

Stacey Valenzuela

Stacey Valenzuela, S-T-A-C-E-Y V-A-L-E-N-Z-U-E-L-A, from Kenmore. The residents and environmental organizations count on ecology to protect our resources, air, water, and land. To really make a difference we need to stop our biggest sources. We need to stop enabling greenhouse gases by buyouts. Some have suggested a dividend to be payable for those not in compliance to residents, all residents. I would suggest a need for those that need inhalers, treatment, air purifiers, or cancer treatment that live closest to the emissions, uh, 200-- 2,000 to 3,000 feet, especially. The people suffering that are usually can't afford are usually less fortunate and cannot afford treatments. Also, I think we need real local testing, not just sampling from a chart. And part of that was the asphalt emissions, ER-47 from the California EPA that they suggested had their own problem in 2020, November of 2020. However, it is June of 2022 and still that formula is being used. The goal should be to exceed, not just meet, increase the pricing for all fines and allowances to make it harder to take no action by these companies and sources. Also, it would encourage them to decrease the emissions and also have their emissions by the best science practices and the best testing in latest technology. We need to cut back the time to act. We can do only so much at the individual level, but we can make a big difference if the businesses and the sources are cutting that greenhouse gases. We need to take action. We need cleaner air, water, and land before it is too late. The Climate Commitment A-Act is just words unless we take action now. Thank you.
