

## Ray Garvey

From a scientific basis, clean diesel has drop for drop more power and fewer emissions than gas or propane. Battery power is the lowest power on the list. It merely shifts the power generation to an offsite location using a far less efficient fuel to generate the power. For a fuel to be sustainable it must reduce consumption, create less waste, and be profitable (affordable). Mandating electric cars in the foreseeable future is foolish and arrogant. Don't forget the poor children in the dirty lithium mines if you really care about people and the environment.
