

Phyllis J. Kardos

PacWest will be producing industrial waste during its construction period and during its silicon metals smelter operations. Identify all industrial waste that will be produced and how it will be disposed? Will there be any industrial waste disposed on the location? Where will be the closest industrial disposal site and how will the industrial waste be transferred and transported to the disposal location? Who will monitor the industrial waste from the construction period and the operational period? How much of this waste will be treated as contaminants? How will it effect the environment in the area where it is disposed?
