

Janet Hays

I live in a community that is exposed to emissions from a grandfathered asphalt and cement plants. We have tried since the City of Kenmore was incorporated to have testing done. The visible and physical health symptoms affect the north end basin of Lake Washington. PSCAA(a misnomer)is who we are told to call. You will never know the extent of green house gases from the cement and asphalt industry .PSCAA chooses to have only one method of testing and that is their nose. They only accept complaints if emissions can be smelled. The state will have to stop PSCAA. They are in business with Sand Gravel, mining, oil refineries etc. They issue permits that allow emissions to occur. That is their revenue. The Washington State needs to stop funding PSCAA. We here in Kenmore and the world need help. Recycling of Concrete and asphalt and the process has contributed to this as well. The state, DOE need to oversee cleanup of existing MTCA sites. Do not continue the practice now used allowing voluntary clean up by the liable landowner's. It has been made to easy by having the fox guard the hen house.
