

## James Daniels

It seems to me that allowing a smelter in such a pristine natural environment is just asking for an environmental catastrophe. I have read that this smelter would not be allowed to operate in Spokane because it would put enough particulates into the air as to raise air quality to un-safe levels. If this is true then it makes sense that PacWest would want to find a place with clean air so that their emissions won't make the area affected un-safe, as far as air quality. This proves two things.

#1 This operation will most definitely pollute a pristine environment.

#2 It also proves that this foreign company could care less as long as they can make more money.

As an Idahoan, I am very much opposed to allowing this smelter to be operated anywhere near where the particulates will fall into our rivers, lakes and water sheds. Tell PacWest to go back to Canada and fowl up their own countrys air and water.

Sincerely, James Daniels
