

Dan Moline

Has anybody thought about when they do away with fossil fuels, mining "How are they going to make batteries for the EV? What about all the infrastructure jobs on highways (Big Equipment) Requires much more voltage to charge and they will need bigger batteries to run on EV style save the planet? What about the airline industry (jet fuel)? This is not a well thought out plan. Let's just say that the U.S. got rid of gas, deasil killed the oil industry and maybe 50% of the vehicles are EV, imagine all the wait time for charging, the cost of electricity in doing so, people always late to work, appts. I know some rich folks just because they can buy and own EVs, every time something goes wrong with vehicle it takes weeks and months because of supply chain failure and because the market is not fully supplied with parts to deal with it? And by year 2035 most people are not going to give up their cars!
