To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Marilyn Lindahl

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Michael And Barbara Hill Hill

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Sophia Keller

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Shasta Smith

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Brett Johnson

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jean Davis

It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Chris Butler-Minor

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Joel Stewart

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Joan and Tom Harris

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Dennis Lengel

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Judy Avery Wayle

In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Gary Brill

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Judith Landau

It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Connie Nelson

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Susan Kiplinger

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Robert Earl

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Victoria Forsberg

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Lois Hanson

Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Nicole Southwell

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Joshua Christian

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Barbara Gross

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Llyod Johnston

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Thomas Hernandez

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Virginia Davis

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Carol Holding

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jim Hackman

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Lloyd Hedger

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Marc Conrad

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Patrick McKee

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Lane Lucht

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Katrin Sippel

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Randi Holland

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Peter Reagel

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Michele Paxson

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Cheryl Summerlin

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Nicholas Curtright  
Anacortes, Washington 98221

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Jean Avery

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Norman Baker

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Guila Muir

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Ryan Nelson  
Colorado Springs, Colorado 80919

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Janice Wilfing

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Linda Hartley

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Wendy Feltham  
552 Cook Ave

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Sharron Coontz

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Craig Jacobrown

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Carol Kibble

Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Laura Alskog

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Harold Treinen

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

June MacArthur

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Shane Yellin

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Kirk Kirkland  
3114 N Alder

Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Maradel Gale

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Karen Carbonneau

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Derek Benedict

Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Christopher Buckley

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Steven Gary

The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Tracy Ouellette

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Timothy Muirhead

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Steve Lucas

Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Kim Rice

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Aleks Kosowicz

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Kim Thomas

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Marius Wasbauer

Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Brian Kelly

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Merna Blagg

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Andrea Faste

Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Lee Schmidt

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Henry Matthews

In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Eric Wollscheid

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

James French

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Sharon Miller

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Hoa P

RE: Comments on Washington State Oil Spill Contingency Plan Rule Update Chapter 173-182  
WAC

Dear Ms. Larson,

I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. I am concerned about the risks that tar sands crude oil poses to my community and communities across Washington State. I appreciate the work that the Department of Ecology has done thus far to improve oil spill prevention, preparedness, and response measures over the last several years, but am concerned that the proposed updates to Washington's Oil Spill Contingency Plan Rule does not go far enough to protect us from a worst case scenario spill of tar sands crude oil.

Communities across Washington are already at risk from the existing transport of tar sands crude oil and we unprepared to respond. Currently tar sands are transported by rail through Eastern Washington and along the Columbia River, by barge across Puget Sound, and through the Puget Sound Pipeline across Whatcom and Skagit Counties. The proposed expansion of the Canadian Trans Mountain Pipeline would exacerbate these existing risks and increase the likelihood of a catastrophic oil spill of diluted bitumen. In addition to being one of the most climate-polluting fossil fuels on the planet, heavy tar sands crude oil sinks when spilled into the water and is virtually impossible to clean up, causing irreparable damage to our economy, communities, and endangered orcas and vulnerable ecosystems.

To address these risks, Ecology should require a fast, aggressive, and well-coordinated response to contain and recover potentially non-floating oils before they submerge and sink. The timeframes required in the draft rule provide no assurance that the current response times and capability will be sufficient to respond to a worst-case spill. Ecology should distinguish between all potentially non-floating oils and diluted bitumen, which is likely to sink quickly and therefore demands more stringent equipment and response time requirements.

Finally, I urge Ecology to enhance planning standards for wildlife response in the event of an oil spill. It is essential that wildlife response actions are initiated as soon as possible with adequate personnel and equipment. Deterrence actions that keep wildlife from entering a spill must be underway immediately after a spill. The Plan must require that the monitoring and deterrence operations apply to all killer whales. This will provide greater certainty that Southern Resident orcas will be deterred from entering an oil spill. I urge Ecology to exercise its full regulatory authority and establish stronger protections from tar sands oil that Washington needs and deserves.

Sincerely,

Thomas Pollock
