

Dear Ms. Schreiner,

Thank you for the opportunity to comment on your permit proposal. I have several comments detailed below.

I believe that the standards you are proposing for groundwater are excellent. I would not change them.

I am very concerned about stormwater. Please include requirements to protect our homes from stormwater run-off.

It is nice to know that there are requirements for recycling. Please also consider mandating curb-side recycling.

I hope that the odors from processing at the plant will be under control. Please make sure there are requirements for odor control.

Can the permit include hours of operation requirements so that the noise from operating machinery is not bad in the middle of the night?

Will there be any nuclear materials managed at this location?

There is so much unknown about chemical impacts, will this permit require them to collect data on chemical impacts?

Industrial waste can be messy, what requirements are included for how they manage industrial waste?

The permit holders should not be allowed to use household waste to dispose of things related to this permit.

Do they need a water right to operate this permit?

Will they be required to have a spill response plan?

What requirements do they need to have in place to prevent a spill from happening?

I think two hours of training is not enough. You should require them to have 120 hours of hazardous materials training.

Thank you for your time and consideration of my comments.

Sincerely,

Bari Schreiner
