A short addition to my earlier figures about the exponential functions
There are two types of feedback loops: the Negative reinforcing feed
back loops and the Positive reinforcing feedback Loops.

There are somewhere around 1000 dead zones in all bodies of water around the Earth
and are increasing at alarming rates. The two largest are 1) The Baltic Sea,
and Two the Oman in Arabian Sea. I mentioned earlier about fires and floods.
Much smaller bodies of water will no doubt increase with soil erosion washing in
Nutrients and Organics with the hurricanes and fertilizers with nutrients causing
more localized dead zones. Also of note is the number of Positive feedback Loops
that have been identified. I believe there are over 60 of these feedback Loops.
So keep ever vigilant and keep looking up! Thank you!
