

Dallas Becker

Dear Mr Pfeifer and the Dept of Ecology

Please force PacWest to provide more information. What in the world is being scoped. PacWest has not been forthcoming in the details of this project and the information that they provide to the public keeps changing: the amount of water? where the water will come from? The amount of pollution that will be created?

Ecology must evaluate the smelter with all required methods of possible pollution prevention. The EIS must assess the following potential impacts by the project including any associated operations: transportation, wood-chipping and charcoal production.

Please look deeply into the impact assessments on the health of the people and animals :direct inhalation of all forms of emitted pollution, inhalation of secondarily formed air contaminants, ingestion of contaminated food from atmospheric deposition in the airspeed of persistent bioaccumulative pollutants, loss of food resources caused by project-related impacts on the environment, increased risk of injury or death from related transportation aspects supporting the project, impacts of mental well being of people living in the areas impacted by the smelter, in particular those living within view of the smelter .
