

Ernest Wohleb

The technology for electric is not ready for mass transit needs. Electric vehicles have proven to be unsafe with lithium batteries having the potential to self destruct with a rather large fire that is extremely hard to extinguish.

Lithium mining is more destructive to the environment than current gas usage. What do to with batteries that are no longer viable hasn't been addressed. The cost of the vehicles is out of reach for a large segment of the population. Where do you people get off deciding on what we the people want to drive.
