

Pam Hibbard

We own property in Northern Idaho downwind of the proposed smelter. Emissions concern me greatly. There are always claims there won't be a problem, then later find out there were statements made that are not accurate. Will this cause acid rain issues? Is there aggressive monitoring to be done. Will the smelter be shut down if the emissions cause pollutants in our air and water? What was this land originally zoned for.

Most of the time, seems like monitoring is not looked at until there is a problem. Then if emissions are excessive, little or nothing is done.

These things affect PEOPLE. I think the Canadians should build their smelter in Canada. They think we are easy and dumb so they want us to say yes. Let's be smart for a change and say No. get Amazon to build a non polluting distribution center instead. Thank you.
