

Douglas Hale

We do not have the infrastructure to support a change to all electric cars by 2035. Without building larger power plants which will add to pollution and take decades to get built due to regulatory demands it just isn't feasible. How can anyone with ANY common sense think that millions of electric cars competing with millions of homes for power could possibly occur in our lifetimes? How will this get paid for? Taxes are too high for most people at current rates. I feel government needs to slow down and do a little forward thinking about the ramifications of this should you stick to a 2035 deadline.
