

## Kacie Bell

Due to drastic need for road and railway development along with the emissions associated with the transportation of raw materials, is the Newport location the ideal place for the smelter plant? The access to cheaper high power that the location offers does not outweigh the costs of the development necessary to facilitate coal, quartz, and woodchip delivery from distant sources; nor the cost to the regional environment. If imports to the location require a complete development of the site to operate, it is not worth the extensive costs.
