

## Margaret Underwood

It is well known that silicon smelters typically run into issues causing the furnaces to be turned off. It is known that toxic emissions and noxious fumes increase during the cooling and reheating of the furnaces. I want DoE to research 5 silicon smelters from start up through 2 years and report the data re: # of shutdowns. I want DoE to take the average and quantify the additional emissions. I want this data to be added to the emissions pacwest is currently projecting. Consider this information in the EIS.
