel and its equipment, and must ascertain that the vessel's degree of compliance with statutes, regulations, and the terms of its Certificate of Inspection (COI) warrant continued possession of the COI. As conditions warrant, the inspector may conduct an inspection similar in scope to that of an inspection for certification. In any case, the scope of inspection must be consistent with the requirements found in B2 of this Chapter.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS**3. Vessel Information Sources**

The inspector must use all available evidence when appraising the condition of a vessel and its equipment. This includes the latest inspection findings, records of previous Coast Guard inspections, the opinions or records of other interested surveyors or inspectors, information furnished by the officers and crew, facts concerning the vessel's classification, and previous certification.

NOTE: See 46 U.S.C. 3315 concerning the disclosure of sources of information.

The inspector may seek the advice of experts in a particular field, such as boilermakers, shipfitters, and welders, or the opinion of more experienced inspectors or technical personnel assigned to his or her unit. Based on this evidence and his or her own inspection, the inspector must reach an independent conclusion as to vessel and equipment conditions and act accordingly. The Officer in Charge, Marine Inspection (OCMI) must be consulted when there is doubt in the inspector's mind as to a proper course of action.

4. Commandant's Reinspection Policy

The Commandant's policy regarding reinspections, annual inspections, and periodic inspections does not restrict an OCMI from requiring reinspection at any time when the OCMI believes that a vessel's degree of compliance no longer warrants continued possession of a COI. However, the OCMI should not require or encourage arbitrary and unnecessary reinspection.

Minor defects or imperfections that do not in themselves hazard the vessel must not be construed as rendering the vessel unfit for continued operation. Vessel owners must be granted reasonable time to correct deficiencies.

B. REFERENCES**1. Statutes**

Under 46 U.S.C. 3308, all vessels subject to inspections at frequencies specified by 46 U.S.C. 3307 must be examined at proper times to ensure compliance with statutory and regulatory requirements. Under 46 U.S.C. 3714, tank vessels that carry liquid bulk dangerous cargoes must be examined at least once annually. 43 U.S.C. 1348 requires annual inspection of mobile offshore drilling units (MODUs) operating on the U.S. Outer Continental Shelf (OCS).

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS**2. Regulations**

46 CFR 2.01-10(b) provides that the Coast Guard, on its own initiative, may examine, inspect, or reinspect vessels subject to certification at any time. The following regulations require reinspections, annual inspections, and periodic inspections of certificated vessels at stated intervals and establish the scope of such inspections.

VESSEL TYPE	CFR CITATION
Tank Vessels	46 CFR 31.10-17
Passenger Vessels	46 CFR 71.30
Cargo and Miscellaneous Vessels	46 CFR 91.27
Small Passenger Vessels	46 CFR 176.500 (Sub T) 46 CFR 115.500 (Sub K)
Oceanographic Research Vessels	46 CFR 189.27

3. SOLAS Survey Requirements

Regulation 6(b), Chapter 1 of the 1978 Safety of Life at Sea (SOLAS) Protocol requires annual surveys of all cargo and tank vessels issued Cargo Ship Safety Construction Certificates (SAFCON) and Cargo Ship Safety Equipment Certificates (SEC). International Maritime Organization (IMO) Resolution A.413(XI), as amended by Resolution A.465(XII), provides an excellent, internationally accepted standard for conducting surveys.

C. REINSPECTIONS OF PASSENGER VESSELS**1. Large Passenger Vessels (46 CFR Subchapters K and H)**

Reinspections of passenger vessels holding 1-year COIs (certificated under 46 CFR, Subchapter H or K) must be conducted at the discretion of the OCMI. For such vessels, an examination of safety and operating equipment as well as all accessible parts of the hull and machinery that are most prone to neglect or damage must be carried out to the satisfaction of the inspector. Conditions that in themselves do not hazard the vessel, but indicate generally poor condition, should alert the inspector to broaden the scope of the reinspection (see 46 CFR 71.30 for Subchapter H or 46 CFR 115.500 for Subchapter K).

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS****2. Small Passenger Vessels ("T-Boats")**

The scope of annual inspections of small passenger vessels, which hold 5-year COIs under 46 CFR Subchapter T, is described in 46 CFR 176.500 (b). The OCMI must cooperate with vessel owners and operators when scheduling inspections in order to interfere as little as possible with the normal vessel operations. For the inspection of a T-boat with a COI issued in another zone, the OCMI should obtain the vessel's previous inspection records from the certificating OCMI. In such cases, the next OCMI inspecting the vessel should resolve any questions concerning the vessel's structure or equipment with the certificating OCMI before issuing major requirements as a result of the inspection.

NOTE: Steam powered T-boats require special consideration for the inspection of their boilers.

D. ANNUAL INSPECTIONS, PERIODIC INSPECTIONS, AND REINSPECTIONS OF TANK, CARGO, AND MISCELLANEOUS VESSELS

1. Introduction

Each tank, cargo, miscellaneous vessel and MODU holding a 5-year COI is subject to annual and periodic inspections as outlined in the applicable 46 CFR subchapter. If a vessel has SOLAS certificates, the annual and periodic inspections meet the SOLAS mandatory annual survey requirements (See MSM Volume II, Materiel Inspection, COMDTINST M16000.7A (series), Section E). Annual and periodic inspections, must, if possible, be carried out between the 9th and 15th months following the date of issuance of the COI. In addition to this requirement, an annual or periodic inspection should normally coincide with a drydock examination, unless the owner or master requests a deferment.

2. Timing

If a vessel's drydock examination occurs outside the window for an annual or periodic inspection, it will need to have a reinspection. This reinspection's scope should vary depending on the time of the vessel's drydocking relative to the date of the previous or next required inspection. For example, a drydocking that occurs shortly after the inspection for certification should have a reinspection that is very limited in scope. Likewise, a reinspection associated with a drydock that occurs shortly before the expiration of a COI should not duplicate the scope of an inspection for certification, but must be sufficient to ensure safe operation of the vessel.

3. Standards for Annual Inspections, Periodic Inspections, and Reinspections

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS**

These types of inspections are normally less detailed than the inspection for certification. However, they must still be sufficient to verify that the vessel's condition and operation remain satisfactory and that the vessel can continue to operate safely. The inspector must inspect all accessible parts of the hull and machinery, especially those prone to rapid deterioration and neglect. The inspector must give particular attention to lifesaving, firefighting and watertight equipment. Equipment and devices for vessel control must be tested and emergency drills held, if practicable.

Annual and periodic inspections required by 46 CFR 91.27, as described in this part of the MSM, are mandatory. The continued validity of a vessel's COI depends on the satisfaction of this requirement. These inspections may be conducted within the United States or at a foreign port or place. When an owner/operator chooses to have the inspection conducted at a foreign port or place, they will be responsible for reimbursement for the inspector's travel and subsistence.

At the 1-year anniversary of the vessel's COI, the certificating OCMI should issue a letter to the vessel's operator advising that the required inspection is due. Annual and periodic inspections are due no later than the 15-month anniversary date of the COI's issuance. If, after the 15-month anniversary date of the COI, the inspection has not commenced, been completed, or been deferred, the owner and operator will be advised that the vessel's COI is suspended under the authority of 46 U.S.C. 3313(b)(4) until the required inspection is completed. This notification will be made by letter and telephone/FAX and an appropriate entry will be made in MISLE and the local vessel file.

Requests for deferment of inspection beyond the 15th month of the COI anniversary date will be closely evaluated by the cognizant OCMI. Examples of situations in which deferments may be granted include rescheduling to make concurrent inspections ("harmonize" inspections) or the unavailability of inspection personnel.

4. RIN Alternative Provisions for Offshore Supply Vessels

The RIN Alternative Provisions for Offshore Supply Vessels (OSVs) is an alternative inspection program for OSVs under 400 GT operating overseas. This program allows owners/operators or designated third parties to perform an alternative mid-period examination and submit a report to the cognizant OCMI in lieu of having a marine inspector travel overseas to perform a mid-period reinspection. Liftboats are excluded from the program. The program does not delegate inspection duties to any private party.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS

- a. When aboard any OSV under 400 GT, except liftboats, marine inspectors should be aware that an OCMI may have to determine, at a later date, whether the vessel should be allowed to participate in the program. If the vessel previously participated in the alternative program, the inspector should pay close attention to deficiencies which may have existed before the mid-period, but were not corrected.
- b. When deficiencies are reported in the alternative examination report which is accepted in lieu of a Coast Guard mid-period reinspection, they should be entered into MSIS and tracked in the normal manner. The OCMI must establish compliance deadlines for outstanding deficiency items or approve those proposed by the owner/operator. The OCMI may determine the report is so deficient that a Coast Guard mid-period reinspection is required. The owner/operator must be informed, and a time limit for scheduling the mid-period reinspection specified.

E. ADMINISTRATION OF ANNUAL INSPECTIONS, PERIODIC INSPECTIONS, AND REINSPECTIONS

1. Actions by the OCMI

The OCMI must control inspections of all vessels certificated in their zone, insofar as practicable, and ensure that other vessels in their zone are inspected, as appropriate.

NOTE: This does not mean that a vessel certificated in one zone must be inspected there.

The continued validity of a vessel's COI is contingent upon the satisfaction of the annual, periodic and reinspection requirements. For those vessels that are issued a 5-year COI, the following procedures are applicable to ensure compliance with the requirements:

- a. Notification. Prior to each anniversary year of the COI, the certificating OCMI should issue a letter to the vessel's owner or operator advising that the required inspection is due. This notification is performed as a matter of courtesy and does not affect the responsibility of the owner/operator to comply with the inspection requirements.
- b. Deferments. In the event that an owner/operator requests deferment of the required inspection past the 15th month of the COI's anniversary date, the OCMI will evaluate the request and, if found justified, grant a deferment.
 - (1) Requests for deferments past the 15th month should be closely evaluated. Failure of an owner/operator to plan and schedule an inspection is not sufficient justification for a deferment.

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS

- (2) If a deferment is granted, the owner/operator should be issued a requirement (either a Vessel/Facility Inspection Requirements, Form CG-835 or letter) to complete the inspection within a specified length of time which must not exceed the 17th month of the COI's anniversary date.

NOTE: These actions are applicable to small passenger vessels.

2. Actions by Owners, Operators, and Masters

- a. The regulations require annual inspections, periodic inspections, and reinspections of certain vessels each year between the 9th and 15th month after the COI's anniversary date (the anniversary of the date the COI was issued). (See Paragraph B2 above for citations.)
 - (1) It is the responsibility of the owner and operator to arrange for inspection before the end of the 15th month or, when that is not possible, to obtain a deferment from the OCMI. Failure to do so subjects the owner, operator, and others to civil penalty liability.
 - (2) The OCMI must cooperate, insofar as practicable, with owners and operators to schedule inspections to avoid conflict with vessel operating schedules. Deferment requests that have merit should be granted when the required inspection can be accomplished at a later time provided it is conducted as noted above before expiration of the COI.
 - (3) Written applications for annual inspections, periodic inspections, and reinspections are not required.
- b. Responsibilities. Vessel representatives of tank, cargo, miscellaneous, and inspected oceanographic research vessels must be advised of items that the regulations require to be inspected, serviced, or replaced at certain intervals.
 - (1) The vessel owner is responsible to ensure that required inspections and tests are held when due (e.g., hydrostatic tests of boilers and inspections of boiler mountings). If they are not held when due, the owner may be subject to a marine violation, civil penalties, and possible revocation of the vessel's COI.
 - (2) The benefits of conducting these tests and inspections at regular inspection intervals should be obvious to owners. Unexpected changes to a vessel's schedule may compel an owner to depart from this desired practice. In doing so, an owner

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS**

does not become immediately liable for a penalty, but incurs the inconvenience of having to be inspected at a later time.

- (3) The vessel's representative must be reminded of the responsibility to replace or service vessel equipment at or prior to the due date (see 46 CFR 31.10-18, 97.15-60, and 196.15-60).

F. RECORDS OF ANNUAL INSPECTIONS, PERIODIC INSPECTIONS, AND REINSPECTIONS

1. COI

Annual inspections, periodic inspections, and reinspections must be recorded on the COI in the space provided.

If the vessel has SOLAS certificates, the mandatory annual survey endorsement on the reverse of the SEC and the SAFCON (if issued) must also be completed by the OCMI or an authorized representative.

2. Vessel Inspection Record, Form CG-2832

An entry noting the type of inspection completed must be made on Vessel Inspection Record, Form CG-2832, which is kept in the vessel's pilothouse.

3. Inspection Book Series, Form CG-840

The inspector must record all reinspections in the appropriate Inspection Book Series, Form CG-840. When a reinspection is of lesser scope (e.g., correcting specific discrepancies), the inspector may use a local examination form developed by the OCMI to note the circumstances of the reinspection for local office records. When reinspection of a tank, cargo, miscellaneous, or oceanographic research vessel is performed in conjunction with a drydocking, but is not of the scope of a mid-period reinspection, it may be recorded in booklet Inspection Book, Form CG-840, at the OCMI's discretion. The entry "Limited reinspection indicates satisfactory condition" will serve the purpose in such cases.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 2: VESSEL REINSPECTIONS, ANNUAL INSPECTIONS, AND PERIODIC INSPECTIONS****4. Marine Information for Safety and Law Enforcement (MISLE) Entries**

Units must make appropriate entries for all annual inspections, periodic inspections, and reinspections.

G. CRITICAL AREAS INSPECTION PLAN (CAIP) SURVEYS

General Surveys required as a part of a vessel's CAIP must be conducted as outlined in NVIC 15-91, NVIC 15-91, Change 1 and MSM II, Materiel Inspection, COMDTINST M16000.7A (series), Chapters A5 and B4.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 3: HULL EXAMINATIONS

A. HULL EXAMINATIONS

1. Introduction

The final rule implementing the revised drydock and tailshaft regulations established three separate, required examinations of a vessel's hull; Drydock Examination (DE), Internal Structural Examination (ISE), and Cargo Tank Internal Examination (CTIE). (*Federal Register*, Vol. 53, August 24, 1988.)

These exams replace the all-inclusive examination previously referred to as a "drydock" exam. The definition, scope, and interval of each exam are specified in the applicable sections of 46 CFR.

NOTE: The revised drydock and tailshaft regulations do not apply to 46 CFR Subchapter T and Subchapter IA vessels.

NOTE: Credit for the exam must be given on the date that all the requirements of the exam are met, not on the date the exam began.

2. Hull Exam Intervals

For the majority of oceangoing vessels, the intervals for all DE, ISE, and CTIE examinations are the same, i.e., twice within any 5-year period with no more than 3 years between any two exams. For most other vessels, all three exams will coincide several times during the life of the vessel, affording Coast Guard marine inspectors the opportunity to conduct a complete assessment of the vessel's hull structure.

The three distinct examinations also allow the Coast Guard to account for the additional levels of safety inherent in specific vessel designs, such as a double hull tank barge with internally framed cargo tanks in fresh water service. These vessels have a 10-year DE interval and 5-year CTIE and ISE intervals.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS****3. Concurrent Hull Examinations**

Hull examination intervals, particularly those that fall between year 2 and year 3 of a 5-year interval, should result in these examinations coinciding with an inspection for certification, annual inspection, periodic inspection, reinspection, or, in the case of tailshafts, a DE. This is ideal but not mandatory.

If a vessel owner elects to conduct any of the hull examinations early, then he or she should be advised that any other hull examination due at the same time should also be conducted early.

The owner or master may, if operational commitments do not permit all hull examinations being completed together, decide to schedule an exam at a later date, provided that the exam is accomplished within the maximum time interval allowed by the regulations.

4. Extension of Hull Exams

- a. Extensions of hull examinations. Hull examinations must be conducted in accordance with the applicable regulations, except in instances where extensions are authorized.
 - (1) A vessel owner or operator must submit any request for an extension of a hull exam to the cognizant OCMI.
 - (2) To avoid unwarranted extension requests, OCMI should ensure that owners and operators are aware that Commandant (CG-CVC) only grants DE extensions in the most unusual circumstances. Examples of unusual circumstances are the sudden unavailability of drydock space (e.g., due to high river stage, weather damage to facilities, or of the scheduled drydock facility going out of business), the employment of the vessel where it cannot be replaced without risk, or circumstances clearly beyond the owner's control. Financial hardship alone is not a valid reason for granting a drydock extension.
- b. Action following receipt of an extension request. Upon receipt of a request for extension of any hull examination, the OCMI should ascertain the condition of the vessel in question. A visit to the vessel is necessary in all but the most unusual circumstances.
 - (1) Prior to this visit, the inspector should query MISLE for any information on the vessel and pay special attention to any outstanding requirements or casualty information that is available.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 3: HULL EXAMINATIONS

- (2) While aboard the vessel, the inspector should interview the chief engineer and/or the master, as appropriate depending upon the class of vessel, to obtain their opinions on the condition of the vessel's hull, tailshaft(s), and associated machinery. In addition, the inspector must obtain a written statement from the chief engineer, master, or both, attesting that the vessel is in suitable condition for operation during the period of extension requested.
- (3) The inspector should then examine the vessel to the extent necessary to ensure that the condition of the vessel is, in his or her opinion, satisfactory for the extension requested and does not contradict the opinion of the master or chief engineer. The inspector should also examine the vessel's bridge record card, if applicable, for any deficiencies that may have been issued recently by another port and not yet entered into MISLE.

NOTE: The requirement for a written statement is in addition to the owner's written request for DE extension.

- c. Additional considerations for extension. A request for an extension of a hull exam must include an inspection of the vessel and also take into consideration other U.S., international, and class requirements. Any conflicts with other requirements must be resolved before an extension request is forwarded to Commandant (CG-CVC) or granted by the OCMI per Subparagraph A.4.d of this Chapter.
 - (1) International Convention for the Safety of Life at Sea (SOLAS). SOLAS requires an examination of the outside of a ship's bottom every 12 months on passenger vessels and at intervals not to exceed 5 years on all tankers. In addition, SOLAS requires that tankships 10 years of age and older undergo an examination of the outside of the ship's bottom at the required intermediate survey, which may take place between 6 months before and 6 months after the midpoint of the period of validity of the Cargo Ship Safety Construction Certificate. A Cargo Ship Safety Construction Certificate must not be extended beyond 5 years.
 - (2) Load Line Regulations (46 CFR Part 42). The Load Line regulations require a vessel to be drydocked before issuance of a new Load Line Certificate and then every 5 years thereafter. An existing Load Line Certificate may be extended up to 150 days maximum, except for those vessels with Great Lakes Load Line Certificates, which can be extended for up to 365 days. (Until MSM Volume IV, Technical, COMDTINST M16000.9 (series) is updated; see MSM Volume II, Mechanical Inspection, COMDTINST M16000.7A (series), Chapter E4 for policy on load line extensions.)

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

- (3) Tailshaft examination. The tailshaft examination requirements of 46 CFR 61.20-17 through 61.20-23 and D of this chapter provide regulatory and policy guidance on tailshaft examinations. A tailshaft examination extension may also require consideration if a drydock examination extension will delay the tailshaft exam.
- d. Delegation of extension authority. The Commandant has delegated limited authority to extend hull examination intervals for certain specific vessels to OCMI's and district commanders, as follows:
- (1) Tank barges, not gas freed and not in service. Under current industry needs, a large number of not gas-freed tank barges with current COI's have been laid-up for indefinite periods of time. The OCMI is authorized to grant consecutive 12-month extensions of hull examinations for laid-up tank barges, not to exceed a total of 4 years from the original drydock due date. Each extension must be subject to the following:
- (a) The barge must maintain a valid COI, including annual and periodic inspections.
 - (b) In addition to meeting the requirements of 46 CFR 35.05-15, the barge must be boarded and checked for damage and/or cargo tank integrity at least once a week by an owner's representative.
 - (c) A Vessel/Facility Inspection Requirements, Form CG-835 must be issued requiring the barge to undergo all required hull examinations prior to being placed in service, with an expiration date to coincide with the expiration date of the COI.
 - (d) At the end of the fourth lay-up extension, the barge must undergo all required hull examinations and associated repairs made, or its COI must be surrendered.

NOTE: The barge must be gas free prior to the surrender of the COI.

- (2) Extension of the CTIE (gravity tanks only) and ISE.
- (a) At the vessel owner's request, OCMI's may grant two 12-month extensions to all vessels that require these exams to effect coincidence with a regularly scheduled DE.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

- [1] In most cases, 24 months should be a sufficient period of time to attain alignment. If a gap of more than 24 months exists between the next CTIE, ISE, and DE due dates, then an effort should be made to conduct either the CTIE or the ISE, or both, early to align them with the DE interval.
- [2] Prior to granting an extension, an external exam should be made of the barge, including an exam from topside of all wing voids and rakes. This exam should be of sufficient scope that the OCMI is satisfied that the CTIE and ISE can be delayed for 12 months.
- (b) Once harmonization of the DE, CTIE, and ISE intervals is achieved, further extensions of the CTIE and ISE longer than 3 months should not be necessary and should not be considered, except in those cases where unusual circumstances exist, e.g., those beyond the control of the owner.
- (c) When an exam is completed following a 3-month extension, the examination completion/credit date must be back-dated to its original due date in order to keep future hull exams in phase with the DE interval.
- (3) For vessels subject to 46 CFR Part 151 with gravity tanks carrying those products with a "G" in the last column of 46 CFR Table 151.05, the cargo tank internal inspection intervals in 46 CFR 151.04-5(b)(1) and (2) and the cargo tank external inspection interval in 46 CFR 151.04-5(c) may be extended as follows:
- (a) The 2-year cargo tank internal inspection interval for single hull barges and internally framed gravity tanks on double hull barges in 46 CFR 151.04-5(b)(1), and the 4-year cargo tank internal inspection interval for externally framed gravity tanks in 46 CFR 151.04-5(b)(2), may be extended to coincide with the appropriate CTIE interval specified in the tables in the applicable 46 CFR Paragraphs; 46 CFR 31.10-21(a), 31.10-21(b), 91.40-3(a), and Table 91.40-3(b), as appropriate.
- (b) The 2-year cargo tank external inspection interval in 46 CFR 151.04-5(c) (applicable to single hull, internally and externally framed double hull tank barges, and single hull barges with independent tanks) may be extended to coincide with the appropriate ISE interval specified in the tables in the applicable 46 CFR Paragraphs; 46 CFR 31.10-21(a), 31.10-21(b), 91.40-3(a), and Table 91.40-3(b).
- (c) The guidance in Subparagraph A.4.d(2) above is also applicable to these tanks carrying "G" products.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

NOTE: This cargo tank internal and external exam extension authority is only applicable to those products carried in gravity tanks for which 46 CFR Table 151.05 refers to 46 CFR 151.04-5(b) for CTIE intervals (those products carried in gravity tanks with a "G" in the last column of 46 CFR Table 151.05).

- (4) Externally framed cargo tanks on double hull tank barges. OCMIs are provisionally authorized to extend the CTIE intervals from 5 to 10 years on double hull barges that are externally framed with the exception of the deck (see the definition for externally framed cargo tanks in Subparagraph B.6.d.(2) of this Chapter). OCMIs must report to Commandant (CG-CVC) any significant findings regarding under deck framing in both externally framed tanks examined at the 10-year interval, when authorized, and internally framed tanks examined at the 5-year interval.
- (5) Fuel oil tank examinations. Fuel oil tank examinations are required at 5-year intervals during an ISE. If an ISE extension is granted per subparagraph A.4.d(2) above, the fuel oil tank exam should likewise be extended.
- (6) Small passenger vessels. OCMIs may grant DE extensions for T-Boats for a period up to a maximum of 1 year once applicable procedures under subparagraph MSM Volume II, Material Inspection, COMDTINST M16000.7A (series), B3.A.4.b above have been met.
- (7) DE extensions for mobile offshore drilling units (MODUs).
 - (a) Upon completion of the procedures in subparagraph A.4.b above, OCMIs may grant DE extensions for a period of up to 6 months, and district commanders may grant a second 6-month extension. The maximum period of time that a DE interval may be extended is 12 months.
 - (b) MODUS in layup. District Commanders may grant extensions of exam intervals beyond 3 years for laid-up MODUs, provided that the MODU maintains a current COI and its owner or operator submits a letter attesting to the MODU's safe condition.

[1] A Vessel/Facility Inspection Requirements, Form CG-835 should be issued to extend the DE and/or special underwater intervals until the MODU either returns to service or the COI expires. In no case should the expiration of the Vessel/Facility Inspection Requirements, Form CG-835 be beyond the expiration of the COI.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 3: HULL EXAMINATIONS

[2] A deficiency letter must be sent to the vessel owner to require completion of the appropriate exam prior to the vessel returning to service or renewing the COI, whichever occurs first.

- (8) Great Lakes vessels. The Commander, Ninth Coast Guard District, is authorized to grant DE extensions for Great Lakes vessels under the following guidelines:
- (a) Extensions must not exceed 365 days.
 - (b) Extensions should be considered on a ship-by-ship basis and will be based on the results of a non-credit ISE, the extent of which should be to the satisfaction of the Commander, Ninth Coast Guard District.
 - (c) The Great Lakes load line assignment authority has been notified and there are no outstanding conditions that would impact the decision for the extension.
- (9) Inland passenger vessel special drydock extension criteria. Drydock extensions of up to 30 months are available to inland passenger vessels that operate on restricted routes in a benign environment. Such extensions require the vessel to successfully complete a special drydock extension survey. The survey criteria outlined below is similar to the traditional underwater survey program presented in Navigation and Vessel Inspection Circular (NVIC) 1-89 with the exception that it is more detailed and comprehensive.
- (a) Eligibility criteria.
 - [1] Any passenger vessel (inspected under 46 CFR Subchapter H, K, or T) that requests a drydock extension beyond 1 year must meet the following criteria:
 - aa. The vessel must be constructed of steel or aluminum. Wood and FRP hulls are excluded from eligibility.
 - bb. The vessel must have operated exclusively in fresh water since its last drydock examination. (To further clarify, this means year-round operation in fresh water.)
 - cc. Vessel operation must be restricted to rivers or protected lakes. This restriction must be indicated on the vessel's COI. The definition of a protected lake will be left to OCMI discretion.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

dd. The vessel must operate exclusively in shallow water or within 0.5 nm from shore. For shallow water operation, the maximum water depth may be defined as the depth at which, if the vessel sinks, the uppermost deck(s) that could safely accommodate all passengers and crew remains above water. To make this determination, vessel stability (passenger heeling moment) must be considered.

NOTE: Water clarity is not included as a condition of eligibility. If water clarity is a problem, then the use of a clear box of at least 18 inches in diameter must be used for the underwater video.

[2] The cognizant OCMI will determine eligibility for drydock extensions. In addition to the above criteria, decisions of acceptability will be based on the following:

- aa. The overall condition of the vessel (based on inspection history) and the hull protection system (cathodic protection is required, as a minimum).
- bb. The vessel's history of casualties involving the hull and other hull-related deficiencies.
- cc. Review of the written extension request.

NOTE: Although a vessel age limitation has not been included as a criterion, the OCMI must consider the impact of vessel age on the overall condition of the hull when determining vessel eligibility.

[3] Unlike the traditional underwater survey program, a pre-survey drydocking is not required. Permanent hull markings, hinged sea chest grates, and reference videos are optional.

(b) Drydock extension applications. The information required for the drydock extension application is identical to the requirements for the traditional underwater survey program (see Section 2 of End. (1) to NVIC 1-89), with the following exceptions:

[1] Hull maintenance and condition assessment program. The extension request must include a hull maintenance and condition assessment program which must, as a minimum, contain the following:

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

- aa. A preventative maintenance plan for the vessel's hull and related systems/equipment. A preventative maintenance plan should consider the following:
- (i) Inspection and replacement (as needed) of zinc anodes.
 - (ii) Inspection and cleaning (as needed) of the underwater hull.
 - (iii) Inspection and maintenance of rudder and shaft seals.
 - (iv) Inspection and operational testing of sea valves.
 - (v) Flushing of sea chests and sea strainers.
- bb. Provisions for an annual condition assessment of the hull in the presence of a third party examiner.
- (i) The third party examiner should be a qualified marine surveyor (recognized by a national marine surveyor association) or have prior experience as a Coast Guard marine inspector or classification society surveyor. As a minimum, the third-party examiner should have at least 3 years experience in the examination of steel or aluminum-hulled vessels.
 - (ii) The OCMI has the discretionary authority to accept or deny the use of a particular third party examiner and may, as an option, require the presence of a marine inspector. The condition assessment plan should include the following:
 - (aa) Evaluation of the vessel's underwater hull and appurtenances (using qualified divers and appropriate video equipment). This is primarily to verify that hull coatings remain intact and check for fouling of hull appurtenances. This can also be used as an opportunity for preventative maintenance.
 - (bb) Hull gaugings (representative sampling) of suspect areas.
 - (cc) A mechanism for providing a written hull assessment and preventative maintenance report or checklist to the cognizant OCMI on an annual basis.

[2] Internal structural examination. A thorough ISE must be conducted during the survey. All internal spaces must be made accessible for examination and gas-freed as appropriate. However, integral fuel oil tanks must be

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 3: HULL EXAMINATIONS

examined as required by 46 CFR 71.53, 115.610, or 176.610 (as applicable).

[3] Vessels of 15 years of age or older. Vessels 15 years of age or older are eligible for drydock extensions under this policy.

(c) Preparatory meeting. Before conducting the drydock extension survey, a preparatory meeting must be held. See Section 4 of Encl. (1) to NVIC 1-89 for details.

(d) Survey criteria. The drydock extension survey must be conducted in accordance with Section 5 of End (1) to NVIC 1-89, with the following additions or modifications:

[1] Duration of the drydock extension survey. The survey should take as long as the inspector considers necessary to ensure that the ship is in a safe condition to continue operation for the next 30 months. At least 5 days should be allowed to conduct the examination. However, with use of a third party examiner, the marine inspector's time on-site may be reduced. With the exception of those portions of the survey that require marine inspector presence, the duration and scope of participation by a marine inspector must be subject to OCMI discretion.

[2] Site selection. The site must be in an area with sufficient water depth under the keel and sufficient clearance adjacent to both sides of the vessel to allow the diver to safely survey the entire underwater hull of the ship. Current velocity must be minimal to ensure diver safety. If air temperatures are below freezing, dive equipment must be designed for use in sub-freezing conditions. Diving should not take place when ice exists on the water surface.

NOTE: Water clarity is not a great concern because use of a "clear box" will enable a clear, albeit limited, view of the hull regardless of water conditions.

[3] Hull markings. If permanent hull markings required by NVIC 1-89 are not in place, a temporary underwater grid system must be used. The temporary grid system must consist of stainless or galvanized steel cables, spaced not more than 10 feet apart, with sequentially numbered tags spaced at 1-foot intervals. The grid system must remain in place during the entire survey.

[4] Preliminary examination. Prior to holding the preparatory meeting as noted in Section 3 of NVIC 01-89, a third-party examiner (acceptable to the OCMI) together with qualified divers must conduct a preliminary

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

examination of the hull. The preliminary examination must be used to assess the overall condition of the vessel hull and identify specific concerns that should be addressed. A marine inspector does not need to be present during this portion of the survey process.

[5] Underwater inspection. A complete underwater hull examination (as defined below) must be supervised by the third-party examiner and recorded on videotape. The third-party examiner will identify areas requiring further examination by a marine inspector. The videotape will be indexed to enable the marine inspector to readily identify and review important sections of the tape.

- aa. As a minimum, the underwater survey must include a general examination of the hull plating and a detailed examination of all hull welds, propeller, rudder, other hull appurtenances, sea chests, and sea valves. As a guide, examination of the hull plating should cover all welds and at least five points on each plate, evenly spaced, where ultrasonic gaugings will be taken. The plugging of sea chests and gauging of rudder and tailshaft bearings must also be recorded on videotape. The attending marine inspector may require a detailed examination of other areas of the hull as deemed necessary.
- bb. In addition to the above gaugings, divers must take belt gaugings at the bow, stern, and midships and along the wind and water strake. The number and exact location of belt gaugings will be subject to OCMI discretion.
- cc. A Coast Guard marine inspector must be present during critical portions of the underwater survey process. Critical portions include, as a minimum:
 - (i) Examination of critical welds (identified at preparatory meeting), propeller, rudder, other hull appurtenances, sea chests, and sea valves.
 - (ii) Plugging sea chests and removal of sea valves.
 - (iii) Gauging of rudder and tailshaft bearings.
 - (iv) Any other portions identified by the OCMI.
- dd. Sea valves must be removed and examined in accordance with the guidance in NVIC 1-89. The OCMI must be completely satisfied that

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

sea valves can be removed safely. Passengers must be removed from the vessel during this evolution.

ee. This special drydock extension program is an option that the vessel's owner/operator has elected to use. Responsibility for the management of the vessel, its personnel, and maintenance of necessary safety and service systems remains at all times with the master and owner/operator.

ff. The vessel owner must provide the OCMI with a detailed examination report, including a gauging report, bearing clearances, and a copy of the videotape.

[6] Underwater inspection techniques and equipment. Underwater inspection techniques and equipment must be in accordance with Section 5 of Encl. (1) to NVIC 1-89. If water visibility will affect the quality of the underwater video, the video camera must incorporate use of a "clear box."

aa. A clear box is a device which uses clean, fresh water to displace the surrounding water and provide a clear view for the camera. In order to provide an adequate field of view, the clear box must measure at least 18 inches in diameter (or, if rectangular, at least 18 inches in height and width).

bb. As a general rule, modern video and audio equipment must be used to assure the best quality results.

[7] Internal Structural Examination (ISE) and integral fuel oil tank examination. A complete ISE must be conducted as part of the drydock extension survey. All internal areas of the hull must be accessible for examination.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

aa. The marine inspector must conduct the entire ISE. The third-party examiner or a suitable representative will accompany the inspector to take additional hull gaugings. The extent of internal gaugings should be limited to that necessary to confirm the information gathered during the underwater survey.

bb. Integral fuel oil tanks must be examined as required by B.5 of this Chapter and 46 CFR 71.53, 115.610, or 176.610 (as applicable).

[8] Acceptable underwater repairs. The acceptance of underwater repair proposals and the actual repairs is subject to OCMI discretion.

aa. Repairs using underwater welding must be subject to periodic reevaluation at subsequent inspections. Such repairs must be completed in accordance with the standards found in the American Welding Society's "Specifications for Underwater Welding."

bb. The OCMI may require immediate drydocking of the vessel if an underwater repair proposal or the actual repairs are considered unsatisfactory.

[9] Evaluating results of the survey. The OCMI may require drydocking of the vessel at any time if not satisfied with the results of the drydock extension survey.

[10] Administrative procedure. If fully satisfied with results of the survey, the attending marine inspector may recommend a drydock extension of up to 30 months.

aa. The drydock extension policy in A.4 of this Chapter must be followed for administrative purposes. Based on results of the survey, the OCMI may recommend a drydock extension of up to 30 months.

bb. Each completed application and survey, with the OCMI's recommendation, must be forwarded to Commandant (CG-CVC), via District, for action. Commandant (CG-CVC) has final approval authority for drydock extensions submitted in accordance with this policy.

[11] Tank vessels, tank barges, and freight vessels. District Commanders may grant DE interval extensions for these vessels under the following guidelines:

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

- aa. The extension period must not exceed 3 months. DE extensions beyond 3 months may only be granted by Commandant (CG-CVC). Requests for all extensions must be forwarded with recommendations to the appropriate office, via the chain of command.
- bb. In all cases where an extension is granted (except for Great Lakes vessels), the extension date will be the new drydock base date. That date will be back dated to the actual DE due date.
- cc. In all cases (except for DE extensions for 30 days or less), the OCMI will conduct a pre-drydock extension examination to determine the material condition of the vessels. OCMI recommendations concerning the DE extension requests must be forwarded with the DE extension request for further consideration.

- [12] Guidance for drydock examination interval extensions. The revised drydock regulations require that certain vessels in salt water service be examined on drydock twice within any 5 year period, with no more than 3 years between any two examinations. This requirement prevents a vessel from ending a 5-year drydock period with a 3-year interval between dockings and beginning the next period with another 3-year interval.
- [13] Extensions of drydock examination intervals. Extensions to drydock examination intervals will not normally be considered, except under unusual circumstances. Examples of unusual circumstances are the sudden unavailability of drydock space (e.g., due to high river stage, weather damage to facilities, or the scheduled drydock facility unexpectedly going out of business), the employment of the vessel where it cannot be replaced without risk, or circumstances clearly beyond the owner's control. Singularly, financial hardship is not a valid reason for granting a drydock extension. Requests for drydock examination interval extensions forwarded to Commandant (CG-CVC) should be sent via the chain of command with endorsements that provide recommendations. The recommendations made by the OCMI and the District (p) officer are necessary to properly evaluate the request. Every effort should be made by the OCMI to ascertain and indicate the material condition of the vessel in question.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

- e. Administering extensions. If an extension is granted, it should extend the affected exam to no later than the date to which the extension was requested, or shorter if necessary to meet other requirements discussed above. MISLE must be updated accordingly to reflect the extension dates. If the OCMI deems it appropriate, the COI should be reissued with a statement under "Conditions of Operations" reflecting that hull exams have been extended.

5. Documenting Freshwater Service

- a. The OCMI should require whatever documentation considered necessary to ensure that only vessels that qualify for a fresh water DE exam interval receive one. Upon acceptance of satisfactory documentation of fresh water service, the OCMI should allow a longer DE interval as provided by the regulations for fresh water service and amend the COI accordingly. The vessel's service should be evaluated annually for extensions up to the standard intervals allowed for fresh water service.
- b. OCMI's may add a "Fresh Water Only" restriction to a Lakes, Bays, and Sounds route endorsement as an alternative to requiring letters that document fresh water service. These route restrictions should be made only at the request of the vessel owner. Due to the length and detail of modern COIs, lengthy route endorsements or restrictions to limit salt water exposure are discouraged.

6. Impact of Lay-Up on Hull Examination Schedules

The following apply to vessels with a 2.5-year DE interval that are drydocked when they come out of a lay-up period:

- a. A vessel for which the lay-up period exceeds 6 months is subject to the following criteria if more than 2 years have elapsed since its last drydocking:
- (1) The hull exam cycle when coming out of lay-up will start anew with the re-activation hull exams. The next hull exam will be required between 2 and 3 years after the activation DE, the actual date being the owner/operator's choice.
 - (2) All hull examinations, i.e., DE, ISE, CTIE, underwater survey (if approved by the OCMI and applicable), and tailshaft exam, are included.
- b. For a vessel coming out of a lay-up period of less than 6 months, when more than 3 years have elapsed since the last drydocking, the next required drydocking need not be less than 2 years.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

- c. Vessels coming out of lay-up periods of any length, but for which less than 3 years have elapsed since the last DE, must be subject to the normal 2.5-year hull exam intervals.

B. CONDUCT OF HULL EXAMINATIONS

Vessel owners or operators are responsible for preparing the hull, through-hull fittings, shaft(s), propeller(s), rudder, tanks, voids, and other confined spaces, as appropriate, for any hull examination. This includes cleaning, disassembling, gas freeing, testing for toxicity, and ventilating.

The inspector should normally conduct the examinations in the company of a vessel representative (port engineer, ship's officer, etc.), as well as any other interested parties or agencies (a classification society surveyor, an insurance underwriter, a shipyard representative, etc.). Whether accomplished in one visit or over a period of time, each particular exam should consist of a careful inspection of all accessible parts of the vessel's structure, fittings, and appurtenances, as appropriate.

The inspector should call deficiencies to the attention of the owner's representative at once. When deemed necessary, the inspector should note requirements for correction of deficiencies on Vessel/Facility Inspection Requirements, Form CG-835. Discussion of the vessel's condition and alternate methods of repair should result in adequate repairs with the least disagreement over methods and extent of repair.

The marine inspector must be satisfied that the vessel can operate safely. In cases of severe damage, controversy, or unusual circumstances beyond the inspector's experience, the OCMI should be notified immediately.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

MSM Volume I, Administration and Management, COMDTINST M16000.6 (series), Chapter 10, contains Coast Guard occupational safety and health policy for marine safety personnel.

NVIC 5-82, "Fixed Ballast," contains guidance on permanent ballast tanks, corrosion inhibitors, test plates and ballast mediums.

2. Drydocking Exam for Credit

All vessels in drydock must be cleaned and their fittings opened to the extent necessary for the inspector to determine the condition of the underwater body and fittings. Past casualties have indicated a need to examine fittings in the underside hull that might be hidden by keel blocks. When it is known that docking plugs are fitted in the hull, the inspector should ensure that they are also inspected when the vessel is in drydock.

- a. Drydocking in excess of requirements. When a vessel is drydocked for repairs to the underwater body or fittings, or for other purposes in excess of the requirements for complete periodic inspections, an examination should normally be made by an inspector.
 - (1) This examination should be sufficient to determine that all repairs are adequate and that the vessel is safe for continued operation. If the owner or operator requests credit for a drydocking after the vessel has already been hauled out, a complete examination for credit should be conducted if the OCMI has the resources available to dedicate an inspector to the job.
 - (2) If the drydocking is not for full credit, the inspector should examine the underwater hull structure and fittings to the fullest extent practicable under the circumstances. In such cases, the degree of preparation and opening of fittings may be less in scope. This policy does not prevent the inspector from conducting such reasonable inspections or requiring reasonable cleaning or opening of fittings, as deemed necessary to determine that the vessel's condition is safe for continued operation. However, excessive or arbitrary requirements for the cleaning or opening of fittings are not desired.
 - b. Drydocking of T-Boats. For vessels inspected under 46 CFR Subchapter T, an inspector need not attend every drydocking that is not for full credit. An inspector must attend each of the periodic drydockings required by 46 CFR 176.600.
-

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS****3. Internal Structural Exam (ISE)**

The ISE requirement is in addition to the statutory requirement to determine the suitability of the hull structure at the time of a vessel's COI, as required per 46 U.S.C. 3305 and 3307.

The scope of an examination of the vessel's structure during an inspection for certification that does not include a DE is left to the discretion of the OCMI. The OCMI should use the results of the more recent ISEs when assessing the suitability of the structure for the intended service at the time of certification. This concept is not new and has essentially been applied anytime a COI was issued as the result of an inspection that did not include a drydocking.

4. Cargo Tank Internal Exam (CTIE)

The scope of the CTIE exam consists of an examination of the internals of all cargo tanks, including, but not limited to, framing, piping, sounding devices, closure devices, and all attached appurtenances. This exam does not extend to pressure vessel type cargo tanks, which are being addressed in a separate regulatory project.

5. Internal Examination of Integral Fuel Oil Tanks

In order to promote safety and to comply with the recommendations of the National Transportation Safety Board resulting from the sinking of the GLOMAR JAVA SEA, the internal examination of integral fuel oil tanks is now required.

- a. Timing. The fuel oil tank examination intervals are structured to permit alignment with the similar load line requirements (46 CFR 42.09-15) and the ABS special survey standards (e.g., our regulations require ABS third special survey standards to be met by vessels 10 years of age or more but less than 15 years of age). This 5-year window, and other similar windows, will enable vessel owners to schedule fuel tank examinations as required with the vessel's ISE, or to coincide with the DE, if desired.
 - b. Selection of tanks to be internally examined. As with the ABS Rules, the mandatory internal inspection of a representative sampling of fuel oil tanks only applies to double bottom tanks. Integral non-double bottom fuel oil tanks do not need to be cleaned out and internally examined if the marine inspector is able to determine by external examination that the general condition of the tanks is satisfactory. When selecting those tanks to be internally examined, due consideration should be given to the results of the external fuel oil tank examination as well as previous inspection records to ensure that, as appropriate, a variety of tanks are entered during the life of a vessel.
-

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS****6. Examination of Tank Vessels**

- a. Introduction. Coast Guard inspectors focus their attention on certain unsatisfactory conditions found on tankships as a result of casualties, information furnished through crew complaints, and individual examinations of vessels by headquarters representatives. These include the following:
- (1) Deteriorated underdeck and side shell longitudinals.
 - (2) Fractures in bottom transverses, bilge brackets, and web frames, particularly in areas where stress raisers are found, i.e., "notches" caused by rat holes, lap joints, square cutouts, and improperly radiused transitions.
 - (3) Severe general wastage of internals in tanks or compartments exclusively used for ballast or as cofferdams.
 - (4) General wastage by corrosion of deck piping, expansion trunks, and pipe brackets.
 - (5) General wastage and severe binding of the required remote control reach rods.
 - (6) Deterioration of through hull fittings, spool pieces, and expansion joints.
- b. Hull examinations. The findings noted above, coupled with observations of the overall condition of several older tankers, indicate that the scope and caliber of inspections have occasionally been unsatisfactory. To ensure complete coverage of a vessel of any age during an inspection cycle, the scope of DEs, ISEs, CTIEs, underwater surveys, integral fuel oil tank examinations, inspections for certification, annual and periodic inspections should be recorded as follows:
- (1) The inspector should sign the "Remarks" section of Inspection Books, CG-840, after indicating each internal compartment that was not examined and why.
 - (2) Signed entries should be made on Vessel Inspection Record, Form CG-2832, indicating each internal compartment that was examined.

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS**

NOTE: Inspections of double bottom and other tanks and cofferdams should be carried out during internal structural examinations, although such spaces may be inspected during an inspection for certification, annual inspection, periodic inspection, or drydocking. In all cases, all gas-free compartments of ocean and coastwise tankships (with the exception of fresh water tanks) should be examined internally at vessel DEs, underwater surveys (if approved and applicable), ISEs, CTIs, integral fuel oil tank examinations, inspections for certification, annual and periodic inspections. If, at the time of an inspection, the OCMI is not satisfied that these compartments were examined during the previous inspection, an appropriate gas-freeing requirement should be made to permit such examination.

- c. OCMI should consult MISLE or contact one another to obtain appropriate records to ensure that internal compartments are examined as required.
- d. In addition, the OCMI should take such steps as considered necessary to ensure that thorough examinations are made to detect the conditions described in subparagraph B.6.a above. Particular care should be taken to examine all structural members and areas subject to wastage by corrosion from cargoes or salt water.
- e. Examination of vessels built with reduced scantlings.
 - (1) Very Large Crude Carriers (VLCCs) and Ultra Large Crude Carriers (ULCCs) present a unique inspection problem due to their size, lighter construction, and susceptibility to corrosion.
 - (a) Experience has shown that vessel age is a much more important factor for inspection of VLCCs than for conventional tankers. Vessels built to reduced scantling standards should be indicated by a special notation on their COI. These vessels have less corrosion allowance and are required to have tank coatings as a condition of construction. The proper use of thickness gauge readings and inspections of tank coatings and corrosion control systems are therefore very important.
 - (b) Accelerated corrosion loss has been prevalent in cargo/dirty ballast tanks, flume openings, and bottom shell plating. Crude Oil Washing (COW) has also presented localized wastage problems due to direct impingement of crude and cleaner on surfaces. Tank coating conditions must be noted in the inspection narrative and coating restoration will be required if existing coatings have failed.

USCG Marine Safety Manual, Vol. II: Materiel Inspection

SECTION B: DOMESTIC INSPECTION PROGRAMS

CHAPTER 3: HULL EXAMINATIONS

- (2) CTIE. The size of cargo tanks on ULCCs and VLCCs presents a special problem in the examination of underdeck structural members.
- (a) Methods of conducting an inspection have included rafts, high-powered lights with binoculars, special cranes, and catwalks. Although enhanced special surveys require “close up” inspections, conventional climbing about with a flashlight or staging methods are neither safe nor practical in larger cargo tanks. The method of tank inspection should be discussed and approved in advance of the vessel's scheduled inspection whenever possible.
 - (b) The raft method can be hazardous and should be conducted only with the OCMI's specific approval.
 - (c) Catwalks or other permanent in-tank structures may not be safe due to weakening from accelerated corrosion.
- f. Tank barge examinations.
- (1) The longer drydock intervals were established with the intent that the required intermediate ISEs would be thorough. It is imperative that a complete examination of internal framing, hull plating, and tank boundaries in the void and ballast spaces is conducted. The regulations allow an OCMI to require a vessel to be drydocked or otherwise taken out of service, if, during an ISE, damage or deterioration to the hull plating or structural members is discovered.
 - (2) Externally framed tanks. The 10-year CTIE interval permitted for double hull barges with externally framed gravity cargo tanks is applicable to those tanks that are externally framed on both ends, both sides, bottom, and top. Double hull barges with framed bulkheads in the cargo tanks, or with trusses, girders, or stanchions in the cargo tanks, qualify for the externally framed intervals as long as the exterior cargo tank envelope is externally framed (all six sides). In addition, on an interim basis pending inspection results per Subparagraph A.4.d(4) above, double hull barges that are externally framed with the exception of the deck must be considered to be externally framed. This policy must be applied to all 46 CFR Subchapter D and I double hull barges, and to those carrying 46 CFR Subchapter O products that have a "G" in the last column of 46 CFR Table 151.05.
-

SECTION B: DOMESTIC INSPECTION PROGRAMS**CHAPTER 3: HULL EXAMINATIONS****7. Examination of Permanent Fresh Water Ballast Tanks**

Ballast tanks containing permanent freshwater ballast may be exempted from internal inspection under the following conditions.

- a. The ballast fluid is chemically tested to ensure that its corrosion-inhibiting properties are still effective. The test sample should be taken from mid-depth in the ballast tank.
- b. The corrosion test plate is examined to ensure that the ballast tanks are free of corrosion.
- c. An external examination of each ballast tank, to include bottom shell plating, tank top, and all internal structural members that constitute the exterior of the ballast tank, is conducted to the extent practicable to determine the external condition of the ballast tank.

NOTE: When significant corrosion is found, structural damage is evident, or the permanent ballast medium is determined to be inadequate, the OCMI may require that the subject tank be made gas-free (if necessary) and available for internal inspection.

C. UNDERWATER SURVEYS INSTEAD OF ALTERNATE DRYDOCK EXAMINATIONS

In December 1980, the Coast Guard published a research report, "1980 Underwater Technology Survey for Extension of Time Between Drydockings" (National Technical Information Service (NTIS) Report ADA 101-131). This report indicates that current technology, properly applied with additional administrative and operational controls, can provide a satisfactory means of inspecting the underwater bodies of vessels without them being hauled out.

Underwater examinations using video equipment have been accepted on occasion by the Coast Guard as a means of verifying the continuing acceptability of the structure of large MODUs since 1969.

Since publication of 46 CFR Part 107 in 1978, underwater examinations for column-stabilized and self-elevating MODUs have been allowed by regulation.

The revision of the drydock and tailshaft regulations in 1988 provide the option of alternating DEs with underwater surveys to owners and operators of tank vessels, cargo and miscellaneous vessels, and oceanographic research vessels less than 15 years of age, and also permit continued participation in the underwater survey program for vessels 15 years of age and older.

Vessels older than 15 years of age which have not previously participated in the underwater survey program are still eligible.

1. Entry into Underwater Survey Program

- a. Pre-survey drydocking. An owner who desires to enter his or her vessel into the underwater survey program must first drydock the vessel. The purpose of this drydocking is to conduct a preliminary survey of the hull to evaluate its condition and the feasibility of conducting an underwater survey. This survey and the video discussed in Subparagraph C.1.d below are to be used as a reference for the first underwater survey once the vessel has been approved for the underwater survey program.
