

Mark Pomerinke

EV cars would be great if everyone working person could afford one and there was an operational power grid in place to handle their charging requirements. Forcing EVs on everyone before systems are in place to meet the requirements of buyers and charging stations in Washington will put this state in the same state as California which is experiencing multiple problems. Since the biggest producer of pollution is our large cities, lets focus on reducing emissions in those areas first before mandating EV cars to rural areas where most cannot afford EVs and charging stations would be a real problem.
