RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Nile Arena  
400 W Wilson St  
Bloomington, Indiana 47403

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Steve Sheehy

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Dudley And Candace Campbell

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jan Monical

It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

A.C. MCGARRY

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Kay Reinfried

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Leslie Lund

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Robert Chirpin

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Keith Brown & Teresa Robbins

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Bonnie Margay Burke

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

pinkyjain pan

In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Samuel Durkin

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Donald Garner

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Thomas Dawley  
North Truro, Massachusetts 2652

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Deb Hirt

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jeanine Fair

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Carol Garber

Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Marta Guttenberg

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Michael G Smith  
Ashland, Oregon 97520

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Virginia Mendez

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

June Cattell

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

MARTY BOSTIC

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Harriet Edith Roberts  
2510 Woodland Dr

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Thomas Smith

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Mark Coates

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Patti Jo Arcana

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Beth Jane Freeman

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Brieaux Poche

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Elizabeth Carol Edwards

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Maryellen Redish

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

D'anne Macneil

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Bryan Lilienkamp

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

sheryl post

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Linda Petrulias

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Gerritt And Elizabeth Baker-Smith

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Randy Harrison

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Brianna Claire Olson

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

A. Todd

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Caryn Cowin

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Mike Butche

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Larry Hunt

Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

JOANNE KELLY

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Erik Kingfisher

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Gabriel Pelly

It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Marianne Edain  
Langley, Washington 98260

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Noel Orr

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Amanda Salvner

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

No More Dirty Fuel!!

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Mary Whitehead

In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jana Vitols

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Lane Hatfield

It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Robert Meyer

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Trina Cooper

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Bay Renaud

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jacqueline Chambers
