

## Alex Dail

The move to EV ought to be a free market choice and not manipulated by laws or price control of petroleum. The whole feild of vehicles that use petroleum ought to be considered; that is how it will affect farming, the moving of goods and produce (the effects on pricing of perishable and nonperishable items) etc. If left to the market the market will choose the "best mouse trap" and we would not be burning energy bridges that we later wish we were still connected to when an unforeseen energy crisis occurs.
