

Doug Lyons

I am not in favor of legislating what kind of energy we should use in our vehicles. You should concentrate on improving the electrical grid and let the market place determine whether one should choose to select an electric vehicle, hybrid, or petroleum. Scientist all agree that this switch to all electric vehicles will have little or no effect on global warming as it is mainly controlled by decade long modal changes caused by the sun and its effects on the oceans and ice fields etc. It is a function of complex energy transfer as any thermal engineer can attest. CO2 has a mostly good effect on plant growth as evidenced by the greening of large portions of the earth. I know that doing what you are doing will be disastrous for our economy that is for certain. We have to get back to be energy independence we need all forms of energy. Work on improving the electrical grid.
