

Eric Shaw

My suggestion to reduce carbon emissions is cutting back the use of cars and add in alternative mode of transportation.

Investing more in public transportation such as trains, buses, and trams would get more people out of cars and would even increase traffic speed.

Besides public transportation there are other community funding for bike lanes so people don't need to interfere with traffic and doesn't use a single ounce of gas. There won't be carbon emissions from bikes.

Finally, let's get rid of single family zoning because single family homes encourage low density living and relies on cars. It would be more efficient to move 200 people from one lot than 20 people.
