regardless of what 'fuel' we harness, it'll have a predetermined availability - for electricity, we'll still need water (and wind) power, erecting cables and whatever (no CONstruction without first DEstruction), and this without even discussing the failures inherent already in 'electric' vehicles. The limited amount of a charge, the necessary replacement of all gas stations to electric ones which take much MUCH longer to 'fill' up, the fact that power outages themselves are more frequent without everyone forced to own one of these disasters whether they want to or not, and it appearing as further evidence that freedoms, voices, democracy, choices, and the lack of voting things in or out no longer exists (not that voting is ever honest or trustworthy in the first place). Lastly, over-populated places already suffer from frequent power outages which will only increase with the additional loads to 'fuel' billions of vehicles (cars, trucks, buses, whatever). Lousy (and temporary) 'fix' for a serious issue. Somebody needs to actually think long and hard first before instituting and hopefully, come up with something doable. DON'T FOLLOW GAVIN'S LEAD - HE'S AN IGNORANT, ARROGANT FOOL unless there's more to it than meets the eye.
