

## James Chandler

Much grading of the proposed smelter site will be required for construction. This change of topology will affect the area greatly. Will the DOE require full hydrologic study of the site prior to grading? Will this grading affect the local environment--such as natural game crossings? How much grading will be allowed? Where will the graded material be deposited? What is the effect of graded material deposits on the local environment? Will the graded material be used for road construction or perhaps rail levees? What is the effect of using this material for these purposes?
